The Discharge Potential of Chlorine Ions. By ERICH MÜLLER (*Zeit. Elektrochem.*, 1900, 6, 573—578, 581—583).—The discharge potential of chlorine ions in normal hydrochloric acid, against a normal hydrogen electrode, has been measured as 1.31 volts; this is also the E.M.F. of the hydrogen-chlorine gas cell. The author discusses the reasons for believing that hydrochloric acid acts as a depolariser for chlorine, and that the E.M.F. of 1.31 volts really indicates the beginning of a chemical reaction between the chlorine and the solution, and does not correspond with the liberation of free chlorine. His measurements show that in a normal solution of hydrochloric acid or of common salt, some other change begins at the anode when the P.D. between it and the solution is 2.2 volts (or about 1.9 volts measured against a normal hydrogen electrode).

Whether this change is the liberation of free chlorine is undecided, but the author considers that it is the one on which the electrolytic formation of chlorates mainly depends. T. E.

Migration Constant of Sulphuric Acid. By ARTHUR KENDRICK (*Zeit. Elektrochem.*, 1900, 7, 52).—Thermodynamics shows that the E.M.F. of a concentration cell depends (among other things) on the migration constant of the electrolyte. The author has measured the E.M.F.'s of concentration cells containing (a) hydrogen electrodes, (b) lead electrodes, and (c) lead peroxide electrodes in sulphuric acid of different concentrations. By means of these measurements and the equations mentioned, he calculates the values of n for hydrogen in sulphuric acid of various strengths. The results agree with the numbers obtained by other observers by measuring the changes of concentration at the electrodes (Hittorf's method) about as well as these numbers agree with each other. T. E.

Apparatus for Illustrating the Migration and Separation of Ions. By ERICH MÜLLER (*Zeit. Elektrochem.*, 1900, 6, 589—591).—The apparatus is designed for lecture illustration, to show the separation of equivalent quantities of the ions at the electrodes, and also the accompanying changes of concentration due to their different velocities. Blocks of wood suitably marked to represent the ions

slide horizontally past each other on wooden bars at different velocities. The different velocities are obtained by strings attached to pulleys of different size. When the blocks reach the ends of the bars they fall off in order to represent the separation of the ions from the solution. For details of construction, the figures in the original must be consulted.

T. E.

Electro-synthesis of Organic Substances. By OCTAVE DONY-HÉNAULT (*Zeit. Elektrochem.*, 1900, 6, 533—543).—Reactions between non-dissociated substances and discharged ions are considered. In order that an ion shall part with its electrical charge, a certain difference of potential (the discharge potential) must exist between the electrode and the electrolyte. When the solution contains a substance capable of reacting with the discharged ion (a depolariser), the discharge potential is diminished. The discharge potential is measured by the method of Bose (*Abstr.*, 1899, ii, 348). Ethyl alcohol, acetic acid, acetone, acetaldehyde, quinol, and especially phenol, act as depolarisers for Cl and Br. Bromophenols may be prepared by the electrolysis of a solution of hydrobromic acid and phenol in acetic acid.

The oxidation of methyl and ethyl alcohols is studied more fully. The discharge potential of OH ions from 0.9 normal sulphuric acid, for example, is diminished by about 0.5 volt by the addition of about 20 per cent. of ethyl alcohol, whilst an equal quantity of acetaldehyde has practically no effect. Ethyl alcohol is therefore more readily oxidised than acetaldehyde, and by using a sufficiently small E.M.F. it should be possible to oxidise alcohol to acetaldehyde quantitatively. This is shown to be the case. With higher E.M.F.'s, and a correspondingly higher current density, ethyl hydrogen sulphate is also formed.

Formaldehyde was not obtained from methyl alcohol.

The order of activity of chemical oxidising agents is given by the E.M.F. which they develop in a so-called oxidation cell. By the use of an oxidising agent, giving a sufficiently low E.M.F., it should therefore be possible to attain the same results as those given by electrolytic oxidation. It is shown, in fact, that acetaldehyde is the only product of the oxidation of ethyl alcohol, in faintly alkaline solution, by lead dioxide or cupric oxide.

T. E.

Electrolysis of Fused Salts. By FRIEDRICH QUINCKE (*Zeit. anorg. Chem.*, 1900, 24, 220—221).—The author previously (compare *Abstr.*, 1889, 458) regarded the deviations from Faraday's law, observed in the electrolysis of fused salts, as due to an insufficiently high internal resistance, and he sees a confirmation of this view in the recent work of Lorenz and Helfenstein (this vol., ii, 333 and 383). He supposes that, in the case of fused salts, a conductor of the second order may be converted into one of the first order, and points out that Lorenz and Helfenstein should have taken account of thermocurrents.

J. C. P.

Electrolysis of Fused Salts. By RICHARD LORENZ (*Zeit. anorg. Chem.*, 1900, 24, 222—224).—The author criticises the views of Quincke (preceding abstract), and considers that the work of Lorenz and Helfenstein renders them untenable.

J. C. P.

Evolution of Oxygen at the Anode in the Electrolysis of Solutions of Alkali Chlorides. By FRITZ FOERSTER and H. SONNEBORN (*Zeit. Elektrochem.*, 1900, 6, 598—604).—Neutral solutions of potassium chloride were electrolysed in such a way that the concentration at the anode remained practically constant, and that not a trace of the potassium hydroxide formed at the cathode could get into the anode solution. The concentrations of the solutions varied from 0.3 to 3.16 normal. Oxygen was evolved in all cases, and hydrogen chloride formed at the anode. Traces of chlorate were probably formed in the more dilute solutions. The quantity of hydrogen chloride formed corresponded with the quantity of oxygen liberated. This quantity decreased as the concentration of the solutions increased, 6.3 per cent. of the current producing oxygen from the most dilute solution and only 0.09 per cent. from the most concentrated. These results are very similar to those obtained with hydrochloric acid. The authors conclude that, in the electrolysis of neutral solutions of alkali chlorides, the anions of water are discharged to some extent at the anode, but that, in not too dilute solutions, the formation of chlorate and the simultaneous evolution of oxygen are almost exclusively due to the hypochlorite which is first formed by the electrolysis. T. E.

Conductivity Temperature Coefficient of some Liquid Ammonia Solutions. By EDWARD C. FRANKLIN and CHARLES A. KRAUS (*Amer. Chem. J.*, 1900, 24, 83—93).—Arrhenius (Abstr., 1889, 1044) has shown that the conductivity of solutions at first increases with rising temperature, reaching a maximum value; in the case of aqueous solutions, however, the temperatures of maximum molecular conductivity generally lie too high for experimental verification. The authors, in a preliminary investigation, find that solutions of several electrolytes in liquid ammonia pass through well-marked maxima of conductivity with rising temperature. Solutions in liquid ammonia retain the power of carrying the electric current up to and beyond the critical temperature of the solution. When potassium, sodium, and lithium are dissolved in liquid ammonia, the solutions have positive temperature coefficients of conductivity. Methylamine is found to be an electrolytic solvent. J. C. P.

Propagation of Condensation Waves in Heated Gases. By HENRI LE CHATELIER (*Compt. rend.*, 1900, 131, 30—35).—The velocity of high condensation waves in gases at the ordinary temperature has been shown to be considerably greater than that of sound, a result in accord with theory. The author's experiments show that this is also the case at high temperatures, and a noticeable point is the great decrease of velocity occasioned by reflection either from the walls or from an opposing condensation wave. Thus, in a mixture of acetylene and oxygen, the velocity of 2300 was after the first reflection reduced to 1350, after crossing an opposed wave, to 1080, and after a second crossing to 980. It is also shown that, after the passage of the wave, the whole mass of gas remains in an oscillatory state. L. M. J.

Apparatus for Melting Point Determinations. By JOSEPH HOUBEN (*Chem. Zeit.*, 1900, 24, 538).—The apparatus recommended

resembles that described by Roth (Abstr., 1886, 1070), except that the bulb and inner tube are not fused together, but are ground into one another; both are provided with perforations in their necks, which are so arranged that the sulphuric acid which they contain may be in direct communication with the atmosphere or by simply turning the inner tube may be completely shut off.

J. J. S.

Liquefaction of Gaseous Mixtures. By F. CAUBET (*Compt. rend.*, 1900, 131, 108—109).—The previous work (this vol., ii, 191, 390) is extended to mixtures of methyl chloride and sulphur dioxide, and the vapour pressure curves for the mixtures are given. This case differs from those previously investigated on account of the proximity of the curves of the two constituents. Retrograde condensation was not observed, but an interesting feature is the experimental verification of the points named by Duhem the points of Gibbs and Konowaloff.

L. M. J.

Dissociation in Colloidal Solutions. By M. G. LEVI (*Gazzetta*, 1900, 30, ii, 64—70).—Potassium iodide is dissociated to the same degree in solutions of gelatin, agar-agar, or silicic acid, as in aqueous solution. The lowering of the freezing point by potassium iodide and chloride, and the velocity of inversion of sugar by hydrochloric acid, have the same values in pure water as in colloidal solutions.

T. H. P.

Relation of the Taste of Acid Salts to their Degree of Dissociation. II. By LOUIS KAHLENBERG (*J. Physical Chem.*, 1900, 4, 533—537).—A reply to Richards (this vol., 391), in which the author contends that the former only explains why the taste for low hydrogen concentrations is more marked than would be expected, but does not give any explanation of the fact that a solution of an acid salt possesses a sour taste when the hydrogen ion concentration is far lower than that at which the sour taste disappears in solutions of acids, as for example, hydrogen chloride. Hence he still considers the explanation of the taste on the dissociation hypothesis to be unsatisfactory.

L. M. J.

Solubility of a Mixture of Salts having one Common Ion. By CHARLES TOUREN (*Compt. rend.*, 1900, 131, 259—261).—An extension of the previous work (this vol., ii, 396, 530) to mixtures of potassium nitrate and carbonate. As the latter contains two potassium ions, the concentration must be doubled in constructing the curve, and it is found that only for very low concentrations of the carbonate does the curve coincide with that for mixtures of nitrate and chloride, falling below the latter very soon, and hence indicating incomplete dissociation or the formation of KCO_3 ions even at low concentrations. Mixtures of potassium nitrate and bicarbonate were also examined, but the case is complicated owing to the fact that carbon dioxide increases the solubility of the nitrate.

L. M. J.

Law of Corresponding States. By DANIEL BERTHELOT (*Compt. rend.*, 1900, 131, 175—178).—The author has previously indicated a method for the calculation of the minimum volumes of compounds,

and stated that if volumes be measured from these minima and different temperature zeros employed, the law of corresponding states is valid (this vol., ii, 335). The values of these zeros and minima are given for a number of compounds, and it is shown that these lead to results in very close accord with those deduced empirically by Madame Meyer (this vol., ii, 263).

L. M. J.

Development and Propagation of an Explosive Wave. By HENRI LE CHATELIER (*Compt. rend.*, 1900, 130, 1755—1758).—The velocity of propagation of explosive waves was measured by a photographic method; in the case of mixtures of acetylene and oxygen, the velocity of propagation of the flame is at first very great (many hundreds of metres per second), and is succeeded by the explosive wave which is characterised by a still greater and uniform velocity. The initial phenomena differ in different gases, the velocity being usually much smaller, occasionally only a few metres per second. For acetylene and oxygen, the velocity of the explosion reached a maximum of 2920 metres per sec. for the mixture $C_2H_2 + O_2$, and fell to 1850 metres for the mixture $C_2H_2 + 10O_2$, which is the limiting composition for the propagation of the wave. Other mixtures were examined, and in the case of mixtures of carbon monoxide and oxygen, it was found that when the charge of fulminate, used to induce the explosion, is great, the explosive wave does not pass, owing to its velocity being smaller than that of the compression wave produced by the fulminate.

L. M. J.

Energy of some Metallic Hydroxides deduced from the Hydrolysis of their Salts. By GIACOMO CARRARA and G. B. VESPIGNANI (*Gazzetta*, 30, ii, 35—63).—A number of measurements have been made of the electrical conductivity of, and the velocity of hydrolysis of methyl acetate by, various neutral and basic salts of iron, aluminium, &c. The results show that: (1) The basic energy of hydroxides of the metals is in accord with their position in the periodic system, decreasing, for instance, in the series Mg, Cu, Zn, Cd, Al, Fe; the assumption that ferric hydroxide is a more energetic base than aluminium hydroxide is hence erroneous. (2) Basic ferric chloride in aqueous solution is hydrolysed to a considerable extent, the basic sulphate less so, and basic aluminium sulphate much less still. (3) Even in presence of a large excess of potassium hydroxide, aluminium hydroxide forms only a potassium mono-aluminate. (4) Aluminium hydroxide acts more energetically as a base than as an acid, the degree of hydrolysis of the aluminates being fourteen times that of aluminium sulphate. (5) When dissolved in excess of not too concentrated potassium hydroxide, the oxides of lead and zinc yield respectively monopotassium plumbate and dipotassium zincate.

T. H. P.

Chemical Dynamics. Dynamical Observations on the Bromination of Benzene. By LOUIS BRUNER (*Chem. Centr.*, 1900, ii, 257—258; from *Bull. Acad. Sci. Cracow*, 1900, Januar).—In order to determine the rate of formation of bromobenzene, a bulb containing bromine was broken in the calculated quantity of benzene and the tube then sealed. After a definite time, the contents of the tube were

mixed with concentrated potassium iodide solution, and the bromine used estimated by titrating the liberated iodine. The results showed that the bromination of benzene does not stop at a limit of 50 per cent., but with a continually decreasing velocity approaches the theoretical limit. After 150 days, 94.1 per cent. was found to have been brominated. The velocity is dependent only on the concentration of the bromine, and bromobenzene has no catalytic effect on the action. The velocity is increased, however, by the presence of moisture. Experiments in which an excess of benzene was used showed that the velocity constant approached only a constant mean when calculated for a bimolecular reaction. The addition of a quantity of iodine, amounting to 1 per cent. of the benzene, increased the velocity constant ten times, whilst 2 per cent. of iodine raised its value fortyfold. By the action of 60 grams of bromine on 3 equivalents of benzene containing 2 per cent. of iodine for 7 days, a yield of 85 per cent. of bromobenzene was obtained.

E. W. W.

Velocity of the Formation of Esters from Benzoyl Chloride and Aliphatic Alcohols. By LOUIS BRUNER and STANISLAW TOLLOZKO (*Chem. Centr.*, 1900, ii, 257; from *Bull. Acad. Sci. Cracow*, 1899, 475—487).—The velocity of the formation of esters by the action of benzoyl chloride on methyl, ethyl, propyl, isobutyl, isoamyl, and isocapryl alcohols has been determined. A sufficiently large excess of the alcohol was used for the unimolecular reaction $\text{Ph}\cdot\text{COCl} + \text{ROH} = \text{Ph}\cdot\text{CO}_2\text{R} + \text{HCl}$ according to the formula $K = (1/A)(\log. A/A - x)$, and the constants K were determined. The results are tabulated in the original paper. The velocity constants were found to decrease rapidly as the molecular weight of the alcohol increased. Since they were found to become less as the time of the reaction was prolonged, other secondary actions must also take place.

E. W. W.

Lecture Experiments for Demonstrating Fractional Distillation. By P. N. RAIKOW (*Chem. Zeit.*, 1900, 24, 645—646).—The principles of fractional distillation may be readily demonstrated to a large audience by employing liquids which burn with different flames, for example, formic acid and ethyl benzoate. The flame is first a clear blue, then gradually assumes a yellow tinge, and finally becomes perfectly luminous.

J. J. S.

System of Indexing Chemical Literature; Adopted by the Classification Division of the U.S. Patent Office. By EDWIN A. HILL (*J. Amer. Chem. Soc.*, 1900, 22, 478—494).—A discussion of a system of indexing based upon the empirical formulæ of the chemical substances.

E. G.

Inorganic Chemistry.

Some Properties of Liquid Chlorine. By A. LANGE (*Zeit. angew. Chem.*, 1900, 683—686).—The specific gravity of liquid chlorine has been determined for temperatures between -50° and $+100^{\circ}$ by the method previously employed in the case of liquid ammonia and sulphur dioxide (see Abstr., 1899, ii, 478). The results obtained agree well with those of Knietzsch (Abstr., 1891, 14). The coefficient of expansion of liquid chlorine increases slowly but regularly, and at 90° is as great as the coefficient of gaseous expansion. The coefficient of compressibility increases from 0.000225 at 37° to 0.000637 at 93° . Liquid chlorine does not attack the iron of the containing vessel, except above 90° . The author discusses also the conditions for the safe transport of liquid chlorine. J. C. P.

Extraction of Oxygen from Air by Dissolution at a Low Temperature. By GEORGES CLAUDE (*Compt. rend.*, 1900, 131, 447—450).—The author has examined the solubility of oxygen and nitrogen at low temperatures in alcohols, ethers, acetone, chloroform, petroleum, benzene, and various inorganic liquids with a view to obtain partial separation of the oxygen and nitrogen of the air. At low temperatures, the solubility of the nitrogen increases at the same rate as that of the oxygen, and hence the method seems to be of no value for practical purposes. C. H. B.

Composition of the Air at Various Altitudes. By GUSTAVUS HINRICHS (*Compt. rend.*, 1900, 131, 442—443).—Assuming that each of the components of the atmosphere forms an atmosphere independent of the other gases, and that the pressure p of each of them at the altitude H in myriametres is given by Laplace's formula, $\log. P/p = H/K$, and that for a gas of density D the constant K has the value $1.8400/D$, and further, that there is no reciprocal action, the percentage composition of the air by volume at various altitudes will be as follows:

Altitude in myriametres.	Carbon dioxide.	Oxygen.	Argon.	Nitrogen.	Hydrogen.
0	0.3	21.00	1.20	77.75	0.02
1	0.2	18.43	0.75	80.74	0.06
2	0.1	16.07	0.46	83.26	0.20
3	0.00	13.90	0.28	85.18	0.64
4	—	11.86	0.16	85.94	2.04
5	—	9.83	0.12	83.94	6.11
6	—	7.52	0.00	75.54	16.94
7	—	4.7	—	56.2	39.10
8	—	2.2	—	31.0	66.8
9	—	0.7	—	12.9	86.4
10	—	0.3	—	4.6	95.1

It is noteworthy that the proportion of nitrogen passes through a maximum at an altitude of 4 myriametres, whilst at an altitude of 10 myriametres the atmosphere will be almost pure hydrogen.

C. H. B.

Action of Iodides and Hydriodic Acid on Sulphur Dioxide. By JAKOB VOLHARD (*Bull. Soc. Chim.*, 1900, [iii], 23, 673—674).—Referring to the recent experiments of Berg (this vol., ii, 535), it is pointed out that the action of hydriodic acid on sulphur dioxide was studied by the author in 1887 (*Abstr.*, 1889, 192). The existence of an unstable compound of hydrogen iodide and sulphur dioxide, as suggested by Berg, is considered to be improbable, and the decomposition is attributed to the simultaneous occurrence of two reactions, namely, the oxidation of the hydrogen iodide by the sulphur dioxide with the formation of iodine and sulphur, and the oxidation of the sulphur dioxide by the iodine with the further deposition of sulphur and regeneration of hydrogen iodide. N. L.

Relationship between Reactivity and Concentration of Sulphuric Acid. By WILHELM VAUBEL (*J. pr. Chem.*, 1900, [ii], 62, 141—144).—A number of the reactions of sulphuric acid depend on the hydrates that are present in the solution, rather than on the degree of electrolytic dissociation. Amongst these are the green coloration with phenylrosinduline at concentrations below 95.2 per cent., the formation of hydrogen sulphide from sodium thiosulphate at concentrations above 84.1 per cent., and the series of colours produced at different concentrations in safranin solutions. T. M. L.

Allotropic Forms of Selenium. By A. P. SAUNDERS (*J. Physical Chem.*, 1900, 4, 423—513).—Besides the author's own investigations, the paper contains an extensive *résumé* of all previous work on selenium, its physical properties and behaviour. The author considers that there are only three modifications of selenium, namely, (1) the liquid, including what are known as the vitreous, amorphous, and soluble varieties; (2) the red crystalline, and (3) the black crystalline or metallic modification. Of these, the metallic form is the most stable, the red crystalline being intermediate between the other two, with probably its potential curve cutting that of the liquid variety below the point of intersection of the other two curves, that is, below 217°, the melting point of metallic selenium. Although this view explains most of the previous observations, a few are still inexplicable. The vitreous form changes to the metallic form on heating, the velocity rapidly increasing above 60°, but there is no transition point, the metallic variety being stable at all temperatures. In no case does a change to the red crystalline form take place, except in the presence of certain solvents. Although the vitreous and amorphous varieties are regarded as identical, there are slight differences in properties which must be ascribed to differences of aggregation. In the presence of various organic liquids, amorphous selenium is converted more or less speedily into one of the other forms, and the action of a large number of liquids was studied. It is noticeable that those causing change to the metallic form are generally nitrogenous compounds, especially ring compounds, with nuclear nitrogen. The red crystals have an unstable melting point below 217°. The values for the heat of transformation obtained by various observers differ greatly; it is, however, certainly sufficient to raise the mass to the melting point, and probably considerably greater than this. Specific heat and density observations are collected, and the

author's results added. The most probable density values are ; amorphous 4.26, vitreous 4.28, red crystals 4.47, metallic 4.80. The action of light on the conductivity is discussed, and the values for the various physical constants are collected.

L. M. J.

Electrolysis of Azoimide. By ALBERTO PERATONER and GIUSEPPE ODDO (*Gazzetta*, 1900, 30, ii, 95—96).—Referring to Szarvasy's work (*Trans.*, 1900, 77, 606) on this subject, the authors call attention to the paper published by them in 1895 (*Abstr.*, 1896, ii, 245), in which they show that the deviation of the ratio of the volumes of nitrogen and hydrogen from the theoretical value is due to secondary reactions occurring during the electrolysis.

T. H. P.

Production of Nitric Acid from Air by Means of the Electric Flame. By ARTHUR McDUGALL and FRED HOWLES (*Mem. Manchester Lit. and Phil. Soc.*, 1900, 44, Pt. iv, No. 13, 1—19).—The amount of nitric acid produced by means of the electric flame depends very largely on the form of the combustion chamber ; when using about 225 watts, a large horizontal stoneware pipe gave only 98 grams per 12 H.P.-hours, whilst a vertical stoneware bottle gave 180 grams, and a second vertical chamber of conical shape gave 270 grams. The yield is greatest when the current is only just sufficient to keep the flame steady, and rose from 270 to 300 grams per 12 H.P.-hours when 172 watts were used instead of 225, but fell to 180 grams when 302 watts were used. By using instead of air a mixture of 2 vols. oxygen to 1 vol. nitrogen, the yield was raised to 590 grams, whereas Lord Rayleigh obtained 440 grams in his apparatus. The yield is decreased when the air supply is heated, and, owing to the excessive heating, is very small when a low-tension discharge between carbon poles is used.

T. M. L.

[Alleged] Conversion of Phosphorus into Arsenic and into Antimony. By FRIEDRICH FITTICA (*Chem. Zeit.*, 1900, 24, 561—562).—A reply to Winkler (this vol., ii, 476). The author considers that Winkler's failures in obtaining even minute traces of arsenic are due to the fact that the directions previously given were not accurately followed. He further states that antimony is a nitrogen derivative of phosphorus, and may be obtained in small quantities, together with arsenic, by heating amorphous phosphorus with ammonium nitrate and potassium nitrite, with or without the addition of ammonium carbonate.

J. J. S.

Metaphosphates. By GEORG VON KNORRE (*Zeit. anorg. Chem.*, 1900, 24, 369—401).—The author has reinvestigated the metaphosphates, and gives an account of the work done by other authors. Sodium trimetaphosphate, when prepared according to the methods of Fleitmann and Henneburg (*Annalen*, 1848, 65, 304, and *Ann. Phys. Chem.*, 1849, 78, 233, 238, 361), or of Lindboom (*Ber.*, 1875, 8, 122), contain small quantities of sodium hydrogen pyrophosphate and hexametaphosphate, which cannot be eliminated by fractional crystallisation. A pure salt, however, can be prepared by treating the solution with excess of a solution of lead nitrate, whereby the lead salts of the admixed phosphates are precipitated, and the pure lead trimetaphos-

phate is then decomposed with sodium sulphate. Sodium trimetaphosphate is also easily obtained in a pure state by heating sodium orthophosphate with ammonium nitrate for 6 hours at 300°. The electrical conductivity of the solutions of the salt is in accordance with the presence of a tribasic acid.

When sodium ammonium phosphate is heated, the following products are obtained: at 200°, sodium hydrogen pyrophosphate; at 280°, insoluble metaphosphate, soluble metaphosphate, and pyrophosphate; at 310°, insoluble sodium metaphosphate, together with some trimetaphosphate and pyrophosphate. Sodium dihydrogen phosphate, when heated at 210° to 240°, is converted into pyrophosphate; at 280°, it is converted into insoluble metaphosphate, pyrophosphate, and trimetaphosphate. Diammonium hydrogen phosphate yields the following salts: when heated at 155°, ammonium dihydrogen phosphate; at 166°, pyrophosphate begins to be formed; at 216°, 280°, and 360°, mixtures of phosphate, trimetaphosphate, and pyrophosphate are obtained, but an insoluble ammonium metaphosphate is not formed.

Insoluble sodium metaphosphate is obtained in almost theoretical quantities by evaporating a solution of sodium nitrate with not more than 10 per cent. excess of phosphoric acid, and then heating the residue at 330°. The three modifications of insoluble sodium metaphosphate described by Tammann (Abstr., 1892, 1050) are, according to the author, identical.

E. C. R.

Action of Hydrogen on the Sulphides of Arsenic. By H. PÉLABON (*Compt. rend.*, 1900, 131, 416—419).—The interaction of realgar with hydrogen at temperatures above 300° is reversible, $2\text{H}_2 + \text{As}_2\text{S}_3 \rightleftharpoons 2\text{H}_2\text{S} + \text{As}_2$. Experiments at 610°, in tubes containing 0.5 gram of realgar and about 8 c.c. of hydrogen measured under atmospheric pressure, show a limit of the action, when R , the ratio of the partial pressure of hydrogen sulphide to the total pressure in the tube on cooling, has a value 93.07. If more than 0.3 gram of realgar is used (that is, so that some remains unvolatilised at 610°), increasing the amount of arsenic gradually diminishes the value of R until a constant value 78.69 is reached. The action of hydrogen sulphide on arsenic at 610° has a limit characterised by $R = 64.90$. All these results are shown to be in accord with the theory of dissociation.

W. A. D.

Permeability of Molten Silica to Hydrogen. By P. VILLARD (*Compt. rend.*, 1900, 130, 1752—1753).—If a tube of silica attached to a manometer is exhausted and then heated by a Bunsen flame, the pressure inside rises, and it was shown that this is due to the passage of hydrogen through the walls of the tube. The permeability increases considerably when the temperature is raised sufficiently to soften the silica.

L. M. J.

Double Thiosulphates and Sulphites of the Alkali Metals, Silver, and Copper. By ARTHUR ROSENHEIM and SIEGFRIED STEINHÄUSER (*Zeit. anorg. Chem.*, 1900, 25, 72—103).—A large number of the numerous double compounds of the alkali thiosulphates and sulphites with silver and cuprous thiosulphates and sulphites respec-

tively, which have been described, are evidently mixtures, and of those which may be considered as chemical compounds it is not possible to determine if they are double salts or complex compounds, since most of them are very sparingly soluble and are readily decomposed in solution. The potassium and ammonium compounds have the simpler composition, and are probably double salts; the sodium compounds are mostly of a very complicated composition, and the authors consider these to be examples of the solid-solution of cuprous and silver thiosulphates and sulphites. The following are described :

Potassium compounds :

Ammonium compounds :

Sodium compounds :

E. C. R.

Double Salts of Ammonium Thiosulphate with Silver and Copper Haloids. By ARTHUR ROSENHEIM and SIEGFRIED STEINHAÜSER (*Zeit. anorg. Chem.*, 1900, 25, 103—111).—Silver chloride, when dissolved in sodium or potassium thiosulphate, undergoes double decomposition with the formation of double compounds of silver thiosulphate and alkali thiosulphate; it dissolves, however, in ammonium thiosulphate with the formation of compounds containing chlorine.

The *salt*, $\text{AgCl}, \text{NH}_4\text{Cl}, 4(\text{NH}_4)_2\text{S}_2\text{O}_3$, obtained by saturating a solution of ammonium thiosulphate with silver chloride and concentrating in a vacuum over sulphuric acid, crystallises in lustrous, quadratic crystals [$a : c = 1 : 0.635596$], is extremely stable, can be dissolved without decomposition in cold water or ammonia, yields a small quantity of silver sulphide when boiled with water, is decomposed by dilute acids into silver chloride, silver sulphide, sulphur, hydrogen sulphide, and sulphur dioxide, and by alkaline hydroxides with formation of silver oxide and evolution of ammonia. The corresponding *bromine* compound, $\text{AgBr}, \text{NH}_4\text{Br}, 4(\text{NH}_4)_2\text{S}_2\text{O}_3$, is isomorphous with the preceding [$a : c = 1 : 0.62948$]. The corresponding *iodine* and the *thiocyanogen* compounds are also described. With silver cyanide and ammonium thiosulphate, beautiful, lustrous crystals are obtained, of which, however, the various preparations differ considerably in composition, although they are identical in appearance.

Cuprous chloride yields a similar compound to silver chloride. The *chlorine* compound, $\text{CuCl} \cdot \text{NH}_4\text{Cl} \cdot 4(\text{NH}_4)_2\text{S}_2\text{O}_8$ [$\alpha : c = 1 : 0.631327$], and the *bromine* compound [$\alpha : c = 1 : 0.63828$] are isomorphous with the corresponding silver compounds. The *iodine* and *thiocyanogen* compounds, and the crystals obtained from copper cyanide are similar to the silver compounds.

Apparently, only the haloid salts of the members of the first group of the periodic system are capable of forming these complex compounds, which are similar to the double salts of potassium iodide and ethyl sulphonates of the formula $\text{R}'\text{I} \cdot 4\text{EtSO}_3\text{R}'$. E. C. R.

Composition of Bottle Glasses. By KARL ZULKOWSKI (*Chem. Zeit.*, 1900, 24, 439—440).—A reply to the criticisms of Dralle (this vol., ii, 482) on the author's previous communications (*Chem. Ind.*, 1899, 22, 280; and 1900, 23, 108). E. G.

Atomic Weight of Radio-active Barium. By SKŁODOWSKA CURIE (*Compt. rend.*, 1900, 131, 382—384).—By fractionally crystallising radio-active barium chloride (this vol., ii, 81—83, 126, 254), the authoress has isolated about 2 centigrams of a substance free from barium, which she considers to be nearly pure radium chloride. Insufficient substance was obtained to determine the atomic weight of the metal, but a sample of radio-active barium chloride, which appeared from its spectrum to contain rather more radium than barium (Demarçay), gave a value 173.9 for the atomic weight of radio-active barium; the atomic weight of radium is thus much greater than 174.

It is noteworthy that radio-active barium chloride rich in radium, after being kept several days, especially in a moist atmosphere, changes in colour and appearance and evolves an odour resembling that of potassium hypochlorite; simultaneously, the radio-activity increases. W. A. D.

Boiling Points of Zinc and Cadmium. By DANIEL BERTHELOT (*Compt. rend.*, 1900, 131, 380—382).—The boiling points were determined in an atmosphere of nitrogen by means of a thermoelectric couple of platinum and platinum-iridium, special care being taken to prevent loss of heat by cooling. Carefully purified zinc boils at 920° under 760 mm. pressure; the relationship of this result to that of other observers is discussed. Pure cadmium boils at 778° under normal pressure; the values of other observers are far from concordant, Becquerel giving 746° , Carnelley 763 — 772° , and Deville and Troost 815° . W. A. D.

Trihydrated Acid Cadmium Iodide. By D. DOBROSERDOFF (*J. Russ. Phys. Chem. Soc.*, 1900, 32, 297—300).—On passing hydrogen iodide into a pasty mass of powdered cadmium iodide mixed with a saturated solution of the salt, a large quantity of the gas is absorbed, and when all the solid is dissolved and absorption of hydrogen iodide ceases, there remains a dark brown, almost black, liquid which fumes strongly in the air and has a sp. gr. about 3. At -4.7° , this liquid

slowly solidifies to a mass of almost colourless needles of the composition $\text{CdI}_2 \cdot \text{HI} \cdot 3\text{H}_2\text{O}$, which are decomposed in the air into hydrogen iodide and cadmium iodides, but are stable in presence of the mother liquor or in an atmosphere of hydrogen iodide. T. H. P.

Trivalent Thallium. By RICHARD JOS. MEYER (*Zeit. anorg. Chem.*, 1900, 24, 321—368).—Thallium trichloride, obtained by treating the chloride suspended in water with chlorine, crystallises with $4\text{H}_2\text{O}$ when the syrupy solution is cooled in a freezing mixture. The *tetrahydrate* is very hygroscopic, melts at 45° , and solidifies at 33° . The *monohydrate* is obtained by heating the tetrahydrate at 55° , or by crystallisation from solution at the ordinary temperature. It crystallises in lustrous, six-sided tablets, reacts acid to litmus, and when heated at 100° is decomposed with evolution of chlorine. The *hydrochloride*, $\text{TlCl}_3 \cdot \text{HCl} \cdot 3\text{H}_2\text{O}$, crystallises in slender needles, is very hygroscopic, decomposes when heated, and when neutralised with potassium hydroxide yields the salt $\text{TlCl}_3 \cdot 2\text{KCl}$. Thallium trichloride yields with ether and ethyl alcohol the crystalline salts $\text{TlCl}_3 \cdot \text{Et}_2\text{O}$ and $\text{TlCl}_3 \cdot \text{EtOH}$. The anhydrous trichloride is obtained by extracting the ether from the preceding ether compound by means of a vacuum; it crystallises in six-sided plates and melts at 24° . Thallium trichloride yields the double salts $\text{TlCl}_3 \cdot 2\text{KCl} \cdot 2\text{H}_2\text{O}$, $\text{TlCl}_3 \cdot 3\text{KCl} \cdot 2\text{H}_2\text{O}$, $\text{TlCl}_3 \cdot 3\text{NH}_4\text{Cl}$, and the tribromide yields $\text{TlBr}_3 \cdot \text{KBr} \cdot 2\text{H}_2\text{O}$. These salts can be dehydrated until the sum of the water molecules and negative radicles combined with the thallium is reduced to six; any further dehydration then results in decomposition. Only two-thirds of the chlorine is precipitated when a cold aqueous solution of thallium trichloride is treated with silver nitrate.

Compounds of Thallium Trichloride with Organic Bases.—[With C. WIEGAND.]—*Thallium chloride tripyridine*, $\text{TlCl}_3 \cdot 3\text{C}_5\text{NH}_5$, crystallises in white needles and is the most stable of the thallium trichloride compounds towards water. The compound $\text{TlCl}_3 \cdot \text{C}_5\text{NH}_5 \cdot \text{HCl}$ crystallises in white leaflets, the compound $\text{TlCl}_3 \cdot 3\text{C}_5\text{NH}_5 \cdot 3\text{HCl}$ in large, lustrous prisms. The *trianiline chloride*, $\text{TlCl}_3 \cdot 3\text{NH}_2\text{Ph} \cdot 3\text{HCl}$, crystallises in yellow leaflets; the *triethylamine chloride*, $\text{TlCl}_3 \cdot 3\text{EtNH}_2 \cdot 3\text{HCl}$, crystallises in hexagonal prisms and melts at 178° ; the *diethylamine chloride*, $\text{TlCl}_3 \cdot 2\text{Et}_2\text{NH} \cdot 2\text{HCl}$, melts at 112° .

Thallium tribromide, $\text{TlBr}_3 \cdot \text{H}_2\text{O}$, obtained by shaking thallium bromide with bromine water and evaporating in a vacuum with repeated additions of bromine in order to prevent reduction, crystallises in slender needles and is very unstable. The salt $\text{TlBr}_3 \cdot \text{TlBr}$, obtained by evaporating a solution of the tribromide in a vacuum as long as bromine is evolved, crystallises in red leaflets and is decomposed when treated with water. The following *chlorobromides* are described: $\text{TlCl}_3 \cdot 2\text{TlBr} \cdot \text{TlCl}$, $\text{TlBr}_3 \cdot 2\text{TlCl} \cdot \text{TlBr}$, $(\text{TlCl}_3 \cdot \text{TlCl}) \cdot 2(\text{TlBr}_3 \cdot \text{TlBr})$, and $2(\text{TlCl}_3 \cdot \text{TlCl}) \cdot (\text{TlBr}_3 \cdot \text{TlBr})$.

Thallium trinitrate, $\text{Tl}(\text{NO}_3)_3 \cdot 3\text{H}_2\text{O}$, obtained by dissolving the oxide in nitric acid, crystallises in white, lustrous crystals, effloresces on exposure to the air with evolution of nitric acid, and is a strong oxidising agent. The salt, $\text{Tl}(\text{NO}_3)_3 \cdot 2\text{KNO}_3 \cdot \text{H}_2\text{O}$, separates in large, transparent crystals. E. C. R.

Amalgams. By WILHELM KERP and WILHELM BÖTTGER (*Zeit. anorg. Chem.*, 1900, 25, 1—71. Compare Abstr., 1898, ii, 516).—I. [With H. WINTER.]—The following crystalline amalgams have been prepared and analysed, and the temperatures determined at which they are stable when dissolved in mercury. *Sodium amalgam*, at 0° to 40·5° NaHg₆, and at 40·5° to 150° NaHg₅, are obtained from solutions of sodium in mercury. *Lithium amalgam*, LiHg₅, is obtained at all temperatures up to 100°. *Potassium amalgams*, at 0° KHg₁₄, up to 71—73° KHg₁₂, at 73° to 75° KHg₁₀, is obtained, and above 75° the solid amalgam gradually alters in composition with the rise in temperature. *Rubidium amalgams*, below 0° RbHg₁₂ is stable, and above 0° the composition of the solid amalgam varies with the rise in temperature.

II. [With H. IGGENA.]—*Strontium amalgam*, below 30° SrHg₁₂ is stable, and at higher temperatures the composition varies. *Barium amalgams*, below 30° BaHg₁₃, at 30° to 100° BaHg₁₂, are obtained.

III. Definite zinc amalgams were not obtained. *Cadmium amalgam*, Cd₂Hg₇, is obtained at 0° to 44°, and above this temperature indefinite compounds.

These crystalline amalgams have properties corresponding with true chemical compounds; the composition is the same when they are prepared from supersaturated or from non-saturated solutions; they can be recrystallised from mercury without decomposition provided the temperature at which they are decomposed is not exceeded, and they possess properties which differ from those of the alkali or alkaline earth metal from which they are formed, especially in their relative high stability to the action of air and water. The amalgam NaHg₆, when treated with potassium hydroxide at the ordinary temperature, is converted into the amalgam KHg₁₂.

The authors compare these results with those obtained by Maey (Abstr., 1899, ii, 547) and Kurnakoff (this vol., ii, 277). [Compare also Guntz and Ferée, this vol., ii, 540.]

E. C. R.

New Spectra of the Rare Earths. By EUGÈNE A. DEMARÇAY (*Compt. rend.*, 1900, 131, 387—389).—The following lines were observed in the spark spectrum of the brown oxide obtained from the most soluble portions of moderately pure (déjà assez pur) gadolinium magnesium nitrate: $\lambda = 3704\cdot3, 3703\cdot2, 3676\cdot7, 3568\cdot4, 3561\cdot7, 3540\cdot2, 3523\cdot4, 3508\cdot5$. These lines possibly belong to terbium, but since the purity of the material used was indeterminate, they are attributed provisionally to an element denoted by P. In some less coloured oxides, the following lines were observed, possibly belonging to the earth Zy of Lecoq de Boisbaudran: 4212·6, 4195·5, 4187·3, 3978·6, 3945·0, 3595·0, 3550·0, 3531·3. The element producing these lines is denoted by Δ.

In some yttrium, containing fractions intermediate in solubility between holmium and erbium, two intense lines, 3967·9 and 3930·9 were recorded, belonging to the hypothetical element "Ω." In the spectra of the slightly basic earths, intermediate between erbium and ytterbium, the two lines 4008·2 and 3906·5 are very intense; these are attributed to an element "Θ."

W. A. D.

Hydrates of Manganous Iodide. By P. KUZNETZOFF (*J. Russ. Phys. Chem. Soc.*, 1900, 32, 290—297. Compare Abstr., 1899, ii, 658).—On cooling a solution of manganous iodide saturated at 0°, the tetrahydrated salt first separates out, and at -5° colourless, prismatic columns of the hexahydrate are obtained; they are very deliquescent, and at -2.7° decompose into the tetrahydrate and a saturated solution of the salt. When a solution containing 63.18 per cent. of the anhydrous salt is cooled to -40° or -45°, crystals are separated, and on adding some of these to the mother liquor at a temperature of -20.5°, there is slowly deposited stout, colourless plates of the nonhydrated salt having the melting point -9.3°.

T. H. P.

Osmond and Roberts-Austen's Theory of Iron-carbon Alloys. By E. HEYN (*Chem. Centr.*, 1900, ii, 163—164; from *Stahl und Eisen*, 20, 625—636).—The paper contains a description of Roberts-Austen's methods and results.

The fact that when the iron-carbon alloy is rapidly cooled there is no separation of graphite may possibly be explained by assuming another line of solidification for the separation of a mixture of a solid solution of 1.2 per cent. carbon in iron (Fe_γ) with cementite. Such a hypothesis accords well with the want of flexibility of white irons whose sections show veins of cementite containing small particles of perlite and embedded in a matrix of perlite. As the iron-carbon alloys are allowed to cool after solidifying, the curves show several well marked breaks in continuity corresponding on the one hand with the separation of ferrite from the solution of 1.2 per cent. carbon in iron (Fe_γ) and on the other with the separation of carbide (cementite) and of a eutectic mixture of ferrite and cementite. These breaks are best explained by assuming the existence of three allotropic modifications of iron. The α -form exists at the ordinary temperature, whilst the γ -form is completely converted into the β -form at about 900° in the case of iron almost free from carbon. The position of these points in the curve is, however, considerably affected by a larger amount of carbon. For instance, in the case of alloys containing 0.8 per cent. of carbon, the solid solution of carbon in γ -iron (martensite) separates into α -iron (ferrite) and cementite thus forming perlite. Alloys with less than 0.35 per cent. of carbon show three breaks in the curve, the first corresponding with a separation of β -iron from the solid solution of carbide in γ -iron, the second with the conversion of β -iron into α -iron, and the third with the decomposition of the residual solid solution of carbon or carbide in γ -iron into its components, α -iron (ferrite) and cementite. The internal structure of the crystals often found in the cavities also corresponds with these secondary changes, for their section shows a mixture of ferrite and perlite formed from the solid solution of carbon in iron.

Oxidation of Salts of Cobalt and of Cerium in Alkaline Solution. By ANDRÉ JOB (*Ann. Chim. Phys.*, 1900, [vii], 20, 205—264).—A detailed account of work already published (Abstr., 1899, ii, 51, 61, 291, 334, 486).

W. A. D.

Supposed Decomposition of Nickel Sulphate by Light. By D. DOBROSERDOFF (*J. Russ. Phys. Chem. Soc.*, 1900, 32, 300—301).—The generally accepted statement that ordinary heptahydrated nickel sulphate is decomposed by the action of light is shown by the author to be erroneous. If the crystals occupy only a small portion of the containing vessel, they lose water with the formation of the hexahydrate, whether they are exposed to light or not. On the other hand, they are not changed, even by strong light, if the surrounding air is saturated with water vapour or if the crystals are in contact with filter paper moistened with turpentine, or if they completely fill the vessel containing them. T. H. P.

The Blue Oxide of Molybdenum. By MARCEL GUICHARD (*Compt. rend.*, 1900, 131, 389—392 and 419—421. Compare this vol., ii, 597).—The blue oxide of molybdenum, when hydrated, has the composition $\text{MoO}_3 \cdot 4\text{MoO}_3 \cdot 6\text{H}_2\text{O}$, and is thus a molybdenum dimolybdate, as considered by Berzelius. It is best obtained by mixing cold, dilute hydrochloric acid solutions of molybdenum dioxide and ammonium molybdate; the hydrochloric acid should be that of sp. gr. 1.18 diluted with 9 parts of water, this bringing about complete precipitation without decomposition. Stronger acid decomposes the oxide. The product thus obtained is nearly insoluble in cold water, although that prepared by Rammelsberg's method, by precipitation at 50° , is easily soluble; an aqueous solution of the oxide is readily obtained by leaving molybdenum trioxide and metallic molybdenum in contact in water.

The oxide obtained by precipitation is a dark blue powder of sp. gr. 3.6 at 18° ; by the evaporation of its solution, it is obtained in vitreous, faceted fragments, which yet are not truly crystalline. It dissolves in water at 50° , but is insoluble in saturated solutions of ammonium, sodium and calcium chlorides, and potassium iodide and nitrate; sodium and magnesium sulphate do not alter its solubility. It dissolves in alcohol of 95° , although insoluble in most organic solvents. When heated in a vacuum or an inert gas, it loses part of its water at 100° , and the rest near a red heat, a non-homogeneous mixture of molybdenum dioxide and trioxide being formed. Hydrogen reduces it ultimately to the metal; chlorine yields the volatile oxychloride, MoO_2Cl_2 , and molybdenum trioxide. Contrary to Berzelius' statement, it slowly oxidises in the air, and at a red heat oxygen rapidly converts it into the trioxide. Gaseous hydrogen chloride at a red heat and superheated steam decompose it, giving mixed dioxide and trioxide; gaseous ammonia gives initially the same result, but at a red heat reduces the oxides to the metal. Acetic acid does not affect it; by concentrated hydrochloric acid, it is dissolved to a yellowish-red solution of molybdenum tetrachloride, but the action is a reversible one, since, on diluting with water, the blue oxide is precipitated. With sulphuric acid, a like result is obtained. W. A. D.

Fluoro-hyperuranium Compounds. By S. LORDEKIPANIDZÉ (*J. Russ. Phys. Chem. Soc.*, 1900, 32, 283—287).—By the interaction of equivalent proportions of sodium fluoride and uranium oxyfluoride, UO_2F_2 , the double compound, $\text{UO}_2\text{F}_2 \cdot \text{NaF}$, is obtained, which, when dissolved in water, gives with hydrogen peroxide an intensely yellow

solution; on evaporating the latter on a water-bath at 60—70°, a yellow, granular *precipitate* is thrown down, giving on analysis the composition $\text{UO}_2\text{NaF}_5\text{H}_2\text{O}$. Four mols. of water are lost at 100°.

The addition of excess of hydrogen peroxide to an aqueous solution of the double salt, $\text{UO}_2\text{F}_2 \cdot 3\text{KF}$, gives an intensely yellow liquid which after some time deposits a yellow, pulverulent *double compound*, $\text{K}_4\text{U}_4\text{F}_{16} \cdot 4\text{H}_2\text{O}$ or $3(\text{UO}_2\text{KF}) \cdot \text{UO}_3\text{F}_2 \cdot \text{KF} \cdot 4\text{H}_2\text{O}$. T. H. P. 21

Cause of the Loss in Weight of Commercial Platinum when heated under some Conditions. By ROBERT W. HALL (*J. Amer. Chem. Soc.*, 1900, 22, 494—501).—A series of experiments is described in which platinum wires enclosed in glass tubes were heated strongly by means of an electric current, various gases being passed through the tubes; it was found that the loss of weight of platinum in carbon monoxide or dioxide is zero or very little, that in hydrogen there is a very slight gain, whilst in air or oxygen the loss is rapid. Berliner (*Ann. Phys. Chem.*, 1888, [ii], 33, 287) found that when platinum which has been exposed to air is heated in a vacuum, gas is evolved and platinum deposited on the glass cylinder surrounding the metal; he also made the observation, which the present author is unable to confirm, that the behaviour of platinum in hydrogen is exactly the same, and therefore concluded that the action is purely mechanical and caused by the escaping gases. When the platinum wire is heated in air or oxygen, there is always produced on the glass tube a lustrous metallic deposit, which, as observed by Nahrwold (*Ann. Phys. Chem.*, 1887, [ii], 31, 467), is only partially soluble in aqua regia.

From the results of these experiments, it seemed probable that an oxidising gas-flame would cause a greater loss of platinum than a reducing one, and this was proved to be the case by observing the loss of weight of a platinum crucible when heated in different parts of the blow-pipe flame.

The author considers that the behaviour of platinum when heated is best explained by the hypothesis that a volatile oxide is formed, stable at high and low temperatures, but unstable at intermediate temperatures, like the platinous chloride of Troost and Hautefeuille (Abstr., 1877, ii, 273). E. G.

Platinum Compounds of Hydroxylamine. By RUDOLF UHLENHUTH (*Annalen*, 1900, 312, 235—236. Compare this vol., ii, 485).—An explanatory note relative to a claim for priority by Lossen and Alexander. M. O. F.

Ruthenium and its Compounds. III. By UBALDO ANTONY and ADOLFO LUCCHESI (*Gazzetta*, 1900, 30, ii, 71—76. Compare Abstr., 1899, ii, 299).—During the conversion of ruthenium sulphate into ruthenious dithionate (*loc. cit.*) by the action of sulphur dioxide, the colour of the solution changes from bright red through green and violet to azure, after which the liquid is gradually decolorised. On pouring the azure solution into alcohol, a precipitate of the same colour, consisting of *ruthenic sulphite*, $\text{Ru}_2(\text{SO}_3)_3$, is obtained. This compound, which is an intermediate product in the above conversion, is a colloidal substance and dissolves in a large quantity of water,

giving a solution from which it is completely precipitated by the addition of a salt. It can be dried at 80° without change, but when heated in a current of carbon dioxide or nitrogen, it begins to lose sulphur dioxide at 100° , and on stronger heating is completely decomposed, with formation of a brown substance. T. H. P.

Osmium. By ARTHUR ROSENHEIM (*Zeit. anorg. Chem.*, 1900, **24**, 420—424. Compare Abstr., 1899, ii, 664).—Sodium osmichloride, when boiled with concentrated sodium hydrogen sulphite, is converted into the osmisulphite, $[\text{Os}(\text{SO}_3)_6]\text{Na}_8 \cdot 8\text{H}_2\text{O}$. By the prolonged action of excess of sodium hydrogen sulphite at the ordinary temperature, the *chlorosmisulphite*, $\text{OsCl}_2(\text{SO}_3)_4\text{Na}_6 \cdot 10\text{H}_2\text{O}$, is obtained. The same salt is obtained by the action of sodium sulphite on sodium osmichloride at the ordinary temperature.

Potassium hydrogen chlorosmisulphite, $\text{OsCl}_4(\text{SO}_3)_4\text{K}_6\text{H}_2$, obtained by the prolonged action of potassium hydrogen sulphite on potassium osmichloride, crystallises in dark red, monoclinic prisms [$a:b:c = 1.7243:1:1.1729$; $\beta = 105^{\circ}44'$]. When heated with hydrochloric acid, it evolves sulphur dioxide and is converted into potassium osmichloride. E. C. R.

Mineralogical Chemistry.

Anthracite and Anthraxolite from Canada. By W. HODGSON ELLIS and WILLIAM LAWSON (*Proc. Canadian Inst.*, 1898, N.S., 1, 67—68).—A coal-like substance (anthracite) occurring as a vein in Cambrian rocks at Sudbury gave anal. I, sp. gr. 1.865. It resembles a substance (anal. II), called anthraxolite, from near Kingston.

	C.	H.	N.	S.	Ash.	O.	Total.
I.	94.92	0.52	1.04	0.31	1.52	[1.69]	100.00
II.	90.25	4.16	0.52	0.66	0.72	[3.69]	100.00

A proximate analysis of the first of these gave: moisture, 4.00; volatile matter, 1.80; fixed carbon, 90.10; ash, 4.10. L. J. S.

Salt from Lake Djouvan-Tubé. By WLADIMIR B. MARKOWNIKOFF (*J. Russ. Phys. Chem. Soc.*, 1900, **32**, 307—309).—[With K. BAILINSK.]—The salt deposited on the shores of Lake Djouvan-Tubé in the Akmolinsk Province, has the following composition: H_2O (of crystallisation and hygroscopic), 24.30; insoluble residue, 1.90; Cl, 12.39; SO_3 , 33.23; MgO , 5.31; Al_2O_3 , 3.97; FeO , 0.97; CaO , 1.40; Na (by difference), 14.33. T. H. P.

Von-Diestite, a new Mineral. By E. CUMENGE (*Bull. Soc. franç. Min.*, 1899, **22**, 25—26).—This occurs with ores of copper and auriferous pyrites in the Hamilton and Little Gerald Mines on the Sierra Blanca, Colorado. Analysis by F. C. Knight gave:

Ag.	Bi.	Te.	Au.	Pb.	S.	Insol.	Total.
40.25	16.31	34.60	4.30	2.25	0.54	0.54	98.79

L. J. S.

Colours of Minerals. By ARNOLD NABL (*Tsch. Min. Mitth.*, 1900, 19, 273—276).—The author has suggested that the colour of amethyst may be due to ferric thiocyanate (Abstr., 1899, ii, 561), but L. Wöhler and K. von Kraatz-Koschlaw (*Tsch. Min. Mitth.*, 1899, 18, 449) have failed to detect the presence of sulphur. The author has repeated his experiments, and finds distinct indications of sulphur. Also by heating amethyst at 180° he obtained 0.025 per cent. of nitrogen.

L. J. S.

Analyses of Corundum and Corundum-bearing Rock. By WILLIAM L. GOODWIN (*Rept. Bureau Mines, Toronto*, 1898, 7, 238—239. Compare this vol., ii, 552).—Crystals of corundum from Eastern Ontario gave the following results on analysis. Silica is also present (0.05—0.09 per cent.), and sometimes small quantities of cerium earths.

Al ₂ O ₃ .	Fe ₂ O ₃ .	Insol.	Loss on ignition.
96.92	—	1.36	2.43
96.26	0.36	—	1.93
97.23	0.32	—	—

Analyses are also given of the corundum-bearing rock.

L. J. S.

Phosphorescent Dolomite from Elba. By GIOVANNI D'ACHIARDI (*Jahrb. Min.*, 1900, ii, Ref. 14; from *Proc. Verb. Soc. Toscana Sci. Nat.*, 1899, 11, 156—157).—This occurs as a band in crystalline limestone at Valdana near Portolongone and at Capo Calamita. It is pale yellowish with black spots of foreign material, and is very fine grained and friable; when rubbed, it is strongly phosphorescent. Analyses gave:

CaO.	MgO.	Mn ₂ O ₄ + Fe ₂ O ₃ .	Loss on ignition (H ₂ O + CO ₂).	Insol. in HCl.	Total.
29.09	22.60	0.83	46.26	0.79	99.57
29.86	21.09	1.33	46.03	1.04	99.35

L. J. S.

[Turquoise and Phosphorochalcite.] By THEODOR PETERSEN (*Jahrb. Min.*, 1900, ii, Ref. 31; from *Jahresber. physik. Ver. Frankfurt a. M.*, 1896—1897, 1898, 4 pp.).—Sky-blue or green turquoise occurring as veins in weathered porphyrite at Borrow Mts., New Mexico, gave analysis I, which, after deducting 4CuO, P₂O₅ and 3CaO, P₂O₅, agrees with the formula 2Al₂O₃, P₂O₅, 5H₂O. When heated, it decrepitates violently and falls to dark brown powder.

Crystalline phosphorochalcite ("ehlite"), occurring sparsely in a quartz vein in sericite-schist at Frauenstein near Wiesbaden, gave II, agreeing with the formula $5\text{CuO}, \text{P}_2\text{O}_5, 3\text{H}_2\text{O}$. No water is lost below 150° .

	P_2O_5	Al_2O_3	Fe_2O_3	CuO	CaO	$\text{MgO}, \text{K}_2\text{O}, \text{Na}_2\text{O}$	SiO_2	Loss on ignition.	Total.
I.	27.09	32.14	1.33	4.92	5.23	0.89	8.71	15.58	99.89
II.	24.16	—	—	67.08	—	—	—	9.03	100.27

L. J. S.

A Mineral of the Columbite Group. By WILLIAM L. GOODWIN and WILLET G. MILLER (*J. Fed. Canadian Mining Inst.*, 1898, 3, 151—152; and *Rept. Bureau Mines, Toronto*, 1898, 7, 234—237).—This was found embedded in the felspar of a pegmatite containing also beryl, tourmaline, &c., at Lyndoch, Renfrew Co., Ontario. Sp. gr. 5.38. Analysis gave:

$(\text{Nb}, \text{Ta})_2\text{O}_5$	SnO_2	FeO	MnO	CuO	$(\text{Ce}, \text{Di}, \text{Y})_2\text{O}_3$	Total.
75.75	0.92	11.14	10.22	0.03	2.00	100.16

L. J. S.

Fedorowite. By CARLO VIOLA and E. H. KRAUS (*Zeit. Kryst. Min.*, 1900, 33, 36—38).—The new name fedorowite was originally given to a pyroxene which, from its optical characters, should have occupied a place between ægirine-augite and ægirite (Viola, *Jahrb. Min.*, 1899, i, 121). The following analysis (mean of two), however, shows that it resembles diopside in composition. The light green crystals occur in various volcanic rocks in the province of Rome; they are strongly pleochroic, and the angle of optical extinction on $b(010)$ is $c:r = 65-75^\circ$; $2V < 50^\circ$.

SiO_2	Al_2O_3	Fe_2O_3	FeO	CaO	MgO	Na_2O	Total.
52.36	2.42	2.24	1.94	24.57	14.53	2.29	100.35

Fedorowite is therefore now defined as a pyroxene with the composition of diopside, but with optical characters approaching those of ægirite.

L. J. S.

Pyroxene from Moravia. By A. PELIKAN (*Tsch. Min. Mitth.*, 1900, 19, 338—339).—The following analysis by R. von Zeynek proves a pyroxene from crystalline limestone at Altstadt, Moravia, to be diopside. The same material is described crystallographically in an earlier paper (*Tsch. Min. Mitth.*, 1899, 19, 106—110).

SiO_2	Al_2O_3	Fe_2O_3	FeO	CaO	MgO	Na_2O	H_2O	C.	Total.
51.76	1.65	0.35	0.69	25.78	18.35	0.86	0.51	0.52	100.47

L. J. S.

Pyroxene from Latium. By FERRUCCIO ZAMBONINI (*Zeit. Kryst. Min.*, 1900, 33, 39—56).—Detailed crystallographic descriptions are given of the black and of the green crystals of monoclinic pyroxene from the volcanic rocks near Rome. Analysis of the black crystals gave I, and of the light green II. Another light green crystal of the same tint as II contained only 4.37 per cent. FeO ; green crystals which are darker in colour contain more iron.

	SiO ₂	TiO ₂	Al ₂ O ₃	Fe ₂ O ₃	FeO.	MnO.	CaO.	MgO.	Total.
I.	48.86	0.37	5.23	1.71	10.02	0.23	24.34	8.35	99.12
II.	—	—	—	0.60	5.58	—	—	—	—

There appears to be no connection between the amount of iron and the angle of optical extinction. The crystals contain enclosures of magnetite, &c.

L. J. S.

Felspar Studies. By CARLO VIOLA (*Zeit. Kryst. Min.*, 1900, 32, 305—337).—Crystallographic and optical determinations of albite are given. Analysis I is of albite, from Amelia Co., Virginia; II, of pericline from the Kramkogel, Rauris, Salzburg.

	SiO ₂	Al ₂ O ₃	CaO.	MgO.	Na ₂ O.	K ₂ O.	Total.

Complicated formulæ in accordance with Rheineck's views (*Abstr.*, 1899, ii, 601) are given.

L. J. S.

Alkali-syenite from Massachusetts. By FRED. EUG. WRIGHT (*Tech. Min. Mitth.*, 1900, 19, 308—320).—Alkali-syenite (umptequite) occurring at Beverley, Massachusetts, consists essentially of microperthite and an alkali-hornblende, with some microcline, diopside, lepidomelane, apatite, zircon, &c. Analysis of the rock gave II; sp. gr. 2.732. The alkali-hornblende is greenish-black; sp. gr. 3.44; in its optical characters ($\epsilon : c = 20^\circ 35'$, $2E = 63^\circ 22'$, &c.) and composition, anal. I giving the formula

it is related to barkevikite, arfvedsonite, and hastingite (*Abstr.*, 1896, ii, 374).

	SiO ₂	TiO ₂	Al ₂ O ₃	Fe ₂ O ₃	FeO.	MnO.	CaO.	MgO.	Na ₂ O.	K ₂ O.	H ₂ O.	Total.

New Variety of Garnet. By W. A. MACLEOD and O. E. WHITE (*Papers and Proc. R. Soc. Tasmania*, for 1898—1899, 1900, 74—76).—A trachyte, from Port Cygnet, Tasmania, consisting of sanidine and biotite, contains numerous crystals of brownish-yellow garnet, which show trapezoidal faces and are sometimes $\frac{1}{4}$ in. diam. Analysis of the garnet gave I, and of the rock II. In the relative proportions of the bases, this differs from other garnets, and the name *johnstonotite* (after

R. M. Johnston) is proposed. [The formula, however, only approximates to the garnet formula even when all the iron is calculated as Fe_2O_3 .]

	SiO_2	Al_2O_3	FeO	MgO	CaO	MnO	Na_2O	K_2O	Ign.	Total

[Ivaarite.] By VICTOR HACKMAN (*Bull. Comm. Géol. Finlande*, 1900, No. 11, 11).—The following mineral analysis is given in a petrological paper (pp. 1—45) on the rocks associated with ijolite at Iivaara, Kola Peninsula, Finland. Ivaarite (Iiwaarit) occurs as an accessory constituent in the ijolite (a holocrystalline nepheline-pyroxene rock); the following analysis, by M. Dittrich, gives further proof of the identity of ivaarite with schorlomite.

	SiO_2	TiO_2	Al_2O_3	Fe_2O_3	FeO	MnO	MgO	CaO	Total
	27.35	16.44	1.50	20.09	2.90	trace	0.82	30.99	100.09

L. J. S.

Meteoric Irons. By EMIL W. COHEN (*Ann. k. k. naturhist. Hofmus. Wien.*, 1900, 15, 74—94).—New analyses by J. Fahrenhorst are given of the following irons.

Salt River, Kentucky. In structure (octahedral with fine lamellæ) and composition (anal. I) this resembles the Ballinoo and Tocavita irons, (Abstr., 1898, ii, 440; 1899, ii, 307). Sp. gr. 7.6648.

Cape of Good Hope. Anal. II. Sp. gr. 7.8543. This resembles the Kokomo and Iquique irons.

Babb's Mill, Green Co., Tennessee. Analysis III and IV are of material from different portions of the mass described by Blake in 1886 under the name Green County; V is of the Babb's Mill mass described by Troost in 1845. Although these differ considerably in chemical composition, they probably represent the same fall since both belong to the rare type of ataxites rich in nickel.

Physiological Chemistry.

Mass and Oxygen Capacity of Blood in Man. By JOHN S. HALDANE and J. LORRAIN SMITH (*J. Physiol.*, 1900, 25, 331—343).—A full account of experiments previously published (this vol., ii, 416). The main conclusions are the following: The mass of the blood in man is about 4.9 per cent. of the body weight, and varied in fourteen persons from 3.34 to 6.27. The total oxygen capacity of the blood in litres is 0.85 per cent. of the body weight in kilograms, and varied between 0.57 and 0.95. The percentage oxygen capacity is 18.5 per cent., the limits being 16.0 and 20.9. The oxygen capacity of blood, even from different animals, varies in direct proportion to its colouring power, and may be accurately determined colorimetrically by reference to blood of known oxygen capacity. W. D. H.

Absorptive Power of Hæmoglobin for Oxygen and Carbon Monoxide. By L. G. DE SAINT MARTIN (*Compt. rend.*, 1900, 131, 506—509).—One gram of hæmoglobin always absorbs the same volume of both oxygen and carbon monoxide. Although the absorptive power for the two gases is equal, it is not a fixed quantity. G. Hüfner (*du Bois Reymond's Archiv*, 1894, 130) gives, as the result of a number of observations, the number 1.34, which represents the number of c.c. of oxygen absorbed by 1 gram of hæmoglobin. In the present research, the numbers obtained in seven observations on dogs' blood are respectively 1.35, 1.22, 1.35, 1.33, 1.34, 1.20, and 1.35. The figures obtained from various pathological specimens of human blood are as follows: 1.305, 1.19, 1.33, 1.26, 1.22, 1.18, 1.26, 1.34. This variation cannot be accounted for by any change in the blood-pigment that can be detected by the spectro-photometer. W. D. H.

Agglutination of Blood Corpuscles by Chemical Agents. By E. HÉDON (*Compt. rend.*, 1900, 131, 290—292).—In solutions of non-dissociable substances, such as sugar, very weak doses of acid (mineral or organic) produce agglutination of blood-corpuscles, but in solutions of electrolytes, such as salts, this is not the case. The addition of a certain quantity of neutral salt in the former case prevents the agglutination, or, if agglutination has occurred, produces disagglutination. W. D. H.

Changes in the Composition of the Blood after Transfusion of Sodium Chloride, and their Relationship to Diuresis. By R. MAGNUS (*Chem. Centr.*, 1900, i, 1036; from *Arch. exp. Path. Pharm.*, 44, 68—103).—The experiments recorded were made on dogs. If large quantities of blood are first withdrawn, the blood drawn subsequently is more dilute; but if the first withdrawal does not exceed 8 per cent. of the total blood in the animal, the blood drawn afterwards is more concentrated; this is due to increase in the amounts of hæmoglobin and proteid; the proportion of salts is not altered. After transfusion of 0.9 per cent. solution of sodium chloride, there is

diuresis, and proportionally more sodium chloride is excreted than water. Stronger salt solutions produce less diuresis. In some cases, sugar appears in the urine. After the injection of hypotonic solutions, the osmotic pressure sinks, and remains low until the diuresis comes to an end. The capillary wall has, therefore, the power to rapidly regulate the osmotic pressure of the blood. Diuresis is a result of dilution of the blood. By the use of strong salt solutions, water enters the blood from the tissues.

W. D. H.

Functions of the Nucleus in Relation to Hæmoglobin Formation and Cellular Protection. By HENRI STASSANO (*Compt. rend.*, 1900, 131, 298—301).—In studying the absorption of iron saccharate in the peri-oesophageal membrane of the frog, it was noticed that the nuclei of the endothelial cells and of the blood-corpuscles absorb the iron. In the case of the blood-corpuscles, the chromatin of the nucleus diffuses into the cell-protoplasm in order to combine with the salt injected. The same diffusion of chromatin was noted in certain changes of environment (reaction, temperature, &c.) of the corpuscles. The nucleus is believed, therefore, to be a protective agent, as well as being concerned in the assimilation of nutriment and elaboration of hæmoglobin.

W. D. H.

Influence of Acids on the Amylolytic Action of Saliva. By G. A. HANFORD (*Amer. J. Physiol.*, 1900, 4, 250—260).—It is not possible to designate any percentage of acid or alkali which inhibits salivary digestion in a definite degree. The character of the action is dependent also on the absolute amount of the saliva and the attendant variation in the quantity of proteid matter present. Whenever free hydrochloric acid is present, more or less complete inhibition is certain to result.

W. D. H.

End Products of Gastric Digestion. By MEINHARD PFAUNDLER (*Zeit. physiol. Chem.*, 1900, 30, 90—100).—Attention has been recently directed to the question of the nature of the substances formed during peptic activity which do not give the biuret reaction. In the present research, the digestion was allowed to go on for some months, the albumoses were removed by zinc sulphate, and the peptone by iodine or by phosphotungstic acid; the last-named substance precipitates other products also. In the case of serum-albumin, the final filtrate contained 39.7 per cent. of the total nitrogen. Among the products separated out were leucine and a diamino-acid, probably histidine. In the case of fibrin, leucine was not found. The principal end products appear to be substances intermediate between peptone and the amino-acids; these do not give the biuret reaction, and contain more than one carbon nucleus; in the case of serum albumin at least, a leucine and diamino-nucleus are present.

W. D. H.

Quantitative Relationships of Pepsin Activity. By JULIUS SCHÜTZ (*Zeit. physiol. Chem.*, 1900, 30, 1—14).—E. Schütz (Abstr., 1885, 1147) stated that the amount of the products of peptic activity was proportional to the square root of the amount of pepsin. The method used was to estimate the products by their rotatory power. This statement has been but little credited. It was, however, con-

firmed by Borissow (*Inaug. Diss. Petersburg*, 1891), who used Mett's capillary tube method. In the present research, various proteids were used, and the amount of digestive products was estimated by nitrogen determinations. The rule is again confirmed, and it is believed to hold for other enzymes also. One example will suffice :

Amount of solution of pepsin in c.c.	Digested nitrogen in grams.	
	Found.	Calculated.
1	0.0230	0.0223
4	0.0427	0.0446
9	0.0686	0.0669
16	0.0889	0.0892

W. D. H.

Nutritive Value of Hetero-albumose from Fibrin, and Proto-albumose from Casein. By LEON BLUM (*Zeit. physiol. Chem.*, 1900, 30, 15—44).—The experiments were performed on a dog. They show that all proteoses have not the same nutritive value, and that of the two investigated, the caseose is the more valuable. The following table illustrates this :

Food.	Nitrogen.		Balance.
	Intake.	Output.	
1a. Meat	14.12	13.81	+ 0.31
1b. Hetero-albumose ...	14.12	15.30	- 1.18
2a. Meat	14.7	14.0	+ 0.7
2b. Proto-caseose	14.7	14.4	+ 0.3

A discussion follows as to why this should be. Investigation of the substances given as food in relation to the way in which their nitrogen is combined by Hausmann's method did not yield an answer to the question.

W. D. H.

Comparative Absorption [Digestibility] and Velocity of Hydrolysis of Certain Fats. By H. LÜHRIG (*Chem. Zeit.*, 1900, 24, 646—648. Compare this vol., ii, 224, 355 ; Kreiss and Wolf, *ibid.*, 324).—According to König, butter is readily digested because it is so easily hydrolysed. Comparative experiments made by the author on butter, margarine, lard, cotton-seed oil, sesame oil, and cocoanut butter indicate that in all five cases the hydrolysis proceeds similarly and to appreciably the same extent when cold alcoholic potash of a given strength is employed. There thus appears to be no relationship between the ease with which a fat is absorbed and the readiness with which it is hydrolysed.

J. J. S.

Absorption of Coloured Fats. By EDUARD PFLÜGER (*Pflüger's Archiv*, 1900, 81, 375—380).—Hofbauer (this vol., ii, 605) has stated that fat particles are absorbed as such, for if the fat is artificially coloured, the fat droplets in the epithelial cells are still coloured. The pigments used are insoluble in water. The present research shows that although the pigments are insoluble in water they are soluble in bile, in soaps, and in glycerol. Hofbauer's work gives therefore no proof that fat is absorbed as an emulsion.

W. D. H.

Absorption of Fat. By HANS FRIEDENTHAL (*Centr. Physiol.*, 1900, 14, 258—261).—Hofbauer's work, although conclusive at first sight, really does not solve the question of fat-absorption. The absorption of fat in the large intestine where there is an absence of steapsin (Hemmeter, this vol., ii, 607) either shows that neutral fat can be absorbed as such, or that the first part of the epithelial cells is analytic, and the deeper portion synthetic in its action. The main objection to Hofbauer's method is that the pigments he used are soluble, not only in fat, but also in fatty acid. This is regarded as a more important objection than those urged by Pflüger (see preceding abstract). In fact, it is stated that alkanna is not soluble in soaps unless free fatty acid is present as well. W. D. H.

Formation of Fat in the Animal Organism by Intensive Feeding of Fat. By V. HENRIQUES and C. HANSEN (*Expt. Stat. Record*, 1900, 11, 674—676; from 44^{te} *Ber. k. Vet. Landbohøjsk. Lab. Landökon. Forsög.*, 1899).—Two pigs (3 months old) were fed during 168 days with ground barley and melted cocoanut, or linseed oil mixed with water. At suitable intervals a few grams of fat were taken from the backs of the animals and examined. The daily amount of oil was gradually increased from 125 to 400 grams.

The results showed that linseed oil was present in the newly-formed fat. At the conclusion of the experiments, when the animals were killed, large quantities of sativic acid (hydroxylinoleic acid) were found in the fatty tissue.

The iodine numbers for the fat of pig (1), which had cocoanut oil all the time, were: October 10, 70.3; December 12, 57.5; December 30, 71.8; February 1, 92.8, and March 17, 100.3. The refraction numbers at the same dates were 60.5, 56.9, 60.6, 64.2, and 65.4. The second pig, which had linseed oil until December 9, and afterwards cocoanut oil, gave the following results: iodine numbers, 70.9, 109.2, 88.3, 83.8, and 69.7; refraction, 60.8, 66.7, 64.2, 62.2 and 59.8.

Experiments with two cows are also described. The one had 0.5 kilo. of emulsified linseed oil in addition to hay, ground barley, and linseed meal, the other 0.5—1 kilo. of oil. During the first 4—6 days, the percentage of fat in the milk was increased in some cases by almost 1 per cent.; subsequently, however, the percentage of fat became normal, notwithstanding that feeding with oil was being continued. The yield of milk changed in the same manner as the percentage of fat in the milk.

During the feeding with oil the volatile fatty acids of the butter fat greatly decreased; the lowest Reichert numbers obtained were (cow 1) 16.5, and (cow 2) 12.5 for 5 grams of fat. The amounts of volatile fatty acids only slowly became normal after the oil-feeding was discontinued. The iodine number and index of refraction changed rapidly both with oil feeding and after it was discontinued; the highest iodine number obtained was 70.4. The melting point of the butter fat increased from 35.4° (normal food) to 39° (linseed oil, 0.5 kilo.). Sativic acid was found only in small quantities in the butter fat; there was therefore no important transfer of food fat to the milk. At the same time, the results of the Hübl test showed

that Soxhlet's theory is wrong, since the iodine number of beef fat is 40, whilst that of the butter fat obtained during the oil-feeding was about 58. Partially starved cows yield milk in which the amount of volatile fatty acids remains practically unchanged, whilst the iodine number is raised and the melting point lowered. This would seem to indicate a migration of the liquid constituents (olein) of the fatty body-tissue to the milk.

The conclusion is drawn that when much fat is supplied in the food, it is secreted as milk fat after having been transferred to the blood. The transmission is not, however, direct; in the alveolar cells of the milk gland, the fat will be transformed in such a manner that much olein and a small amount of fat having a high melting point (stearin ?) are formed. Large amounts of drying oil in the food will be changed to non-drying oils before being secreted in the milk. N. H. J. M.

Origin of Volatile Fatty Acids in Butter. By NATHAN ZUNTZ and Usow (*Chem. Centr.*, 1900, i, 1135; from *Arch. Anat. Phys. Physiol. Abth.*, 1900, 382—384).—It is well known that the fat of cow's milk is rich in lower glycerides, whilst that of human and dog's milk is not. In the expectation that this might depend on the absorption of lower fatty acids produced by fermentation from carbohydrates during digestion, a dog was fed on butter, butyric acid, and sodium butyrate, but the amount of volatile fatty acid did not rise in the milk. It therefore appears that in the cow these volatile acids are actually formed in the mammary glands. W. D. H.

Mineral Metabolism in the Naturally and Artificially Fed Infant. By MAGNUS BLAUBERG (*Zeit. Biol.*, 1900, 40, 1—35, 36—53).—The mineral metabolism in infants is important in view of such diseases as rickets. Observations are here recorded on four children, each fed in a different way; the inorganic constituents of urine and faeces were examined in detail. In one fed on diluted cow's milk, 53·72 per cent. of the saline constituents were absorbed, and the remainder passed away in the faeces. Of the individual salts, the sodium compounds were absorbed best (87 per cent.); the numbers for potassium salts, chlorides, phosphates, and calcium oxide were respectively 67·6, 59·3, 46·6, and 37·25. There is a loss of iron. The proportion is seen to be different from that required by the needs of the organism. The results compare unfavourably with those obtained in another child fed on human milk. The results are still more unfavourable if Kufeke's meal and water are used instead of milk. Here the balance is often on the wrong side (salt-hunger). If undiluted cow's milk is employed, a condition of over-nutrition is noted. W. D. H.

Proteid-Metabolism during Gelatin-Feeding. By JOSEPH KIRCHMANN (*Zeit. Biol.*, 1900, 40, 54—94).—Experiments were performed on a dog to determine to what degree gelatin acts as a proteid-sparing food. The gelatin was practically all absorbed; traces only were found in the faeces. If gelatin in amount corresponding with 12 per cent. of the necessary energy is given, proteid decomposition is lessened by 27 per cent. Increase of the administered gelatin

beyond this lessens proteid katabolism in a proportionally small degree, thus gelatin to the extent of 62 per cent. lessens the proteid decomposition by 35 per cent. This was the maximum obtained. A discussion of the results of previous workers is added. W. D. H.

Influence of Sodium Chloride Solution Injected Subcutaneously on Proteid Metabolism. By OTTO KRUMMACHER (*Zeit. Biol.*, 1900, 40, 173—179).—The question what influence physiological salt solution has on metabolism is important, because it is so frequently used as a vehicle for other substances. Biernacki (*Zeit. Klin. Med.*, *Suppl.* 19, 49—86) states that after injecting 100 to 300 c.c. of a 0·7 per cent. solution of sodium chloride in dogs proteid katabolism is increased by 70 per cent. His methods are criticised, and a repetition of his experiments shows that the increase is very small. Before the injection, the excretion of nitrogen averaged 2·56 grams daily; this was raised to 2·75 by the injection of 210 c.c. of the saline solution. The amount of sodium chloride in the urine was increased.

W. D. H.

Influence of Sodium Salicylate on Metabolism. By FRANCIS W. GOODBODY (*J. Physiol.*, 1900, 25, 399—413).—Sodium salicylate in man causes increased katabolism of proteid material; this leads to an increase of nitrogen, particularly in the form of urea, which is excreted. It does not influence general metabolism, or absorption of fats or proteids.

W. D. H.

Rôle of Arsenic in Connection with the Menstrual Flow. By ARMAND GAUTIER (*Compt. rend.*, 1900, 131, 361—367).—Administration of arsenic improves the skin and its appendages, and lessens the intervals between the menstrual epochs. Much the same is true for iodine. The thyroid is of all the organs the richest in these two elements. Arsenic is absent in healthy blood, except during menstruation, when 0·28 milligram per kilogram of blood are present. Iodine also increases in the menstrual blood. The fall of hair, and epithelial desquamation are in man considered sufficient to balance the arsenic and iodine metabolism of the thyroid. In woman, the balance is assisted by the menstrual flow. Examples are quoted from man and animals to emphasise the inter-relationships of the functions of skin, thyroid, and genital organs.

W. D. H.

Metabolism of Iodine. By PAUL BOURCET (*Compt. rend.*, 1900, 131, 392—394).—Iodine does not exist merely in the thyroid and the blood, but in smaller quantities in most of the tissues and organs. Analytical figures in dog and rabbit are given. A man takes in his food about 0·33 milligram of iodine daily. It is eliminated principally by the epidermis and skin glands; the hair and nails are particularly rich in this element. They contain also about the same quantity of bromine. In woman, where the fall of hair is not such a marked occurrence, the excess is carried off in the menstrual discharge.

W. D. H.

Glycogen Formation after Inulin Feeding. By R. NAKASEKO (*Amer. J. Physiol.*, 1900, 4, 246—250).—The experiments show that

the glycogen-forming properties of inulin in the case of the rabbit are uncertain or minimal.
W. D. H.

Formation of Lactose. By BENJAMIN MOORE and WILLIAM H. PARKER (*Amer. J. Physiol.*, 1900, 4, 239—242).—It has been generally assumed that the mammary glands form, and not merely excrete, lactose, and that this substance when found in the urine arises from absorption from the charged gland cells, but this hypothesis does not appear to have been experimentally demonstrated. The present experiments on goats show that it is well founded. The mammary glands were removed; parturition occurred, but the urine remained practically normal; certainly no lactose was found in it.

W. D. H.

Connective Tissue in Muscle. By J. H. GOODMAN (*Amer. J. Physiol.*, 1900, 4, 260—263).—The connective tissue can be separated from muscle by a simple mechanical process first described by E. Schepilewsky (*Arch. Hyg.*, 1899, 34, 348), and among its constituents this observer describes a mucin. It is here shown, however, that the substance precipitated by acetic acid yields no reducing substance, and contains as much as 16 per cent. of nitrogen; it is therefore not mucin, neither is it a nucleo-proteid. The gelatin obtained gives Millon's reaction; the old statement that gelatin does not give this reaction is incorrect.

W. D. H.

Chemistry of the Brain. By N. ALBERTO BARBIERI (*Compt. rend.*, 1900, 131, 347—349).—When brain matter was kept at 45° for 12—18 hours, carbon dioxide came off to the amount of about 1 c.c. for each gram of brain taken. The residue, on distillation, yields a small quantity of alcohol. The other substances separated are loosely described as (1) the hydrochloride of a ptomaine, (2) a substance of phenolic nature, (3) a crystalline material intermediate between leucine and butalanine, (4) cholesterol, margarine, stearin, olein, (5) a substance with a fishy odour, and (6) a residue which probably consists largely of keratin.

W. D. H.

Thyroid Gland of Sheep. By TH. SUIFFET (*J. Pharm.*, 1900, [vi], 12, 50—53).—With sheep grazed on inland pastures the amount of iodine in the thyroid gland varies from 0.0735 to 0.088 per cent., whilst with sheep from pastures near the sea or near salt marshes it varies from 0.121 to 0.140. It is probable that the high percentage of iodine in the latter case is due to the presence of *Salicornia*, *Salsola soda*, and *Atriplex portulacoides* in the pasturage; an analysis of the ash of these plants, however, will be necessary to confirm this view.

W. A. D.

Fermentative Decomposition of Proteid, and Ammonia Formation in the Liver. By MARTIN JACOBY (*Zeit. physiol. Chem.*, 1900, 30, 149—173).—Changes in the Liver during Phosphorus Poisoning, and their Relation to Autolysis (*ibid.*, 174—181).—Loewi (Abstr., 1898, ii, 617) has stated that by the action of liver ferment solutions on glycine, a substance soluble in ether or

alcohol is obtained which is not urea, but contains easily detachable nitrogen. The present investigation was originally undertaken to determine what this substance is, but resulted in the discovery of an ammonia-forming enzyme in the liver. A number of experiments were performed in which glycine was added to liver juice, in order to see if any increase in the nitrogen which can be driven off by magnesia took place; this was not found. In liver juice preserved by the addition of toluene, it was, however, observed that without any further addition, and in the absence of putrefaction, the amount of this loosely combined nitrogen rose considerably; in one experiment, in which a sample of the aqueous liver extract was examined daily, the amount of this nitrogen rose gradually in 20 days from 0.0013 gram to 0.00675 per 20 c.c. This does not occur when the extract is boiled and then kept. The nitrogen is found to correspond in amount mainly with the quantity of ammonia newly formed, and this arises from an increase of amino-nitrogen and a lessening of proteid. In fact, it is believed that this is a case of Salkowski's auto-digestion or autolysis, and will occur, not only in extracts, but also in the cells of the organ. Albumoses (but not peptone) and basic products are also formed. The autolysis differs in many important particulars from tryptic activity, particularly in selecting the globulin of the liver for destruction. The enzyme can be thrown down by ammonium sulphate, but more of this salt is needed than in the case of the liver aldehydase. The solutions obtained as the result of this autolytic activity are able to decompose solutions of hippuric acid with the formation of benzoic acid, and solutions of urea are decomposed also with the formation of ammonia, but whether this is due to the same or other enzymes is left an open question. The liver juice injected intravenously does not affect coagulation, but in a few experiments *in vitro* the coagulation of the blood was hindered, and in one case where coagulation took place 'fibrinolysis' occurred rapidly afterwards; boiling the juice did not affect this action. The autolytic decomposition of the liver is believed to occur *intra vitam* under conditions in which putrefaction is excluded, and increase in this normal function is stated to be the principal underlying pathological factor leading to the destruction of the liver substance and formation of leucine, tyrosine, ammonia, &c., in acute atrophy and phosphorus poisoning.

W. D. H.

Human Chyle. By THEODOR PANZER (*Zeit. physiol. Chem.*, 1900, 30, 113—116).—Owing to surgical interference, it became possible to obtain specimens of chyle from the thoracic duct of a woman.

It was alkaline, and became clear on shaking with ether. Microscopically, it showed fat particles and leucocytes. The proteids were albumin and traces of globulin, whilst albumoses, peptone, sugar, lecithin, urea, and uric acid were absent. Cholesterol, neutral fats, soaps, and a diastatic ferment were present. The inorganic salts were chiefly chlorides, sulphates, and phosphates of sodium and potassium. Four specimens were examined, and the main results are as follows:

Water	90.29 to 94.53 per cent.
Solids	5.47 " 9.71 "
Organic substances	4.53 " 8.91 "
Inorganic salts.....	0.8 " 1.04 "
Coagulable proteid	2.16, one determination only
Substances soluble in ether...	6.59 " " W. D. H."

Properties and Formation of Lymph. By LEON ASHER and WILLIAM J. GIES (*Zeit. Biol.*, 1900, 40, 180—216).—This is another contribution to the much discussed question whether lymph is formed by purely mechanical processes. After intravenous injection of sugar, quinine does not influence the quantity or composition or amount of sugar in the lymph. This does not exclude a 'physiological' factor in lymph formation, even although quinine is a capillary poison. The action of 'liver poisons' (Heidenhain's first class of lymphagogues) is inhibited by quinine. Liver activity is at least one 'physiological' factor, and quinine is known to lessen the action of this organ so far as its glycogenic and urea forming functions are concerned. The action of liver poisons cannot be simply explained as due to an increase of the permeability of the capillary walls in the liver. Arsenic is a typical 'capillary poison,' and leads to an increased flow of highly concentrated lymph. The injury to the vessel walls is much greater than that produced by crabs' muscle and leech extracts, still the formation of lymph is greater if these weaker reagents are used. These facts are emphasised when it is considered that the formation of lymph goes on for a short time *post-mortem*. This is analogous to what occurs in *post-mortem* formation of saliva, and is a proof that the two depend upon similar physiological processes.

W. D. H.

Excretion in the Small Intestine. By CYRIL CORLETT (*J. Physiol.*, 1900, 25, 344—355).—In a closed segment of ileum, a large mass accumulates, as originally shown by Hermann. The amount varies, and may depend on the amount of stimulation of the mucous membrane by bacterial products. Possibly some reabsorption occurs, and substances difficult of absorption like nuclein tend to accumulate. The mass contains iron, and calcium phosphate from the *débris* of shed cells; soaps are also present. More or less of the faecal pigment is derived from the shed bowel epithelium. None of the dogs experimented upon, five in number, exhibited any symptoms due to poisoning from bacterial products.

W. D. H.

Action of the Liquid of the External Prostate on the Liquid of the Vesiculæ Seminales. By L. CAMUS and EUGÈNE GLEY (*Compt. rend.*, 1900, 131, 351—353. Compare Abstr., 1899, ii, 779).—The secretion of Cowper's glands or of the external prostate of the hedgehog produces an agglutinating action on the formed elements of the liquid secreted by the *vesiculæ seminales* and also the precipitation of a proteid substance in the same fluid.

W. D. H.

Properties of the Secretion of the Internal Prostate of the Hedgehog. By L. CAMUS and EUGÈNE GLEY (*Compt. rend.*, 1900, 131, 353—355).—The secretion of the internal prostate has the same properties as that of the external prostate (see preceding abstract). In the case of the internal prostate, however, this does not depend on the presence of the substance named vesiculin. W. D. H.

Peculiarities in the Urine of Vegetarians. By JOHN H. LONG (*J. Amer. Chem. Soc.*, 1900, 22, 592—595. Compare this vol., ii, 580).—Results are quoted of the analyses of the urine of seven men who, for a year or longer, had lived wholly on a vegetarian diet. The average daily excretion for a vegetarian appears to be 874 c.c. as against 1167 c.c. for non-vegetarians. If due allowance be made for the difference in concentration between a normal and vegetarian urine, the most striking feature is the small amount of creatinine in the latter, and this probably points to low metabolism, the subjects of experiment taking but little exercise. The reducing power due to carbohydrates and similar substances is somewhat higher than in the case of a normal urine. J. J. S.

Estimation of Amino-acid Nitrogen in Urine. By MEINHARD PFAUNDLER (*Zeit. physiol. Chem.*, 1900, 30, 75—89).—The total nitrogen of the urine was estimated in four fractions: (1) The nitrogen in the substances precipitable by phosphotungstic acid, which can be split off by phosphoric acid. This includes that from ammonia, carbamic acid, and a part of that from the uric acid, purine bases, urine-mucoid, and other proteids of normal urine. (2) The nitrogen in the same precipitate which cannot be split off by phosphoric acid; this includes the remainder of that from substances like uric acid, of which only a part of the nitrogen is firmly combined, also that from diamines, diamino-acids, and ptomaines. (3) The nitrogen which is easily split off in the urine *minus* the phosphotungstic precipitate; this includes that from urea, allantoin, oxaluric acid, and a part of the creatinine. (4) The firmly combined nitrogen in the substances not precipitable by phosphotungstic acid. This includes that from amino-acids and their derivatives, hippuric acid, taurine and cystine compounds, and in pathological urines, leucine, tyrosine, &c. In this last fraction, oxyproteic acid comprises from 41 to 46 per cent. of the whole. In urine containing albumin and albumose, the first fraction is increased by the amino-nitrogen of the proteids, and the second by Hausmann's mono- and di-amino-nitrogen. In all cases the ammonia can be estimated separately by Schloesing's method. The following table summarises the results obtained. The most marked result seen is the rise, in phosphorus poisoning, of the fourth fraction (due to amino-acids) and in the ammonia, at the expense, presumably, of the urea:

	Fraction 1	2	3	4	Ammonia.
Normal human urine	8.34	6.65	80.14	4.88	—
Dog. 1 normal urine	7.67	5.10	84.97	2.26	4.33
during phosphorus poisoning	7.73	5.24	81.89	5.13	5.77
Dog. 2 normal urine	7.00	2.24	86.43	4.33	4.03
during phosphorus poisoning	7.13	2.10	83.76	7.01	5.59

W. D. H.

Loosely Combined Sulphur in the Urine. By EUGEN PETRY (*Zeit. physiol. Chem.*, 1900, 30, 45—60).—The so-called 'neutral sulphur' of the urine is an ill-characterised quantity and is combined in various compounds. An important and easily determinable fraction of this, however, is that which can be readily split off as a metallic sulphide. In the dog on a mixed diet, and on a diet of flesh only, its amount varies slightly, namely, from 1 to 3 per cent. of the total sulphur. By feeding with casein, a proteid relatively poor in sulphur, the percentage varies from 3 to 3·15; with serum-albumin and serum-globulin from 1·1 to 2·2; with hetero-albumose (which contains a high percentage of easily dissociable sulphur), 5·5. Feeding with asparagus shoots has no influence. In phosphorus poisoning, the amount is slightly raised; in cases of liver cirrhosis and leucæmia, little departure from the normal is noticeable. Acetonitrile raises the amount, the increase being due to formation of thiocyanogen. Differences noted between different animals cannot be explained by variations in their diet. W. D. H.

Pseudomucin from Ovarian Cysts. By ZÄNGERLE (*Chem. Centr.*, 1900, i, 1035; from *Münch. med. Woch.*, 47, 414—415).—The pseudomucin from ovarian fluid yielded glucosamine after decomposition with hydrochloric acid. The reducing substance is therefore identical with that obtained by F. Müller from sputum and the sub-maxillary gland, and by Seemann from ovomucoid. In all these cases, the glucoproteid is a product of secreting cells. W. D. H.

Acetone Glycosuria. By WALTER RUSCHHAUPT (*Chem. Centr.*, 1900, i, 1036—1037; from *Arch. exp. Path. Pharm.*, 44, 127—141).—Acetone is present in normal urine in small quantities. In diabetes mellitus, the amount is increased. By acetone poisoning, produced by breathing acetone vapour, or by intravenous or subcutaneous injection of acetone, or by feeding on acetone, artificial glycosuria is produced. The sugar is derived from the carbohydrate constituents of the body, for in starving animals in which the glycogen has been reduced to a minimum, the glycosuria produced is very slight. W. D. H.

Antihepatic Serum. By C. DELEZENNE (*Compt. rend.*, 1900, 131, 427—429).—Since the publication of Bordet's work (*Ann. Inst. Pasteur*, 1898—1900) on artificial hæmolytic serums, various observers have sought to prepare serums which act specifically on different groups of cells or organs. The present communication relates to a serum which acts injuriously on the liver cells. If an emulsion of dog's liver is injected intraperitoneally in rabbits and ducks, a serum is obtained from the blood of these animals which is strongly poisonous to the dog. If 2—4 c.c. of the serum are injected intraperitoneally or intravenously, death results, and the symptoms and *post-mortem* pathological appearances are almost exclusively of a hepatic nature. If death is rapid, the liver exhibits acute necrosis; if the animal lives a few days, the urea of the urine is lessened, and ammonia and amino-acids are increased; if carbohydrate food is given, there may be slight glycosuria; there is no

jaundice. After death, intense fatty degeneration of the liver cells is found. Small and gradually increasing doses of the serum create immunity; and the serum of an immunised animal has similar protective power.

W. D. H.

Syntheses in the Animal Organism. I. Piperidine Derivatives. By HERMANN HILDEBRANDT (*Chem. Centr.*, 1900, ii, 202—203; from *Arch. exp. Path. Pharm.*, 44, 278—316).—By the action of phenols and formaldehyde on piperidine, water is eliminated, and piperidides, which are usually crystalline compounds, are formed. "*Thymotinpiperidide*," $C_{16}H_{22}ON$, prepared from thymol, formaldehyde, and piperidine, melts at 149.5° . "*Carvacrylpiperidide*," similarly obtained from carvacrol, melts at 182° ; "*p-cresylpiperidide*" melts at 45° ; " *α -naphthylpiperidide*" and " *β -naphthylpiperidide*" melt at 135° and at 96° respectively.

The physiological action of thymotin-, carvacryl-, and *p*-cresylpiperidides on rabbits is, generally speaking, similar to that of piperidine. After administering thymotinpiperidide, the urine contains a glycuronic acid compound of "methylthymotinpiperidide"; it is a neutral crystalline substance, melts at 192° , and by boiling with hydrochloric acid yields a "methylthymotinpiperidide." Similar glycuronic acid compounds are obtained from other piperidides, and these substances are scarcely poisonous. By feeding with sucrose, dextrose, or maltose before administering the piperidide, its poisonous action is very much mitigated. Lævulose has a similar effect, but to a less extent, whilst lactose, galactose, dextrin, and mannitol are inactive in this respect; thus, it is only the sugars capable of forming glycogen in the organism which tend to form glycuronic acid compounds of these piperidides.

The physiological effects of the amide of tetramethylpyrrolinecarboxylic acid, its reduction product, and the methylamide of 1-methyltetramethylpyrrolinecarboxylic acid were also investigated.

E. W. W.

May Phenolphthalein be safely added to Marc-Wines? By ZOLTÁN VON VÁMOSSY (*Chem. Zeit.*, 1900, 24, 679—680).—The author's experiments were undertaken at the request of Liebermann, who wished to ascertain whether small quantities of phenolphthalein may be added, without any ill effect, to margarine and also to marc-wines to facilitate recognition. Experiments conducted first on rabbits, and afterwards on himself and a colleague, showed that a dose of 1—1.5 grams has no other effect than that produced by saline draughts or castor oil, whilst the long continued use of daily doses of 0.1 gram produced no unpleasant symptoms whatever.

Considering that 1 gram of phenolphthalein is sufficient for 100 litres of wine, the small quantity thus introduced into the system can do no possible harm, particularly as the bulk of the phenolphthalein passes through the system undecomposed.

L. DE K.

Physiological Action of Poehl's Spermine. By WALTER E. DIXON (*J. Physiol.*, 1900, 25, 356—363).—Spermine injected intravenously produces a temporary fall of blood pressure, which is partly

of cardiac origin and partly due to dilatation of the splanchnic blood-vessels. This result is not influenced by nicotine or by section of the vagi. Atropine cuts out the fall of pressure without influencing the splanchnic dilatation. The spleen is constricted; the testis is dilated; the renal vessels follow the blood-pressure passively. Spermine and choline are about equally toxic, and the similarity in their action is extremely striking. W. D. H.

Physiological Action of the Poisonous Secretion of the Gila Monster. By JOHN VAN DEUBURG and OTIS B. WIGHT (*Amer. J. Physiol.*, 1900, 4, 209—308).—A full account is given of experiments on dogs, cats, and frogs for the purpose of ascertaining the exact action on the various organs and functions of the body produced by the poison of the Gila Monster (*Heloderma suspectum*). The effects differ in no important respect from those of various snake venoms. No chemical examination of the poison itself is given.

W. D. H.

Iodine in Corals. By LAFAYETTE B. MENDEL (*Amer. J. Physiol.*, 1900, 4, 243—246).—Drechsel showed that the horny axial skeleton of the *Gorgonia cavolinii* contains iodine in organic combination. Several other workers have shown the same to be true for certain sponges and other marine organisms, and commented on the importance of iodine metabolism in certain animals. The present research shows the same is true for three other corals. The iodine apparently does not enter into the constitution of the true growing part of the animal. The following quantitative results are given; Drechsel's figures are added for comparison.

	Iodine.	Chlorine.
<i>G. cavolinii</i> (Drechsel)	7.79 per cent.	2.18 per cent.
<i>G. acerosa</i>	1.70 "	3.17 "
<i>G. flabellum</i>	1.15 "	1.24 "
<i>Plexora flexuosa</i>	0.28 "	0.86 "

W. D. H.

Colouring Matter of Echinus Esculentus. By ARTHUR B. GRIFFITHS (*Compt. rend.*, 1900, 131, 421—422).—The amorphous violet pigment of *Echinus esculentus* has the composition $C_{16}H_{12}ON_2$; when boiled with concentrated mineral acids, it yields leucine and formic acid.

W. A. D.

Chemistry of Vegetable Physiology and Agriculture.

Bacteriolysis of the Bacillus Anthracis. By G. MALFITANO (*Compt. rend.*, 1900, 131, 295—298).—Living protoplasm is believed to be capable of forming enzymes which ultimately destroy the protoplasm of the cells which produce them. Thus spontaneous destruction of bacteria (auto-bacteriolysis) is a possibility due to the production of a proteolytic enzyme by the bacteria. The experiments recorded

are stated to confirm this as a fact in the case of the *Bacillus anthracis*. Bacteriolysis occurs best in a neutral medium, and certain antiseptics are believed to owe their efficacy, not to their power of destroying protoplasm or counteracting enzymic action, but to the fact that, by altering the reaction of the medium, they allow spontaneous bacteriolysis to occur more readily.

W. D. H.

Gas Producing Power of *Bacillus Coli Communis* under Different Conditions of Environment. By MARY E. PENNINGTON and GEORGE C. KÜSEL (*J. Amer. Chem. Soc.*, 1900, 22, 556—567).—Cultures of this organism made on nutrient agar are most active, so far as gas production is concerned, when three days old, if kept at a temperature of 37°; older cultures produce less gas. The gas evolved under ordinary conditions consists of hydrogen 62—70, carbon dioxide 23—34, methane 1—4, and nitrogen 1—5 per cent. When grown in an apparatus from which oxygen is excluded, methane is not formed, and when grown in a medium free from meat extract, the amount of nitrogen evolved does not diminish.

There appears to be an intimate relationship between the reducing power which liberates hydrogen and that which produces nitrogen, but carbon dioxide is formed in largest quantity at the outset.

An apparatus consisting of two glass bulbs, one provided with a stopcock and attached to the other by rubber tubing, is recommended for experimental work of this kind.

J. J. S.

Physiology of Yeast. By ÉMILE DUCLAUX (*Chem. Centr.*, 1900, ii, 54—55; from *Allg. Hopf. Brauerz.*, 1900, 933).—A résumé and discussion of the physiological relationships of the yeast cell.

E. W. W.

Chemical Fermentation by Yeast in an Antiseptic Medium. By JOSEPH DE REY-PAILHADE (*Bull. Soc. Chim.*, 1900, [iii], 23, 666—668).—When brewer's yeast is quickly pressed and digested with a solution of maltose containing 1—1.2 per cent. of sodium fluoride, little action at first takes place, but after the third day a considerable evolution of carbon dioxide is noticed, and proteid substances are found to have entered into solution. In the first stage, the yeast is gradually destroyed by the antiseptic, whilst the later stage of more active change is due to the purely chemical action of ferments derived from the yeast. The evolution of gas is almost immediately arrested by the addition of sulphur, a fact which suggests that the ferments in question are closely related to philothion or hydrogenase (compare Abstr., 1899, i, 180).

N. L.

Germination. By LÉON MAQUENNE (*Ann. Agron.*, 1900, 26, 321—332).—The results of the author's experiments indicate that the predominating, if not the only, rôle in the conservation and development of seeds must be attributed to the diastases, and that the causes which retard the alteration of the diastases tend to maintain the germinating power of the seeds. When preserved under conditions, of which absence of moisture is the most important, favourable to the diastases remaining inactive, seeds may be kept indefinitely.

N. H. J. M.

Influence of Pressure on Chlorophyllous Assimilation. By JEAN FRIEDEL (*Compt. rend.*, 1900, 131, 477—479).—Experiments made with various plants in an atmosphere containing 10 per cent. by volume of carbon dioxide and at pressures between 1·0 and 0·25 atmosphere, show that within these limits the nature of chlorophyllous assimilation is not altered, and the quotient O_2/CO_2 remains practically unity. The intensity of the assimilation, however, diminishes regularly with the pressure. C. H. B.

Ashes of some Medicinal Plants. By ARTHUR B. GRIFFITHS (*Compt. rend.*, 1900, 131, 422—423).—Full analyses are given of the ash of sarsaparilla, hydrastis, cardamom, oak, rhatany, and belladonna; manganese is present in all these plants. W. A. D.

Phosphorus Compound first formed in Chlorophyllous Plants. Physiological Rôle of Inositol. By POSTERNAK (*Ann. Agron.*, 1900, 26, 362—265; from *Rev. gén. bot.*, 12, 5 and 12).—The results of experiments with seeds of *Picea excelsa* showed that a relatively small amount of the phosphorus is contained in the proteids, the greater part being in the filtrates from the proteids. Several organic compounds rich in phosphorus were obtained from the solutions.

One of these compounds, "oxymethylphosphoric acid," CH_3O_3P , forms brilliant tablets and is very hygroscopic. Its composition indicates that it is an additive compound of phosphoric acid and formaldehyde, and its production is a direct proof that carbon dioxide is converted into formaldehyde before being utilised in the production of plastic matters. When its barium salt is distilled during 5 or 6 hours with 40 per cent. acid, there is no production of formaldehyde, but an almost pure solution of inositol is obtained.

It is suggested that inositol may be formed in plants when formaldehyde is produced in excess; whilst the glucose formed at the same time is capable of being directly assimilated, inositol would be a reserve substance, retaining the excess of formaldehyde in a convenient form so as to be at the disposal of the cells if required. N. H. J. M.

Citric Acid in Saturation-Sludge. By KARL ANDERLEK (*Zeit. Zuckerind. Böhm.*, 1900, 24, 645—648).—Besides oxalic acid, the sludge was found to contain citric acid (0·16 to 1·21 per cent. in the dry matter), and a small amount of what is probably tricarballic acid.

Michaelis detected citric acid in beet-root juice in 1851 (*J. pr. Chem.*, 54, 184; compare also C. Schrader, *Annalen*, 1862, 121, 370).

N. H. J. M.

Presence of Vanillin in Vanilla. By JOHANNES BEHRENS (*Bied. Centr.*, 1900, 29, 547—549; from *D. Tropenpflanzer*, 1899, 299).—The fact that ripe vanilla has no odour may be due to the odour of vanillin being retained by the living protoplasm, or, as is more probable, the production of vanillin may only occur after the death of the fruit-cells. It was found that fresh leaves, or an extract of the leaves, acquire a distinct odour of vanillin when heated with dilute sulphuric or hydrochloric acid for 2 hours at 100°. The leaves contain, therefore, a soluble substance having the properties of a vanilla-glucoside. In the

natural treatment of the fruit, the breaking up into vanillin and sugar would be brought about by an enzyme. N. H. J. M.

Nitrogenous Substances in Malt. By PAUL PETIT and G. LABOUBASSE (*Compt. rend.*, 1900, 131, 394—396).—The authors denote the nitrogen precipitated with phosphotungstic acid and with zinc sulphate by *A* and *B* respectively, and that present in the ammonia evolved on boiling with dilute hydrochloric acid for 2 hours, by *C*; the nitrogen *A* is probably that of peptones, *B* that of albumoses, and *C* that of aminic substances. After adding hops and boiling for 2½ hours the nitrogen *A* and *C* of the malt, when water containing a small quantity of calcium sulphate is used, is partly changed into the form *B*; when sodium chloride is present in the water instead, the tendency is for *A* to change into *C*, *B* remaining constant; whilst with calcium hydrogen carbonate the change is less marked, *A* being formed at the expense of *B* and *C*. Saccharification is thus largely influenced by the nature of the mineral matter in the water employed. During fermentation, relatively small amounts of *C* are assimilated by the yeast, except in the presence of sodium chloride, when the proportion of *C* removed is large and that of *A* practically *nil*; the proportions of *A* and *B* absorbed, especially the latter, are large in all cases. W. A. D.

Milky Juice of Hura Crepitans. By J. J. SURIE (*Chem. Centr.*, 1900, i, 1210—1211; from *Ned. Tijds. Pharm.*, 12, 107—116).—The milky juice of *Hura crepitans* is an acid liquid of sp. gr. 1·05—1·06; it has a lingering, burning taste, and causes violent inflammation and swelling of the skin. The poisonous constituent, *hurin*, may be extracted by ether; it is volatile in steam, has a faint acid reaction, melts at 23°, and even in the form of vapour causes inflammation and eczema. E. W. W.

Analyses of Marine Algæ. By L. CUNIASSE (*Chem. Centr.*, 1900, ii, 286—287; from *Ann. Chim. anal. Appl.*, 5, 213—215).—The aqueous extract of 100—200 grams of ash is evaporated to dryness, and the residue distilled with manganese dioxide and sulphuric acid, the vapours being absorbed in aqueous caustic alkali. Iodine is precipitated with palladium nitrate, bromine and chlorine with silver nitrate.

The ash of the richer varieties of sea algæ contain, Br, 0·192—0·423; I, 0·602—1·408; Na₂O, 8·13—26·50, and K₂O, 8·70—23·03 per cent.; that of the poorer kinds, Br, 0·039—0·161; I, 0·070—0·157; Na₂O, 8·50—16·25, and K₂O, 10·80—18·20 per cent. L. DE K.

Experiments at Grignon. By PIERRE P. DEHÉRAIN (*Ann. Agron.*, 1900, 26, 369—383. Compare this vol., ii, 303).—Field experiments with varieties of potatoes, and smaller experiments on the effect on potatoes of green manuring with vetches are described.

Mangolds. The object of these experiments, which were made in large boxes of 4 cubic m. capacity was to ascertain the effect of irrigation on the growth of mangolds. No. 1 was manured with vetches and was not watered; No. 2 had no green manure, but was watered; and No. 3 was manured with vetches and was watered. The yield of dry matter, sugar, and nitrogen was considerably greater in 2 than in 1;

in 3 rather more dry matter and nitrogen and rather less sugar were obtained than in 2. The results apply only to a good soil resting on an impermeable and inclined subsoil.

Sainfoin and Lucerne. When sainfoin and lucerne are sown together at Grignon, the sainfoin predominates during the first two years, and then disappears. In 1897, several plots were sown with the mixed seed; no manure was applied. In 1899, gramineous herbage appeared on the plots, and a variety of manures were applied. The manures had very little effect on the yield, but whilst the herbage from the sodium nitrate plot contained 18.5 per cent. of *Gramineæ*, the hay manured with potash and superphosphate contained only 15.5 per cent. In 1900, there was so much inferior grass that the experiment was discontinued.

It is thought possible that the failure may be due to the vigorous growth of sainfoin having weakened the lucerne, and rendered it incapable of resisting the encroachment of the grasses, but it is also possible that leguminous crops have been grown too long.

N. H. J. M.

Value of Molasses as Food. By PAUL HOPPE (*Zeit. Ver. Deut. Zuckerind.*, 1900, 535, 713—762).—It is of importance to ascertain the nature of the molasses employed as food; acid molasses should be rejected.

In experiments with cows, it was found that large amounts of molasses, 5 kilos. per day, did not interfere with digestion, and had no purgative action. It is thought that the purging sometimes observed by others is not only, or mainly, due to the salts present in the molasses, but to the saccharates.

In the cases of cows recently calved, molasses acted only on the production of milk; during gestation, however, molasses was favourable both as regards milk production and in increasing the live weight.

Whilst molasses increased the yield of milk, the percentage of fat was distinctly diminished when large amounts of molasses were employed; the percentage of nitrogen remained unaltered, and the acidity was increased. Molasses had no effect on the butter.

Dried molasses is preferable to liquid molasses, and forms a good substitute for mangolds. The dried substance is not only very favourable to milk production, but also increases the live weight.

N. H. J. M.

Blood Molasses. By FRIEDRICH STROHMER (*Chem. Centr.*, 1900, ii, 135—136; from *Oesterr.-ung. Zeit. Zucker-Ind. Landw.*, 29, 161—172).—The food is prepared by drying and sterilising a mixture of blood (4 parts) and molasses (1 part) with bran or brewers' grains. According to Maercker, 95.9 per cent. of the proteids is digestible. Satisfactory results of feeding experiments with blood molasses were obtained by Ramm and Mintrop (*Milch-Zeit.*, 27, 519, and this vol., ii, 39) and by Lilienthal (this vol., ii, 502).

As regards the amount of blood available, it is stated that the Vienna slaughter-houses furnished 6,000,000 kilos. in one year.

N. H. J. M.

Feeding Pigs with Blood Molasses. By LILIENTHAL (*Bied. Centr.*, 1900, 29, 526—527; from *Deut. Landw. Presse*, 1899, 74; compare this vol., ii, 502).—The results of experiments with pigs showed that there was at first an increase in weight due to feeding with blood molasses, but that finally the weights were considerably less than with maize and barley (in addition to skim-milk and roots). The molasses did not interfere with the health of the pigs, but injured the quality of the meat; the fat was watery, and some of it of a spongy texture.

It is thought that it may be possible to prepare a food suitable for pigs from blood molasses. N. H. J. M.

Peat-meal Molasses. By RUDOLF Woy (*Chem. Centr.*, 1900, ii, 284; from *Zeit. öffent. Chem.*, 6, 201—204).—Whilst peat-meal shows a slightly acid reaction, the addition of alkaline molasses renders it strongly acid, without, however, affecting essentially the amount of alkali required to neutralise it. During prolonged storage, the sugar becomes inverted by the acid of the peat unless this is rendered neutral.

The amount of sugar present is determined as follows. The food (16.5 grams) is extracted on a funnel with boiling water, the solution treated with lead acetate when cold, and diluted to 300 c.c. Two hundred c.c. of the filtered solution are freed from lead by means of sodium phosphate solution (20 c.c.), and 50 c.c. inverted by heating for 20 minutes in water heated to 67—70° with 5 c.c. of 20 per cent. hydrochloric acid. The inverted solution is then diluted to 250 c.c., of which 50 c.c. is employed for determining the sugar by Kjeldahl's method. The invert sugar (in cg. from Kjeldahl's tables) doubled and multiplied by 0.95 gives the percentage of cane sugar in the food. Assuming the molasses to contain 48 per cent. of cane sugar, the relation of peat to molasses can be ascertained sufficiently exactly.

In the above method, the raffinose will be included in the results as cane sugar. This is, however, of no practical importance, as raffinose is presumably as readily digested as cane sugar.

A polarimetric method for determining the sugar is described, but as a rule the gravimetric method is preferable. N. H. J. M.

Feeding Experiments with Crushed Palm Kernels. By PAUL VIETH (*Chem. Centr.*, 1900, ii, 136—137; from *Milch. Zeit.*, 1900, 294—295).—Six cows were fed with straw, hay, chaff, dried brewers' grains (1000 grams), rape cake (250 grams), peat molasses (500 grams), maize gluten meal (250 grams), and stored beetroot sections (20 kilograms) per head per day. In addition, the cows received either crushed palm kernels (2 kilos.) or cotton-seed meal (0.5) and wheat bean (1.5 kilograms). Although the palm kernels gave only slightly better results as regards the yield of milk, fat, and total dry matter, its employment is strongly recommended owing to its less cost.

N. H. J. M.

Composition of Various Kinds of Peat. By BRUNO TACKE and BERNHARD TOLLENS (*Bied. Centr.*, 1900, 29, 508—509; from *J. Landw.*, 1898, 46, 341. Compare H. von Feilitzen, *ibid.*, 46, 9).—The

samples of peat were of German, Hungarian, and Russian origin, and contained from 54.5 to 57 per cent. of carbon, with the exception of one which contained 64.32 per cent. (in the substance free from ash). The amounts of ash, organic matter, carbon, hydrogen, nitrogen, and oxygen in all the samples are given. The percentage of nitrogen in organic matter varied from 3.96 to 6.86 per cent. N. H. J. M.

Composition of Drainage from Unmanured and Manured Peat Soil, with special reference to Nitrogen Compounds. By BRUNO TACKE, HEINRICH IMMENDORFF, and H. MINNSEN (*Bied. Centr.*, 1900, 29, 505—508; from *Landw. Jahrb.*, 1898, *Erg.-bd.*, iv, 349).—The peaty soil, contained in pots, was manured with lime, and with lime, kainite, and basic slag both with and without addition of sodium nitrate; there were also check experiments without manure.

It was found that a portion of the organic nitrogenous matter of peat is readily decomposed, with production of ammonia and nitrates; most of the nitrogenous matter is, however, very stable, and its decomposition is not promoted by the normal amount of lime as this does not completely neutralise the acidity of the soil. Large amounts of lime promote nitrification considerably. Manuring with lime, kainite, and phosphate does not appreciably increase the amount of ammonia in the drainage, but there was a distinct increase in ammonia when sodium nitrate was applied in addition to the mineral manures.

Both the pre-existing phosphoric acid and that applied as manure are retained by peat with considerable tenacity, but when phosphates are applied continuously the retentive power of the soil seems to diminish.

With regard to potash, magnesia, and lime, small portions of these constituents present in natural peat-land are relatively readily soluble in water; the greater portion is, however, sparingly soluble. Much of the potash applied as manure is liable to loss in drainage, whilst the rest is retained by the soil.

Manuring with potash increases the solubility of the lime very considerably. N. H. J. M.

Changes in the Weights of Artificial Manures when Exposed to Air. By L. VON WISSELL (*Chem. Centr.*, 1900, ii, 282—283; from *J. Landw.*, 48, 116—121).—Fifty grams of each manure were exposed to the air in flat dishes covered with perforated paper. Basic slag changed very little, notwithstanding the free lime which it contains, the maximum gain being 0.6 per cent. Superphosphate showed, according to the temperature and condition of the atmosphere, the maximum loss and gain of -3.7 and +9.3 per cent. Kainite and sodium nitrate lost in weight in warm, dry weather, but in damp air the weight increased by as much as 31 and 11.1 per cent. respectively. One sample of ammonium sulphate gained 5 per cent. in weight, whilst a second sample was only slightly hygroscopic.

N. H. J. M.

Manurial Experiments with Green and Dead Plants and Parts of Plants. By EWALD WOLLNY (*Bied. Centr.*, 1900, 29, 509—523; from *Vierteljahresschr. Bay. Landw.-rat.*, 1897, Heft. 3 and 4).—In the case of soils poor in humus and nitrogen, green manuring

with leguminous plants, supplemented with potash, phosphates, and lime, is far more effective than when non-leguminous plants are employed. On highly nitrogenous soils, the effect of manuring with leguminous plants is the same as with non-leguminous. The ploughing in of plants on the land where they were grown is less effective than when the crop is removed to fallow land. Manuring with straw had a relatively slight effect. Pea and bean straw gave, on the whole, better results than rye and rape straw.

The application of peat was, as a rule, very beneficial. Sandy soil, when manured with peat, retained more water, whilst loam was rendered more porous.

Experiments are described in which winter rye was grown on plots from which the residues of the previous crops had been removed, and on plots containing the residues. The results showed that the removal of the crop residues diminished the yield. The most valuable crop residues are those of clovers, then those of root-crops and potatoes, and last, the stubble and roots of cereals.

N. H. J. M.

Influence of Bacteria on the Decomposition of Bones. By JULIUS STOKLASA, F. DUCHÁČEK, and J. PITRA (*Zeit. Zuckerind. Böhm.*, 1900, 24, 627—645).—Sifted bone meal (in quantities of 10 grams) with water (900 c.c.), potassium sulphate (0.1 gram), magnesium chloride (0.05 gram), and ferric sulphate (0.01 gram) was sterilised, and then inoculated with various bacteria. The following percentage amounts of nitrogen in different forms, and of dissolved phosphoric acid (per cent. of total) were found at the end of the experiment, which lasted 33 days.

	Amide nitrogen.	Diamine nitrogen.	Monamine nitrogen.	P ₂ O ₅ , in solution.
Not inoculated.....	4.33	28.72	61.51	3.83
<i>Bacillus megatherium</i> (alinit) ...	61.04	20.48	14.05	21.56
„ <i>fluorescens liquefaciens</i>	22.60	56.80	15.40	9.19
„ <i>proteus vulgaris</i>	43.57	29.62	28.54	14.79
„ <i>butyricus</i> , Hueppe.....	45.85	14.42	35.57	15.55
„ <i>mycoides</i>	62.15	8.62	25.05	23.03
„ <i>mesentericus vulgatus</i> ...	63.05	40.96	—	20.60

Vegetation experiments are described in which oats grown in large pots were manured with bone meal and inoculated with the different bacteria. Dextrose was applied to the inoculated pots. The results accord with those described above. In the case of *B. megatherium*, one pot was without dextrose. Whilst in this case the yield of oats was far greater than without inoculation, the addition of dextrose gave rise to a further increase. Xylose, in the place of dextrose, produced a still greater increase in the pot inoculated with *B. megatherium*.

The soil employed for these experiments was not sterilised before being inoculated.

N. H. J. M.

Infected Phosphates. By HUGO BORNTÄGKE (*Chem. Centr.*, 1900, ii, 283; from *Oesterr. Chem. Zeit.*, 3, 235).—A sample of ammonium phosphate acquired an intense odour of putrid urine, whilst potassium phosphate became covered with red and blue algae. As superphosphates

may become similarly infected, it is proposed to add to them free humic acid, from peat, or else Cassel brown or lignite. In this manner, both infection and the production of insoluble phosphoric acid would be prevented.

N. H. J. M.

Analytical Chemistry.

Employment of Floats in Burettes. By KREITLING (*Zeit. angew. Chem.*, 1900, 829—836).—A lengthy investigation as to the use of floats in burettes. The results are given in tabular form. The conclusion reached is that their use should be avoided.

L. DE K.

[**Electrometric Estimation of Iodine**]. By F. CROGINO (*Zeit. anorg. Chem.*, 1900, 24, 225—262).—See this vol., ii, 642.

Detection of Iodic Acid in the Presence of Chloric Acid, Bromic Acid, Perchloric Acid, and Periodic Acid by means of Morphine Sulphate. By C. REICHARD (*Chem. Zeit.*, 1900, 24, 644—646).—Potassium iodate may be recognised in the presence of potassium bromate and perchlorate by adding some morphine sulphate and a little sulphuric acid, when a brown precipitate, or according to the amount of dilution, a brown, yellowish-brown, or yellow coloration is produced; the reaction may be obtained at still greater dilutions by adding some ammonia at the beginning of the reaction, but the coloration then takes some time to develop. If potassium periodate is present, it may be isolated by treating the mixture with a little cold water, in which it is practically insoluble. Potassium periodate also gives a similar but less marked reaction with morphine sulphate.

The reaction is interfered with by the presence of arsenious and sulphurous acids.

L. DE K.

Apparatus for the Determination of Ammonia in Water by the Wanklyn Method, and Total Nitrogen by the Kjeldahl Method. By ROBERT SPURR WESTON (*J. Amer. Chem. Soc.*, 1900, 22, 468—473).—A detailed description of a modified form of distillation apparatus suitable for cases where a large number of estimations are carried on at the same time. The point aimed at is that the distilling flasks, burners, and receivers are all at the front of the apparatus and so readily accessible. For details, the drawings in the original must be consulted.

E. G.

Comparative Estimations of Nitrogen in Saltpetre. By L. VON WISSEL (*Chem. Centr.*, 1900, ii, 212; from *J. Landw.*, 48, 105—115).—The author has investigated Möckern's process (reduction of nitrates with zinc and iron powder in an alkaline solution), Ulsch's process (reduction with reduced iron and sulphuric acid), Forster's process (reduction with sulphosalicylic acid and sodium thiosulphate), and Devarda's process (reduction with aluminium-zinc-copper).

The last is, in the author's opinion, the most accurate and rapid ; the following proportions are recommended : 50 c.c. of the solution of nitrate (0.5 gram solid), 120—145 c.c. of water, 7.5—9 c.c. of alcohol, 75—90 c.c. of aqueous potassium hydroxide (sp. gr. 1.3) or 75 c.c. of aqueous sodium hydroxide (sp. gr. 1.34) and 3.5—4.5 grams of aluminium-copper-zinc alloy.

L. DE K.

Gasometric Method of Estimating Nitrites in Presence of Nitrates or other Soluble Salts. By J. GAILHAT (*J. Pharm.*, 1900, [vi], 12, 9—12).—All air is initially expelled by boiling from the flask of a Schlössing's apparatus for estimating nitrates, two-thirds filled with concentrated aqueous ammonium chloride ; 10 c.c. of the solution to be titrated, containing from 5—10 grams of nitrite per litre, are then gradually added, and the nitrogen evolved quantitatively according to the equation $\text{NH}_4\text{Cl} + \text{M}'\text{NO}_2 = \text{N}_2 + 2\text{H}_2\text{O} + \text{M}'\text{Cl}$, measured in a graduated tube completely immersed in cold water. Experiments are cited showing the degree of accuracy of the method.

W. A. D.

Iodometric Estimation of Arsenic Acid. By FRANK A. GOOCH and JULIA C. MORRIS (*Amer. J. Sci.*, 1900, 10, 151—157).—Williamson's process, namely, liberating iodine by adding potassium iodide and a sufficiency of hydrochloric acid to a weak solution of the arsenate and titrating with sodium thiosulphate, suffers from some sources of error. Owing to the large amount of acid, there is a danger of iodine being liberated from the potassium iodide by the action of the air and the acid may also cause partial decomposition of the thiosulphate ; these two errors somewhat compensate one another. Then again, starch cannot be used as indicator in the presence of strong acid. After being bleached, the liquid may be neutralised with potassium carbonate (not hydroxide), excess of potassium hydrogen carbonate added, and the arsenious acid titrated as usual with iodine. When using Williamson's process, it must be remembered that should there be a deficiency of acid the reaction becomes reversible.

Although the authors have proved by a series of experiments that the process may be improved by deducting 0.0030 gram of arsenic acid when using the direct titration with thiosulphate, and 0.0015 gram when titrating the alkaline liquid with iodine, they still prefer the method proposed by Gooch and Browning (*Abstr.*, 1891, 244). In this process, the arsenic acid is reduced by boiling with dilute sulphuric acid and potassium iodide, the last trace of free iodine is bleached with sulphurous acid, and the cold and neutralised liquid is then titrated as usual with standard iodine.

L. DE K.

Process for the Estimation of Carbon Dioxide in Carbonates. By R. E. DIVINE (*J. Amer. Chem. Soc.*, 1900, 22, 473—476).—An account is given of a simple and accurate method in which the carbon dioxide is liberated by means of sulphuric or tartaric acid and absorbed by solution of barium hydroxide, the excess of which is determined by titration with standard hydrochloric acid. The apparatus is fully described with the aid of a diagram.

E. G.

Detection of Metals by the Absorption Spectra of their Compounds with Alkanna. By JULIUS FORMÁNEK (*Zeit. anal. Chem.*, 1900, 39, 409—434).—The neutral chlorides and nitrates of the following metals give more or less characteristic absorption spectra with an alcoholic extract of alkanna root, to which a trace of ammonia is added: iron, caesium, potassium, rubidium, sodium, cobalt, barium, strontium, lithium, nickel, manganese, calcium, magnesium, zinc, copper, and aluminium; and without addition of ammonia: iron, uranium, nickel, copper, aluminium, and beryllium. The remaining metals produce no alteration of the alkanna spectrum. A single flint glass prism of 60° should be used in order that the spectrum may not be too much extended.

The extract of alkanna root with 95 per cent. alcohol should be of such concentration that its own absorption bands are well defined. To 5 c.c. of this extract, in a test-tube of 10—12 mm. diameter, a few drops of the metallic solution are added, and after observing the spectrum, a trace of dilute ammonia, but not enough to produce a precipitate, is added. In the case of the alkali metals, the bands disappear after a time; those of the alkaline earths gradually shift towards the red; with aluminium, the development of the bands requires time. When two metals are present, it sometimes happens that the bands peculiar to each are not simultaneously present, but new bands of intermediate position are produced. In other cases, the presence of one metal will completely suppress the spectrum due to another.

M. J. S.

Estimation of Total and Free Alkali and Alkali Carbonate in Soaps. By ROBERT HENRIQUES and OTTO MAYER (*Zeit. angew. Chem.*, 1900, 785—788).—Five to ten grams of soap are dissolved in 100 c.c. of water contained in an Erlenmeyer flask. When cold, the flask is closed with a treble-perforated cork through the centre of which passes a separating funnel; through one of the other holes passes a bent tube reaching to the bottom of the flask and connected at the other end with a wash bottle containing aqueous sodium hydroxide, and through the third hole passes a bent tube connected with a drying bottle containing sulphuric acid, a tube containing calcium chloride and a weighed potash bulb apparatus; the last is then connected with an aspirator.

A known volume of $N/2$ hydrochloric acid is introduced into the flask, the funnel is slightly rinsed, and the aspirator is set in action. Gentle heat is now applied so that the soap is fully decomposed in about half or three-quarters of an hour, and the air current is then kept up for about another hour when the bulb-apparatus is weighed. From the carbon dioxide thus found, the amount of alkali carbonate is calculated.

The liquid in the flask is heated, and the fatty acids are filtered off and washed with boiling water until free from acidity; the filtrate is then titrated with $N/2$ alkali. The fatty acids are dissolved in boiling alcohol, the filter is thoroughly washed, and the filtrate also titrated with $N/2$, preferably alcoholic, alkali; as a check, the solution may be evaporated to dryness and the pure soap weighed. From these results, the amounts of total and free alkali are readily calculated. The process

becomes a little more complicated when the fats employed in the manufacture of the soap contain soluble fatty acids. In this case, the total fatty acids of the sample must be estimated by decomposing the soap with dilute hydrochloric acid in the presence of ether. After carefully washing the ethereal solution with a little cold water, it is titrated with $N/2$ alcoholic alkali. L. DE K.

Method for the Rapid Gravimetric Estimation of Calcium. By WILLIAM H. HESS (*J. Amer. Chem. Soc.*, 1900, 22, 477—478).—The following method for the estimation of calcium, in which it is weighed as sulphate, is both rapid and accurate. Calcium oxalate is precipitated in the usual way and ignited; the residue of lime is treated with about its own bulk of dry ammonium nitrate and about twice as much fused ammonium sulphate, and gradually heated until fumes of ammonium salts cease to be driven off. By this means, the whole of the lime is converted into calcium sulphate. E. G.

Titration of Zinc with Potassium Ferrocyanide. By EDMUND H. MILLER and E. J. HALL (*Chem. Centr.*, 1900, ii, 146—147; from *School of Mines Quarterly*, 21, 267—272).—When titrating zinc in hydrochloric acid solution with potassium ferrocyanide, using uranium acetate as indicator, the liquid should not contain calcium chloride or aluminium sulphate; magnesium sulphate, although interfering with the titration in an ammoniacal solution, does not affect it in an acid liquid. Traces of lead do not interfere, provided there is a sufficiency of free acid, but it has been found that a large excess of acid is in itself a source of error. Ammonium chloride should also be absent, as it dissolves some zinc ferrocyanide. Traces of bismuth do not interfere, but antimonious chloride does so appreciably. L. DE K.

Electrolytic Estimation of Cadmium. By DMITRI BALACHOWSKI (*Compt. rend.*, 1900, 131, 384—387).—All previously described methods of precipitating cadmium electrolytically are too slow and give a too loosely adherent deposit to be of use in analysis; the necessary details are now given for the quantitative deposition of the metal. Aqueous solutions of the sulphate are used containing either acetic acid, urea, formaldehyde, or acetaldehyde. W. A. D.

Action of Sodium Thiosulphate on Lead Salts. By FRANZ FAKTOR (*Chem. Centr.*, 1900, ii, 239—240; from *Pharm. Post*, 33, 355).—A boiling concentrated solution of sodium thiosulphate added to a boiling solution of lead nitrate produces a white precipitate which does not become black on prolonged boiling. When the lead has been converted into chloride by means of sodium chloride, the precipitate becomes partly converted into sulphide on prolonged heating. If, however, ammonium chloride is used instead of the sodium salt, sodium thiosulphate produces at once a precipitate of heavy, black lead sulphide. L. DE K.

Analyses of Lead and Tin Ores, also of the most important Lead and Tin Preparations and their Commercial Products. By H. MENNICKE (*Chem. Centr.*, 1900, ii, 287—288; from *Zeit. öffentl. Chem.*, 6, 190—194, 204—213).—The author treats the lead or tin

compound with hot, dilute hydrochloric acid and metallic zinc, best in the presence of platinum. The metallic lead is washed with dilute hydrochloric acid, then with alcohol, and after being dried in a current of coal gas, is weighed. The metallic tin may be weighed as such, or it may be redissolved in strong hydrochloric acid in a current of carbon dioxide, and titrated with the usual precautions with potassium permanganate. About 2 milligrams of metallic tin escape the action of the zinc and should be allowed for.

L. DE K.

Analysis of Phosphor-copper. By HUGO BORNTÄGER (*Zeit. anal. Chem.*, 1900, 39, 360).—Half a gram of the substance is dissolved in 10 c.c. of nitric acid of sp. gr. 1.4, the solution is made strongly alkaline with ammonia, and filtered from carbon, ferric oxide, and silica. The copper in the filtrate is thrown down by ammonium sulphide and ignited by Rose's method. In the filtrate from the copper sulphide, the phosphoric acid is precipitated by magnesia mixture after concentrating.

M. J. S.

Titration of Mercury by Sodium Thiosulphate. By JOHN T. NORTON, jun. (*Amer. J. Sci.*, 1900, 10, 48—54).—Scherer has proposed a process for the volumetric estimation of mercurous nitrate, mercuric nitrate, or mercuric chloride by direct titration with sodium thiosulphate without the aid of an indicator. The author states that the process breaks down with mercurous or mercuric nitrates, but, with a slight modification, accurate results may be obtained with mercuric chloride when the amount of this does not exceed 0.1 gram.

The solution is placed in a litre flask, diluted to 100 c.c., and heated to 60°. *N/20* solution of sodium thiosulphate is now added from a burette until the white precipitate turns slightly brown. The liquid is diluted with cold water, a little asbestos fibre added, and the whole well shaken and poured on to an asbestos filter placed on a perforated platinum cone which is fixed in a glass funnel by means of a rubber connection; the funnel passes through the stopper of a large, side-necked Erlenmeyer flask connected with an exhaust pump. After carefully washing the precipitate, the filtrate is mixed with 3 grams of potassium iodide, and the excess of thiosulphate estimated as usual by means of *N/20* iodine. One c.c. of *N/20* sodium thiosulphate represents 0.015 gram of metallic mercury.

L. DE K.

Simple and Accurate Method for the Estimation of Mercury in Urine. By P. FARUP (*Chem. Centr.*, 1900, ii, 213—214; from *Arch. exp. Path. Pharm.*, 44, 272—277).—About 1 litre of urine is mixed with 3—4 c.c. of hydrochloric acid, heated in a water-bath to 70—80°, and shaken for 2 minutes with 6 grams of zinc dust. When cold, this is collected on a filter of silky asbestos. This is then put back into the flask and treated with hydrochloric acid and potassium chlorate. In this solution, the mercury is precipitated by stannous chloride, collected on gold-asbestos, and weighed.

L. DE K.

Estimation of Mercury in Urine. By J. WERDER (*Zeit. anal. Chem.*, 1900, 39, 358—359).—The method published by Schumacher and Jung (this vol., ii, 247) is incomplete, inasmuch as no confirmation is furnished that the loss of weight suffered by the gold asbestos

when ignited is really due to the presence of mercury. This proof can be supplied by connecting the asbestos filter tube containing the amalgamated gold with a bulb tube through which a current of air is aspirated. The connection is made by a plug of asbestos, and, by suitably heating, the mercury expelled is collected in the bulb, where it can be identified by aspirating over it the vapour of iodine which converts it into the red iodide.

M. J. S.

Examination of Aluminium and Zinc by Solution in Hydrochloric Acid. By F. BALDY (*Chem. Centr.*, 1900, ii, 238—239; from *Ann. Chim. anal. appl.*, 5, 201—205).—The metal (0.5—1 gram) is placed in a flask with 40 c.c. of water, and then dissolved by adding 10 c.c. of a mixture of 4 volumes of hydrochloric acid of sp. gr. 1.02 with 1 volume of nitric acid of sp. gr. 1.334. The gases evolved, after passing through a condenser, are freed from hydrochloric acid by means of ferrous sulphate, the carbon dioxide then absorbed by means of calcium succinate and estimated by titration. The metals are precipitated from a portion of the acid solution by sodium hydroxide and in the filtrate the sulphuric acid is estimated, whilst another portion of the solution is used for the estimation of phosphorus and arsenic.

The aluminium is separated from the iron by potassium hydroxide and determined as phosphate. In the case of zinc, the iron and lead are precipitated by ammonia, and the zinc and cadmium separated by potassium hydroxide.

E. W. W.

Volumetric Estimation of Manganese in Pig-iron, Cast-iron, and Steel. By ANDRÉ MIGNOT (*Chem. Centr.*, 1900, ii, 65—66; from *Ann. Chim. anal. appl.*, 5, 172—177).—The sample is dissolved in 25 times its weight of nitric acid of sp. gr. 1.2, heated to boiling, diluted with water and mixed with three times its weight of bismuth tetroxide. The pink solution is then filtered through asbestos, and the permanganic acid titrated with hydrogen peroxide. The process is not applicable in the presence of chromium if this exceeds 1 per cent.

Bismuth tetroxide is prepared by fusing in an iron dish equal parts of bismuth subnitrate and potassium chlorate with 2 parts of sodium hydroxide; the mass is then extracted with water to remove the alkali and dried.

L. DE K.

Precipitation of the Sulphides of Nickel and Cobalt in an Alkaline Tartrate Solution. By OLIN F. TOWER (*J. Amer. Chem. Soc.*, 1900, 22, 501—521).—In employing the method suggested by Villiers (*Abstr.*, 1895, ii, 228, 247) for the qualitative separation of nickel and cobalt, it is found that the oxidation of the solution to which the hydrogen sulphide has been added results in the separation of so much sulphur that, if nickel is present and cobalt absent, the black solution will colour the sulphur, making it very difficult to distinguish it from precipitated cobalt sulphide; it is also observed that the sodium chloride present in the solution may cause some nickel sulphide to be precipitated which may be easily mistaken for cobalt sulphide. Experiments are described which show that nickel sulphide in solution in an alkaline tartrate is in the colloidal state.

E. G.

Action of Sodium Thiosulphate on Certain Metallic Salts, and its Employment in Quantitative Analysis. By FRANZ FAKTOR (*Zeit. anal. Chem.*, 1900, 39, 345—354).—Under certain conditions, sodium thiosulphate can be used for the estimation of the chromium in chromates and chromic salts. From a solution of potassium chromate or dichromate, to which ammonium chloride or magnesium chloride is added, the whole of the chromium is precipitated as chromium chromate (mixed with sulphur) by boiling with an excess of sodium thiosulphate. The precipitate is converted into pure chromic oxide by ignition. From chromic chloride, the whole of the chromium is not precipitated unless a small quantity of a chromate is also present.

Lead chloride or lead nitrate mixed with ammonium chloride (but not if sodium chloride is substituted) readily yields the whole of its lead as sulphide when heated with an excess of thiosulphate. Silver nitrate also yields all its silver as sulphide when warmed with sodium thiosulphate. Nickel and cobalt yield sulphides, but the precipitation is in neither case complete. M. J. S.

Volumetric Estimation of Chromic Acid by Arsenious Acid in an Alkaline Solution. By C. REICHARD (*Chem. Zeit.*, 1900, 24, 563—564).—A known weight of pure arsenious oxide is dissolved in 10 per cent. aqueous sodium hydroxide and the exact strength of the solution is ascertained by titrating with either standard iodine or standard permanganate.

The chromate to be analysed is boiled for some time with a known volume of the alkaline arsenious oxide solution; this causes the separation of some of the chromium hydroxide, which is removed by filtration through a sieve-like porcelain funnel. The filtrate is then nearly neutralised with dilute hydrochloric acid, excess of sodium hydrogen carbonate is added, and the excess of arsenious acid estimated as usual by means of iodine.

To avoid the filtration, the liquid may be mixed with excess of dilute sulphuric acid, any undissolved chromium hydroxide washed by decantation, and the excess of arsenious acid titrated with standard potassium permanganate. The test-analyses are satisfactory.

L. DE K.

Estimation of Molybdenum in Iron. By E. DÖHLER (*Chem. Zeit.*, 1900, 24, 537).—The sample is dissolved in nitric acid and the solution evaporated to dryness to render silica insoluble. The mass is then treated with strong hydrochloric acid and boiled down to a small volume. After diluting with water and filtering, the liquid is heated to 80° and saturated with hydrogen sulphide; after 12 hours, the precipitate is collected, well washed with water containing hydrogen sulphide and a few drops of hydrochloric acid, and then digested with ammonium sulphide. Any insoluble matter is freed from traces of molybdenum by fusing it in a porcelain crucible with sodium potassium carbonate and sulphur; the mass is treated with water and the filtrate added to the ammonium sulphide solution. The liquid is now heated and acidified with hydrochloric acid, which causes the precipitation of molybdenum sulphide and free sulphur. The pre-

precipitate is collected on a weighed filter, thoroughly washed with hot water, dried at 120°, and weighed. The mass is then detached from the filter, well mixed in an agate mortar, and an aliquot part is placed in a weighed boat and heated in a current of hydrogen; the molybdenum disulphide so obtained is then weighed

L. DE K.

Rapid Assay of Tungsten Ores and Residues. By HUGO BORNTÄGER (*Zeit. anal. Chem.*, 1900, 39, 361—362).—Wolframite, the most common tungsten ore, contains as impurities sand, calcium, magnesium, antimony, arsenic, tin, lead, cobalt, nickel, copper, and traces of gold, with occasionally molybdenite. A gram of the finely powdered mineral is fused for an hour with 10 grams of sodium carbonate, the mass exhausted with water, and the residue ignited and weighed. By deducting this residue from 100, the percentage of tungstic acid is obtained within 5 per cent., which for rough assays is sufficiently close. For more accurate work, the aqueous extract is made up to 250 c.c., and 100 c.c. is delivered into a mixture of 15 c.c. of concentrated nitric acid and 45 c.c. of concentrated hydrochloric acid. The mixture is evaporated to dryness and extracted with a liquid containing 100 grams of ammonium chloride, 100 grams of strong hydrochloric acid, and 1000 grams of water. The insoluble matter, which contains the tungstic acid with silica and stannic oxide, is dissolved in ammonia, the solution poured into a similar acid mixture, and this liquid evaporated to dryness. The residue, washed as before, is ignited and weighed as tungstic acid. Metallic tungsten and its alloys with copper, iron, nickel, &c., should be roasted for half an hour before fusing as above, and a little nitre added to the soda.

M. J. S.

Action of Sodium Thiosulphate on Bismuthic, Ferrous, and Ferric Salts. By FRANZ FAKTOR (*Chem. Centr.*, 1900, ii, 20—21, 67; from *Pharm. Post*, 33, 301, 317).—Neutral aqueous solutions of bismuthic salts are quantitatively precipitated as trisulphide by sodium thiosulphate (? on boiling). To obtain trustworthy results in estimating bismuth by this method, the trisulphide should be moderately ignited in a current of hydrogen sulphide.

Neutral solutions of ferric salts are first coloured violet by sodium thiosulphate, but gradually assume a yellow or brownish-yellow colour, which is not altered on prolonged boiling. If, however, a little ammonia is added, a greenish-black precipitate is formed, which on continued boiling yields blackish-brown, granular, ferrous hydroxide (? ferrosiferic hydroxide). The precipitation does not seem to be complete.

Solutions of ferrous salts are not precipitated on boiling with sodium thiosulphate unless ammonium chloride and ammonia are added. The iron then gradually separates as sulphide.

L. DE K.

Electrolytic Precipitation of Antimony from its Sulpho-salt with the Application of a Diaphragm. By HERMANN OST and W. KLAPPROTH (*Zeit. angew. Chem.*, 1900, 827—829).—The authors have made an attempt to improve the electrolytic method

for the estimation of antimony by the introduction of a diaphragm in order to prevent the solution of the metal in the accumulating polysulphide.

The apparatus was composed of a Classen's platinum dish in which was suspended a basin-like diaphragm made of porous porcelain; a platinum disc in the diaphragm cell was made the anode, and the dish the cathode, and both dishes were covered with cut-out watch glasses. The experiments were made with a solution of "Schlippe's salt" containing 0.0985 gram of antimony per 10 c.c., and a solution of pure sodium sulphide containing 195 grams of this salt, equal to 200 grams of pure sodium hydroxide per litre; 10 c.c. of the antimony solution were mixed with varying amounts of sodium sulphide and then diluted to 125 c.c.

When the antimony is introduced in both anode and cathode, it is only completely precipitated in the latter; if introduced in the latter only, it is completely removed from the liquid. If introduced in the anode only, not a trace of metal is deposited at the cathode, but antimony sulphide is formed at the anode.

The completeness of the precipitation in the cathode depends slightly on the amount of sodium sulphide. If this is present in excess and when, consequently, the tension is low, all the antimony is precipitated, but in the presence of but little sodium sulphide and a high tension, a small portion of the antimony passes through the diaphragm, and is precipitated as sulphide on the anode. The metal, however, never passes from the anode to the cathode.

The other products of the electrolysis, both in the anode and cathode space, were investigated with the aid of Wehrlin's decomposition cell. The gas collecting in the cathode was proved to consist of practically pure hydrogen. At the anode, oxygen is formed, but this rarely escapes as gas, as it is at once absorbed by the sodium sulphide, forming sodium polysulphide and sodium thiosulphate.

It remains to be seen whether the use of the diaphragm is to be recommended. It presents no difficulties with antimony alone, but in the presence of tin the tension should not exceed 1 volt.

L. DE K.

Improved Absorption Apparatus for Use in the Analysis of Essential Oils. By ALFRED C. CHAPMAN and HERBERT E. BURGESS (*Analyst*, 1900, 25, 197—199).—The apparatus consists of a 250 c.c. flask with a long, narrow neck and a tubulure at the bottom through which passes a bent glass tube connected by a long piece of india-rubber to a funnel. Communication between these may be closed or established by means of a pinch-cock.

Twenty-five c.c. of the essential oil are introduced into the flask, the temperature being carefully noted. After adding a sufficiency of the absorbent, the mixture is thoroughly shaken, and the aqueous layer removed by opening the pinch-cock. A fresh quantity of absorbent may now be added, or the residual oil may be washed with either hot or cold water.

To the flask is now attached a ground, specially-constructed measuring

tube, the character of which depends on particular circumstances ; it may be surrounded by a water jacket. By pouring water into the funnel and raising the india-rubber tubing, the oil is forced from the flask into the graduated tube, where its volume is then read off at the original temperature.

L. DE K.

Estimation of *m*-Cresol in Mixtures of Cresols. By FRITZ RASCHIG (*Zeit. angew. Chem.*, 1900, 759—761).—Ten grams of the sample are weighed in a small Erlenmeyer flask and mixed with 15 c.c. of sulphuric acid of sp. gr. 1.846. After being heated for an hour at 95—100°, the contents are poured into a wide-necked litre flask and rapidly cooled under a tap with circular motion to spread the compound over the sides of the flask. The Erlenmeyer flask is now quickly rinsed with 90 c.c. of nitric acid of sp. gr. 1.385, and this is poured all at once into the litre flask ; the whole is thoroughly shaken for not more than 20 seconds and then put into a fume chamber. After the lapse of about 1 minute, a violent action sets in with evolution of red fumes ; the clear liquid becomes turbid, oily drops of trinitro-*m*-cresol collect at the bottom, and after 5 minutes the reaction seems to be completed. After waiting 5 minutes longer, the liquid is emptied into a dish containing 40 c.c. of water and the flask is rinsed with another 40 c.c. The trinitro-*m*-cresol now solidifies to a crystalline mass, which after two hours is collected on a counterpoised filter, dried at 95—100°, and weighed. Its weight divided by 1.74 equals the amount of *m*-cresol.

The process is not applicable in the presence of large quantities of phenol.

L. DE K.

Estimation of Glycerol in Fats and Soaps. By FERDINAND JEAN (*Chem. Centr.*, 1900, ii, 293 ; from *Ann. Chim. anal. appl.*, 5, 211—213).—The author has applied Laborde's process for the estimation of glycerol, based on the isolation of its carbon by means of sulphuric acid (*Abstr.*, 1899, ii, 816), to the analysis of fats and soaps.

Ten grams of saponified fat or soap are dissolved in hot water and precipitated with zinc sulphate. The solution is mixed with 10 drops of sulphuric acid, evaporated to 2—3 c.c., and then treated with 6 c.c. of strong sulphuric acid at 150° as directed.

L. DE K.

Analysis of Saccharine Liquids. By GEORGES HALPHEN (*J. Pharm.*, 1900, [vi], 12, 12—14).—In Raczkowski's method of examining saccharine liquids (*Mon. Sci.*, 1896, 19), the potassium carbonate used for removing the excess of lead acetate gives rise to decomposition products of dextrin, which render the solution ultimately obtained highly absorptive of light, and thus unsuitable for polarimetric examination ; the author obviates this by using calcium instead of potassium carbonate, and slightly modifying the original procedure in a few other particulars.

W. A. D.

Estimation of Sugar in Beet. By JOHANN KOVÁČ (*Chem. Centr.*, 1900, ii, 148—149 ; from *Oesterr.-ung. Zeit. Zucker-Ind.*, 29, 182—209).—Three processes are in general use for the extraction

of beet for polariscopic purposes, namely, extraction with alcohol, digestion with hot alcohol of 85 per cent., and digestion with hot water.

As the result of many years' experience, the author thinks the alcoholic extraction process is the best, as fewer impurities pass into the solution.

L. DE K.

[Estimation of Sugar in] Peat-meal Molasses. By RUDOLF WOI (*Chem. Centr.*, 1900, ii, 284; from *Zeit. öffentl. Chem.*, 6, 201—204).—See this vol. ii, 682.

Polarimetric Estimation of Sugar in Wine. By XAVIER ROCQUES (*Chem. Centr.*, 1900, ii, 291; from *Ann. Chim. anal. appl.*, 5, 216—219).—When polarising wine, it is necessary to first remove the alcohol, as this rapidly diminishes the rotatory power of lævulose and slightly that of dextrose; sucrose is not affected.

Formulæ are given for calculating the amount of dextrose (x) and lævulose (y) in a litre of liquid, using the polarisation (R) in circular degrees, and the gravimetric estimation of the total reducing sugars (P).

$$x = (R + mP)/(0.106 + m), \quad y = P - x.$$

$m = a_D l/v$, in which a_D is the specific rotatory of lævulose with due regard to temperature, $l = 2$ the length of the polarising tube, $v = 1000$ the volume of the liquid; m at 10° has the value 0.1916, at 15° 0.1860, at 20° 0.1748, and at 25° 0.1692.

L. DE K.

Detection of Salicylic Acid in the Presence of Citric Acid. By OTTO LANGKOPF (*Chem. Centr.*, 1900, ii, 147—148; from *Pharm. Centr. H.*, 41, 335—337).—Salicylic acid cannot be detected in lemon juice by adding ferric chloride, as the citric acid interferes with the reaction. It may, however, be readily isolated by shaking the sample with a mixture of equal volumes of ether and light petroleum; ether alone should not be used as it slightly dissolves citric acid.

L. DE K.

A Cause of Error in Testing for Salicylic Acid in Wines. By ANTONIO J. FERREIRA DA SILVA (*Compt. rend.*, 1900, 131, 423—424).—The Petlet-Grobert method is unsatisfactory since, with samples of pure wine, it often gives a rose or reddish-violet coloration liable to be confused with that produced by salicylic acid; the German official test, however, is always trustworthy.

W. A. D.

Estimation of Uric Acid. By A. BELLOCQ (*J. Pharm.*, 1900, [vi], 12, 103—104).—To 200 c.c. of urine are added 20 c.c. of a mixture of 30 c.c. of a 1:3 solution of zinc sulphate, 30 c.c. of aqueous sodium hydroxide, and 40 c.c. of a saturated solution of sodium carbonate; complete precipitation usually occurs, a perfectly limpid liquid being obtained, but should this not happen, more of the reagent is added. The precipitate is collected, and, after draining, is easily transferred to a crucible, floating on water; 2 or 3 c.c. of hydrochloric acid saturated with uric acid are added, when crystals of uric acid rapidly separate. These are collected in a small cylindrical funnel on a wad of moistened absorbent cotton, washed with 10 c.c. of alcohol,

a second wad of cotton pressed down, and the whole transferred to a filter paper, dried, and weighed.

W. A. D.

Precipitation of Uric Acid by Barium Chloride. By ADOLF JOLLES (*Zeit. anal. Chem.*, 1900, 39, 355—357).—It was stated by Geelmuyden (*Abstr.*, 1892, 1032) that the precipitation of uric acid by barium chloride can be employed for its estimation in urine. The author admits that with pure uric acid the precipitation is fairly complete, but shows that from neutralised urine only a small fraction of the uric acid present is thrown down, whilst the precipitate contains other nitrogenous substances which Geelmuyden has mistaken for uric acid, since he confined himself to estimating the total nitrogen in the precipitate without identifying the nature of the nitrogenous substance precipitated.

M. J. S.

Composition of Milk and Milk Products. By HENRY DROOP RICHMOND (*Analyst*, 1900, 25, 225—231).—The paper contains the report on the composition of milk and allied products analysed in the laboratory of the Aylesbury Dairy Co. in 1899.

With a very few exceptions, the samples were in every respect above the legal standard; in the case of those samples which fell below 8.5 per cent. of solids not fat, it was again proved that the deficiency was solely due to lactose, and not to casein or ash.

Timpe's formula for calculating the amount of added water or of abstraction of cream, which is based on the supposed relation between proteids and fat (this vol., ii, 251), is stated to be untrustworthy and unsuitable for commercial milk-analysis.

The colour tests with *p*-phenylenediamine or *m*-phenylenediamine and amyl alcohol, proposed to distinguish between raw and heated milk, should not be implicitly depended on, and Faber's albumin test should always be applied as a check.

Analyses of butter and cream are also given; a butter prepared by an extractor supposed to increase the yield contained 20.42 per cent. of water.

L. DE K.

Umikoff's Reaction with Human Milk. By NADINA SIRBER (*Zeit. physiol. Chem.*, 1900, 30, 101—112).—Umikoff (*Trudy Wratsch. Petersburg vospitatei*, 1898) has described a reaction by which human milk can be distinguished from the milk of the cow and other vegetable feeders. If 5 c.c. of the milk are mixed with 2.5 c.c. of 10 per cent. aqueous ammonia, and the mixture kept at 60° for 15—20 minutes, a violet-red coloration is obtained. As lactation progresses, the intensity of the reaction is increased. These statements are confirmed. The substance is dialysable, and the dialysate of cow's milk gives it. The substance which gives the reaction is not lactose, as Marchetti supposed, but citric acid. Although cow's milk contains more citric acid, it also contains more calcium salts, which hinder the reaction; the dialysate contains more citric acid than calcium salts, and so gives the reaction.

W. D. H.

Composition of Danish Butter. By HARALD FABER (*Analyst*, 1900, 25, 199—201).—The samples, the analysis of which is recorded in a table, were duplicates of those taken by the Custom House offi-

cials at the port of importation every month during 1898 and 1899. The tests were limited to the determination of the Reichert-Wollny figure, the refraction in Zeiss's instrument at 45°, and the Bechi test for cotton-seed oil (margarine).

On the whole, the samples had a very high Reichert-Wollny number; in a few samples during the autumn this fell to 24.3—25.6. It has now been proved beyond dispute that the use of cotton-seed cake as cattle food may cause the butter to give a decided Bechi test, so that this does not necessarily imply any addition of margarine.

A table is given showing the average amount of water during the years 1890—1898; the highest percentage recorded is 17—18.

L. DE K.

Welmans' Phosphomolybdate Test. By P. WELMANS (*Chem. Centr.*, 1900, i, 1248—1249; from *Zeit. öffentl. Chem.*, 6, 127—134, 143—148).—This is a reply to several critics who, in the author's opinion, have not consulted his original instructions.

The reagent is prepared by dissolving 20 grams of sodium phosphomolybdate in water containing 10 c.c. of 25 per cent. nitric acid, and diluting to 100 c.c. This solution should show no sign of green, and must become perfectly colourless on adding excess of ammonia. When added to pure lard, no reduction takes place, but if the sample should contain vegetable oils in sound condition a green colour is noticed. This green is really a mixture of a blue colour with the yellow colour of the reagent, and when the reduction has been very decided, the blue colour predominates. If there has been so little reduction that no green coloration is noticed, a trace of blue may be obtained by adding excess of ammonia, but no notice should be taken of such a slight reduction. The author has already stated that the reduction is undoubtedly caused by the colouring matters contained in the oils, which may be of a glucoside-like nature.

Soltsien's statement (compare following abstract), that phosphomolybdic acid even in ammoniacal solution is reduced by aldehydes, is challenged. No doubt there are a number of substances capable of reducing the reagent, but these are not likely to be met with in practice.

L. DE K.

Welmans' Reaction for the Detection of Vegetable Oils. By PAUL SOLTSIEN (*Chem. Centr.*, 1900, ii, 289; from *Zeit. öffentl. Chem.*, 6, 187—190).—The colour produced on adding Welmans' reagent (preceding abstract) to a vegetable oil should be noticed after 5 minutes, as after some time all oils give the reaction. The author prefers to avoid the use of chloroform, and therefore melts the sample at a low temperature, and then adds a little of the reagent. After shaking for 5 minutes, excess of ammonia is added and the first change in colour noticed.

Butter-fat and horse-fat also give the reaction. The reagent is also reduced by furfuraldehyde and formaldehyde.

L. DE K.

Chemistry of Corn Oil [Maize Oil]. By HERMANN T. VULTE and HARRIET WINFIELD GIBSON (*J. Amer. Chem. Soc.*, 1900, 22, 453—467).—The physical and chemical constants of three samples of corn oil were

determined; (a) was a freshly prepared specimen of undoubted purity, (b) a commercial specimen, 6—7 years old, and (c) a product of the mash of distilleries, of a brown colour, and 10—12 years old. The results are summarised in the following tables:

Physical Constants.

	a.	b.	c.	Insoluble fat acids.
Specific gravity { 15.5°	0.9213	0.9213	0.9255	—
100°	0.8711	0.8716	0.8756	0.8529

These observations are in each case compared with those of previous workers. The results of the application of a number of colour reactions to each sample of oil are also described. E. G.

Halphen's Colour Reaction for the Identification of Cotton Seed Oil. By P. N. RAIKOW (*Chem. Zeit.*, 1900, 24, 562—563, 583—585).—It has been proved that the active principle contained in cotton seed oil which causes the Halphen sulphur reaction is not the same substance as that which gives the Bechi silver test, as when cotton seed oil is thoroughly oxidised with potassium permanganate in the presence of cold dilute sulphuric acid, the resulting product still gives the Bechi, but no longer the Halphen, test.

Exposure of the mixture of cotton seed oil and Halphen's reagent (carbon disulphide, sulphur, and amyl alcohol) to sunlight has the same effect as heating; the colour obtained is permanent in the dark but gradually fades on prolonged exposure to light. This is not caused by the action of sunlight on the active principle itself, as cotton seed oil without any admixture of either carbon disulphide

or sulphur, after being exposed to the action of sunlight for 7 months, still gives both Bechi's and Halphen's reactions.

The conclusion finally drawn is that perhaps the active principle is an unknown unsaturated fatty acid with a side chain.

L. DE K.

Sesamé Oil. By F. UTZ (*Chem. Centr.*, 1900, ii, 293—294; from *Pharm. Zig.*, 45, 490—491).—The author has tested African, Indian, and Levantine sesamé oil, and tabulated the results. The analysis was restricted to the sp. gr., melting point of the fatty acids, polarisation in 20 cm. tube at 15°, iodine number (Hübl-Waller), refraction of the oils at 25° and 40°, and refraction of the fatty acids at 25° and 40°; the results show that the oil has a fairly constant composition.

Colour reactions were also tried. When shaken with hydrochloric acid (Bishop's test), this turns green, the colour being strongest with Indian and weakest with Levantine oil. The latter emulsifies with the acid, and only separates when heated in the water-bath; the supernatant oil assumes a dark orange colour. The other oils do not form an emulsion with the acid, and do not darken so much. Baudouin's test (hydrochloric acid and furfuraldehyde) shows best with the African oil.

The most delicate reaction, however, is Soltsien's stannous chloride test, which allows the detection of 0.5 per cent. of sesamé oil in earth-nut oil. The author also confirms the results obtained by Breinl (*Abstr.*, 1899, ii, 824) as regards the substitution of other aldehydes for furfuraldehyde.

L. DE K.

Polarimetric Estimation of Camphor in Camphorated Oil. By NORMAN LEONARD and HARRY M. SMITH (*Analyst*, 1900, 25, 202—203).—The authors have examined solutions of camphor in olive oil and its substitutes in the 200 mm. tube of a Schmidt and Haensch half-shadow polariscope, using sodium light, and find that the angular rotation is raised 1° for every per cent. of camphor. As the rotation of the oil is insignificant, it follows that the polariscope is a most convenient instrument for rapidly testing the strength of the officinal camphorated oil.

The results obtained practically confirm those of Chabot (*Abstr.*, 1890, 1427) and also those of Dowzard, who stated that the angular rotation per 100 mm. multiplied by 1.962 equals the percentage of camphor. The presence of the latter does not interfere with the identification of the oil by the refractometer. L. DE K.

Influence of Dextrose on the Estimation of Urea by the Hypobromite Method. By LÉON GARNIER and LÉOPOLD MICHEL (*J. Pharm.*, 1900, [vi], 12, 53—61).—The authors justify Jacoby's statement (*Abstr.*, 1886, 104) that the addition of dextrose in the hypobromite method enhances the production of nitrogen without, however, enabling the urea to yield its full complement of gas. The dextrose is, indeed, disadvantageous, since its energetic oxidation develops heat, necessitating a delay in reading the volume of the gas, and since a small quantity of carbon dioxide is produced with the nitrogen unless a large excess of alkali be used. Moreover, the augmentation of the yield of nitrogen is not only small but indeterminate.

Quinquaud's claim (*De l'urée*, 1897, 143) to have obtained theoretical results by means of a specially concentrated hypobromite solution without employing dextrose, is shown to be fallacious; but the comparative method of estimating urea in urine as described by Yvon and by Vieillard (*Analyse des urines*) yields perfectly satisfactory results.

W. A. D.

NOTE BY ABTRACTOR.—The foregoing experiments were made with 2 per cent. solutions of urea, whereas Moreigne, in a paper apparently overlooked by the author (*Abstr.*, 1899, ii, 73), has stated that with solutions containing more than 0.5 gram in 100 c.c., an error as great as 2.5—3.0 per cent. may arise.

Detection of Foreign Colouring Matters in Preserved Tomatoes. By GEORGES HALPHEN (*Chem. Centr.*, 1900, ii, 68; from *Ann. Chim. anal. appl.*, 5, 177—179).—**Coal-tar Colours.**—The substance is mixed with sand or silica and dried; the dry mass is moistened with glacial acetic acid and then shaken with twice its volume of 90 per cent. alcohol. The filtrate is diluted with 10 times its volume of water, and boiled for 15 minutes with washed silk. If coal-tar colours are present, the silk fibres become red or rose, but if absent they only turn yellowish or brownish.

Cochineal.—The dry mass is drenched with hydrochloric acid, and after 10 minutes shaken with twice its bulk of alcohol. The filtrate is diluted with 10 vols. of water and shaken with so much amyl alcohol that about 5 c.c. of the latter collect on the surface; the aqueous layer is then drawn off. To the amyl alcohol are added 1.5 vols. of carbon disulphide and 4—5 vols. of water, and after slight shaking the bottom layer is drawn off and the aqueous top layer is filtered. In the presence of cochineal, the filtrate is more or less yellowish-red, but becomes colourless when shaken with amyl alcohol; the latter then turns green when shaken with a solution of neutral uranium acetate.

L. DE K.

[**Urinary Indican.**] By JACOB BOUMA (*Zeit. physiol. Chem.*, 1900, 30, 117—125).—Many objections are urged against the method adopted by Wang for the estimation of urinary indican.

W. D. H.

Detection of Urobilin in Urine. By TH. ROMAN and G. DELLUC (*J. Pharm.*, 1900, [vi], 12, 49—50).—The advantage of rapidity is claimed for the following method of detecting urobilin. Eight to ten drops of pure hydrochloric acid and 20 c.c. of chloroform are added to 100 c.c. of urine, and, after carefully agitating, 2 c.c. of the chloroform solution are withdrawn; 4 c.c. of a solution of 1 gram of zinc chloride in 1 litre of alcohol of 95° are then added, without mixing, when the characteristic green ring appears between the two layers. On shaking, the liquid becomes rose-coloured, and shows a green fluorescence. Certain commercial alcohols, to which no zinc salt has been added, give, with the chloroform solution, the same reaction; this is due to their having dissolved traces of zinc during manufacture or storage.

W. A. D.

General and Physical Chemistry.

Spectra of Hydrogen and of Aqueous Vapour. By JOHN TROWBRIDGE (*Phil. Mag.*, 1900, [v], 50, 338—347).—Two spectra are attributed to hydrogen, the four-line spectrum, and the “white” spectrum consisting of a great number of lines. The author has studied the spectra with very powerful condenser discharges, employing a battery of twenty thousand Planté cells, and is of the opinion that the “white” spectrum only is a true hydrogen spectrum, and that the four-line spectrum is due to water vapour. In spite of all precautions to ensure dryness of the gas in glass vessels, it cannot be considered as dry when a condenser discharge is passed, since aqueous vapour is liberated from the glass, and with the powerful discharges employed essentially the same spectrum is obtained with hydrogen, rarefied air, or nitrogen. Aqueous vapour is therefore considered to be present in the solar atmosphere. Conclusions regarding the pressure and temperature of hydrogen in stars deduced from laboratory experiments in glass vessels are misleading, since conditions of electrical dissociation, aqueous vapour, &c., affect the nature of the spectrum more than pressure and temperature. L. M. J.

Influence of Slight Impurity on the Spectrum of a Gas. II. By PERCIVAL LEWIS (*Ann. Phys.*, 1900, [iv], 2, 447—458. Compare this vol., ii, 1).—The influence of a trace of mercury vapour on the spectrum of hydrogen has again been determined, this time with internal electrodes of iron; the intensity of the hydrogen lines is considerably diminished. The spectrum of nitrogen mixed with a trace of mercury, oxygen, or water vapour has been examined, and found to be less intense than that of the pure gas. The intensity of the bands in pure nitrogen reaches a maximum at a pressure of 3.5 mm. Sulphur and iodine vapour are without influence on the intensity of the nitrogen bands. The author considers that in spectroscopic investigations more account should be taken of the influence of slight impurity. J. C. P.

Lamps for Spectra. I. By ERNST BECKMANN (*Zeit. physikal. Chem.*, 1900, 34, 593—611).—The author, after discussing the various methods of colouring non-luminous flames, describes an apparatus whereby a fine spray of the colouring substance may be introduced into a flame. The tube of a burner is divided into two branches, which are bent round so that the outlets face each other. Below the point where the two jets meet, there is placed a small vessel containing a solution of the substance under examination. In this solution there is a spray-producer, consisting of a closed porous porcelain tube. This tube, which is connected with a reservoir of compressed air, allows a fine stream of the air to pass through and carry with it enough of the solution to impart a steady colour to the flame above. The permeability of the porcelain tube is increased, and the flame

colour rendered more intense, by impregnating the former with alcohol or some other organic liquid. J. C. P.

Fluorescence and Afterglow accompanying an Electric Discharge in Nitrogen. By PERCIVAL LEWIS (*Ann. Phys.*, 1900, [iv], 2, 459—468).—These phenomena are fully described by the author, and attributed to minute traces of oxygen present in the nitrogen. This oxygen probably is liberated by the discharge from a small quantity of water vapour persistently held by the glass. When the discharge tube is dried by heating sodium in it, neither fluorescence nor afterglow is observed. J. C. P.

Phosphorescence of Inorganic Substances. By EUGEN GOLDSTEIN (*Sitzungsber. K. Preuss. Akad. Wiss.*, 1900, 818—828).—Phosphorescence can be very advantageously detected by means of a form of apparatus in which the powdered substance falls from end to end of an exhausted tube, and is illuminated by cathode rays at one part of it; phosphorescent substances show a streak of coloured light, whilst other substances are only luminous in the path of the rays. The irregular results which have been usually obtained are due to impurities; salts of Li, Na, K, Rb, Cs, Ca, Sr, Ba, Al, Zr, Mg, Be, Zn, and Cd, which for the most part form colourless oxides, all show a blue to violet fluorescence, but minute traces of Cu, Cr, Mn, U, Ni, Co, Pb, Ce, La, Y, Er, Pr, or Nd suffice to produce a strong fluorescence which often entirely masks the blue fluorescence of the pure substance. T. M. L.

Action on Photographic Plates of Minerals containing Uranium and Thorium. By AFANASSÉEFF (*J. Russ. Phys. Chem. Soc.*, 1900, 32, ii, 103—106).—Fifty-one minerals were examined with regard to their power of emitting rays capable of affecting a photographic plate. In general, the presence in a mineral of a large percentage of uranium or thorium corresponds with a relatively intense photographic action. The fact that laranskite, which contains no uranium or thorium, produces an impression on a photographic plate, is explained by the presence in it either of some other mineral containing one of these metals or of a new element. T. H. P.

Meta-stable Character of the Weston Cadmium Element and its Uselessness as a Standard Cell. By ERNST COHEN (*Zeit. physikal. Chem.*, 1900, 34, 621—631).—Cadmium sulphate, $\text{CdSO}_4 \cdot \frac{8}{3} \text{H}_2\text{O}$, can exist in two different modifications below 15° . A cadmium amalgam with 14.3 per cent. of cadmium can exist in two different modifications below 23° . At 0° , the difference of potential between the two modifications of the cadmium amalgam amounts to 5 millivolts. It appears that the Weston cell studied in the Reichsanstalt is below 23° a meta-stable system, which may spontaneously change into a stable condition. As this change is accompanied by an appreciable alteration in the E.M.F., the Weston cells are useless as standards. The temperature formula given by Jaeger and Wachsmuth (*Abstr.*, 1897, ii, 86) applies between 0° and 23° to the meta-stable Weston cell, above 23° to the stable form of the same.

The author hints that probably similar results will be obtained in regard to the stability of the Clark cell. J. C. P.

The Weston Cell. By WILHELM JAEGER and ST. LINDECK (*Zeit. physikal. Chem.*, 1900, 35, 98—99).—Cohen (preceding abstract) has stated that below 23° the Weston cell is in a metastable state and is hence unsuitable for a normal element. The authors dissent from his views and point out that the concentration of the amalgam employed by Cohen (14.3) is considerably greater than that of the normal Weston cell (12.7). L. M. J.

Thermodynamics of Normal Cells. II. By ERNST COHEN (*Zeit. physikal. Chem.*, 1900, 34, 612—620).—The calculations made in the previous paper (this vol., ii, 520) relative to the Clark cell were based on measurements made with the system $\text{Hg} \mid \text{Hg}_2\text{SO}_4$ —saturated zinc sulphate solution \mid zinc amalgam. No error was thereby introduced, since zinc and zinc amalgam show the same potential difference in a zinc sulphate solution, provided the amalgam contains more than 2 per cent. of zinc. With the cadmium of the Weston cell, which is dealt with in the present paper, the case is different; the 14.3 per cent. cadmium amalgam used in Jaeger and Wachsmuth's work (*Abstr.*, 1897, ii, 86) shows an electromotive behaviour different from that of pure cadmium. Taking account of this, the essential changes that take place in the Weston cell are represented by the following equations: $\text{Cd} - \text{amalgam} \rightleftharpoons \text{Cd} + \text{Hg}$, and

Liquid.

Solid.

where A is the number of water molecules present for every one of cadmium sulphate in the saturated solution. On this basis, E_o , the total heat effect accompanying the passage of 2×96540 coulombs through the cell, is calculated to be 47286 cal., whilst the electrical measurements of Jaeger and Wachsmuth lead to the value 47880 cal.

J. C. P.

An Application of Poynting's Theorem. By GUSTAV MIX (*Zeit. physikal. Chem.*, 1900, 34, 522—528).—A mathematical paper not suitable for abstraction. J. C. P.

Quantitative Lecture Experiments on Electrochemistry. By W. LASH. MILLER and FRANK B. KENRICK (*J. Physical Chem.*, 1900, 4, 599—618).—The authors describe a very ingenious instrument for use on a lecture table which is capable of marking the necessary changes of resistance in a Wheatstone bridge and of indicating to a class the resistance required. The principle of the method is the following. The needle of a dead beat galvanometer of the D'Arsonval pattern, when displaced from its zero position, completes a relay circuit and by means of suitable mechanism causes a rheostat to turn and alter the resistance, the direction being dependent on the side to which the needle moves. This rheostat is provided with a dial and pointer, which indicate the resistance. When the equilibrium is reached and the

needle returns to zero, contact is broken and the motion of the rheostat ceases. The authors describe how, by means of this instrument, various electrolytic experiments may be shown to a class, as, for example, the proof of Ostwald's law, preparation of isohydric solutions, measurements of E.M.F.s, and of polarisation, &c. L. M. J.

Relations between Polarisation and Current Density in Solid and Fused Salts. By ALBERT GÖCKEL (*Zeit. physikal. Chem.*, 1900, 34, 529—558).—A number of experiments made with lead chloride, bromide, and iodide, cadmium iodide and bismuth bromide, at temperatures both above and below their melting points, show a rapid increase of the polarisation with the current density. The chief factors to be taken into account are the absorption of the liberated gases by the electrodes, and the solution and diffusion of these gases in the electrolyte. On the supposition that the concentration of the gas absorbed in the anode is proportional to the potential difference between the electrodes (compare Jahn and Schönrock, *Abstr.*, 1895, ii, 198), a formula is deduced giving the polarisation in terms of the current density. This formula agrees closely with the experimentally determined relation of polarisation and current density, except for high values of the latter and at temperatures much above the melting point of the salt. Under these conditions, the values of the polarisation approach a maximum, and a hyperbolic curve must be substituted for the logarithmic one. J. C. P.

Difference of Potential between a Solid Salt and its Solution. By A. CAMPETTI (*Atti Real. Accad. Lincei*, 1900, [v], 9, ii, 27—31).—By measuring the E.M.F. of a cell of the type $Hg | L_1 | \text{salt} | L_2 | Hg$, where L_1 and L_2 are solutions of different concentrations of the solid salt in contact with them, it is found that a difference of potential exists between a solid salt and its non-saturated solution, the order of magnitude and sign being the same as those of the potential difference existing between a concentrated and a dilute solution of the same salt. T. H. P.

Electromotive Efficiency of the Elementary Gases. I. By EMIL BOSE (*Zeit. physikal. Chem.*, 1900, 34, 701—760).—A general review of the work done on gas cells, and a discussion of their theory. The chief problems treated by the author are: (1) In what condition are the gases present in the electrode? (2) What is the part played by the electrode itself? (3) How do the metallic electrodes transmit the electromotive efficiency of the gases? (4) How far is agreement attained between measurements made with the same gas and electrolyte, but with different electrodes?

The conclusions of the paper are as follows. The electromotive efficiency of the elementary gases is determined by their solubility in the electrodes. The gases in the electrodes, on account of the high dissociating power of the latter, are to be regarded as wholly or partly dissociated into single atoms; the ions of an electromotively active substance are already present in the electrode. The electrolytic solution pressure is the product of the osmotic pressure of these ions and a factor which is a constant for each solvent, and termed by the

author the electrolytic partition coefficient. The saturation of the electrode with a gas is an extremely slow diffusion process. Grove's gas battery is reversible, but its E.M.F. with the gases under atmospheric pressure has certainly a higher value than that usually given. In the acid hydrogen-oxygen cell, the water is formed at the oxygen electrode, in the alkali hydrogen-oxygen cell at the hydrogen electrode. The second electrolytic decomposition point of water corresponds with a non-reversible process.

J. C. P.

Electromotive Behaviour of Substances with several Stages of Oxidation. I. By ROBERT LUTHER [with D. R. WILSON] (*Zeit. physikal. Chem.*, 1900, 34, 488—494).—On thermodynamical grounds, the same amount of work must be required to raise a substance from its lowest (*L*) stage of oxidation to its highest (*H*), whether this is done directly or through an intermediate (*I*) oxidation stage; thus $A_{L-H} = A_{L-I} + A_{I-H}$, where *A* is the change in the free energy. Application of this general theorem to the oxidation of copper from the metallic to the cupric stage leads to the relation: $2\Pi_{Cu} \rightarrow Cu^{++} = \Pi_{Cu+Cl} \rightarrow CuCl + \Pi_{CuCl} \rightarrow Cu^{++} + Cl^{-}$; a similar relation is deduced when bromine is substituted for chlorine. Under the supposition that the E.M.F. between metal and electrolyte depends on the concentration of the particular metallic ion, the deductions from the theory were confirmed experimentally in both the above cases.

J. C. P.

Passivity of the Metals. By WILHELM HITTOFF (*Zeit. physikal. Chem.*, 1900, 34, 385—402).—The author's work on the electromotive behaviour of chromium (Abstr., 1898, ii, 363; 1900, ii, 127) has suggested that the passive or inactive condition of iron may not be due to a superficial layer of oxide, as generally supposed. When in the combination $Fe | NaNO_3, H_2CrO_4 | Pt$, the circuit is completed by dipping the iron in the salt solution, the E.M.F. gradually falls from 1.83 to 0.1 volt; the iron becomes quite passive, retains its metallic lustre, and is not attacked, however long the cell is short-circuited. The metal gradually returns to its active condition when it is washed, dried, and allowed to lie in the air, or when the circuit is opened. These facts show that the passive condition of iron cannot be due to a film of oxide. Similar results are obtained when the sodium nitrate in the cell is replaced by other oxy-salts or by a soluble cyanide. The concentration of the electrolyte in which the iron is immersed has but little influence on the phenomenon. The longer the cell has been short-circuited, the longer is the iron in recovering its activity.

Iron becomes passive still more readily when it is made the anode with a stronger current. If the external E.M.F. is high enough to decompose the electrolyte, bubbles of oxygen are liberated at the iron anode, the latter behaving like a noble metal; at the same time, the surrounding liquid becomes acid. Iron that has become passive loses its passivity at once when it acts as a cathode. Immersion in strong nitric acid induces passivity, but the passivity lasts only as long as the immersion; to nitric acid of sp. gr. 1.35, iron is indifferent only when in contact with an electronegative conductor, such as platinum or gold; the passivity caused in this way endures after the contact is

broken. Potassium and sodium hydroxides render iron passive under the same conditions as the salts of the oxy-acids. When the iron in the cell $\text{Fe} \mid \text{NaNO}_3, \text{H}_2\text{CrO}_4 \mid \text{Pt}$ has been tarnished by heat, the E.M.F. is the same as when freshly polished iron is used, a further fact opposed to the view that passivity is due to superficial oxidation.

When nickel takes the place of iron in the cell just described, the E.M.F. likewise decreases, so that nickel also can assume the passive condition. Cobalt also is capable of passivity, but to a less extent than nickel.

The author looks on the molecules of a passive metal as being in a certain state of tension, which passes away when the metal is left to itself. J. C. P.

Oettel's Gasometric Method. By ANDRÉ BROCHET (*Bull. Soc. Chim.*, 1900, [iii], 23, 724—726).—A concise explanation of the method devised by Oettel for the continuous study of electrolysis. The volumes of hydrogen and oxygen evolved at the cathode and anode respectively, are compared with the volumes of these gases yielded by a gas voltameter placed in circuit with the electrolytic cell. N. L.

Accessory Reactions in Electrolysis. By ANDRÉ BROCHET (*Bull. Soc. Chim.*, 1900, [iii], 23, 736—740).—In the electrolysis of concentrated solutions of sodium hypochlorite, more of this salt is decomposed, and more chlorate is produced, than is required by Faraday's law. This result is explained by the fact that the liquid in the immediate neighbourhood of the anode is always acid and that the hypochlorous acid thus liberated in concentrated solution is partially transformed into chloric acid by auto-oxidation (this vol., ii, 276). The decomposition is quite independent of the electrolytic action, although indirectly caused thereby, and may fitly be termed an "accessory" reaction. N. L.

Researches on Electrolytic Reduction. By WALTHER LÖB (*Zeit. physikal. Chem.*, 1900, 34, 641—668. Compare Abstr., 1899, i, 122).—The main portion of this paper has already been abstracted (this vol. i, 697). In addition, the author replies to Haber's criticism of his views, and holds that no objection can be made to the assumption that the work of reduction in alkaline solution is effected by the sodium ions. A large number of chemical processes support this view. J. C. P.

Electrolytic Solution Pressure. Reply to Lehfeldt. By FRIEDRICH KRÜGER (*Zeit. physikal. Chem.*, 1900, 35, 18—22).—Many of the numerical data given by Lehfeldt in his criticism of the theory of solution pressure (this vol., ii, 62) are incorrect, notably the statement that for the formation of the double layer 1.27 grams of zinc per square cm. must pass into solution; the author calculates that this value should be 3×10^{-9} .

WALTHER NERNST in a footnote to the paper, also replies to Lehfeldt's statement that the theory of concentration chains was developed on an insufficient experimental basis. L. M. J.

Degree of Dissociation and Dissociation Equilibrium in the case of Highly Dissociated Electrolytes. By HANS JAHN (*Zeit. physikal. Chem.*, 1900, 35, 1—10).—The author has previously pointed out that the cause of the apparent divergences from Ostwald's law probably lies in the variation of ionic velocities (this vol., ii, 522). By E.M.F. observations, the ratio of the ionic concentrations of two solutions can be found, and, assuming Ostwald's law, the actual concentration may also be determined. The author calculates in this manner the ionic concentration of a dilute solution of potassium chloride from E.M.F. observation with six other more concentrated solutions; the values obtained from the last five solutions only vary between 0.001638 and 0.001642. Similar results were obtained for hydrochloric acid and sodium chloride. Assuming the value so obtained for the most dilute solution, the ionic concentrations of the stronger solutions were calculated and are found to agree well with the values calculated by the dilution law. By comparing these values with those obtained by conductivity experiments, the ionic velocities are determined and are found in all cases to decrease with dilution. There is hence no reason for doubting the validity of Ostwald's dilution law, even for strong electrolytes.

L. M. J.

Magnetic Force of the Atoms. By ROBERT LANG (*Ann. Phys.*, 1900, [iv], 2, 483—494).—A paper mainly physical in character. The author suggests that free valencies are responsible for the atomic magnetism, and points out that for cobalt, nickel, iron, and manganese the atomic magnetisms and the number of free valencies run parallel. It is also noted that the two conditions for the appearance of paramagnetism, namely, (1), a minimum atomic volume, (2) free valencies, are fulfilled in the case of oxygen. The author's view of the connection between free valency and atomic magnetism would explain the rule found by Meyer (this vol., ii, 7), that the molecular magnetism of paramagnetic compounds is less than the sum of the atomic magnetisms of the components.

J. C. P.

Has Magnetism an Influence on Chemical Reactions? By ALEXANDRE DE HEMPTINNE (*Zeit. physikal. Chem.*, 1900, 34, 669—682).—Although, according to theory, magnetism must have an influence on chemical equilibrium and reaction velocity, yet this influence is too small to be of any practical consequence. The electrical conductivity of a solution, the catalytic action of acids, the inversion of cane sugar, and the velocity of combination of hydrogen and chlorine are found to be unchanged in a magnetic field.

J. C. P.

Magnetic Behaviour of Alcohols. By GG. HEINRICH (*Chem. Centr.*, 1900, ii, 156; from *Sitzungsber. Bayr. Akad. Wiss.*, 1900, 33—36).—All alcohols exhibit diamagnetism. For one and the same alcohol the product of kM , the molecular magnetism, and H , the field strength is constant. This product kMH is different for different alcohols, and is not a purely additive but a constitutive constant. It has the following values: methyl alcohol, -0.185; ethyl alcohol -0.296; *n*-propyl alcohol -0.392; isopropyl alcohol -0.409; *n*-butyl alcohol -0.520; isobutyl alcohol -0.541; trimethylcarbinol -0.482; isomethyl alcohol -0.599; dimethylethylcarbinol -0.563.

J. C. P.

Magnetic Susceptibility of Aromatic Organic Substances. By HUGO FREITAG (*Chem. Centr.*, 1900, ii, 156; from *Sitzungsber. Bayr. Akad. Wiss.*, 1900, 36).—The same general relations hold as for the alcohols investigated by Heinrich (preceding abstract). The product kMH has the following values: *o*-xylene - 0.734; *m*-xylene - 0.718; *p*-xylene - 0.685; ethylbenzene - 0.675; ψ -cumene - 0.823; mesitylene - 0.773. J. C. P.

Relation between Heat of Solution and Solubility of Electrolytes. By J. J. VAN LAAR (*Zeit. physikal. Chem.*, 1900, 35, 11—17).—The author's and van't Hoff's formulæ connecting the heat of solution and solubility of electrolytes contain certain integration difficulties leading to errors which are not negligible. The author modifies his formula so as to make these smaller, and shows that it leads to better results. L. M. J.

Continuous Change and Thermodynamics. VI. By PIERRE DUHEM. (*Zeit. physikal. Chem.*, 1900, 34, 312—377).—A continuation of the author's previous papers on this subject (*Abstr.*, 1897, ii, 439; 1898, ii, 132; this vol., ii, 524), in which it is shown that the change from yellow to red phosphorus is probably an example of the same form of slow change as that of monoclinic to rhombic sulphur (*Abstr.*, 1897, ii, 439). The hardening, tempering, scorching, and forging of metals are also considered, the changes being regarded as of the nature of hysteresis and the equations previously deduced are applied. L. M. J.

Diminution of Vapour Pressure and Elevation of Boiling Point of Dilute Solutions. By A. SMITS (*Proc. K. Akad. Wetensch. Amsterdam*, 1900, 2, 635—640. Compare this vol., ii, 389).—Making use of the apparatus formerly described (*loc. cit.*), measurements have been made of the elevation of boiling point of solutions of varying concentration of potassium chloride and nitrate, and sodium chloride, and, in the case of the last salt, of the diminution of vapour pressure also. The following table gives the concentrations of the various solutions corresponding with an increase of the boiling point of water of 1°, 2°, &c.

Increase in boiling point.	Grams of salt per 100 grams water.		
	Sodium chloride.	Potassium chloride.	Potassium nitrate.
1°	7.7	9.0	12.2
2	13.4	17.1	26.4
3	18.3	24.5	42.2
4	23.1	31.4	59.6
5	27.1	37.8	78.3

Thus, in the case of potassium nitrate, the fact, already noticed for dilute solutions, that the concentration increases more rapidly than the elevation of boiling point, also holds for concentrated solutions. This is also true for dilute solutions of sodium and potassium chlorides, but with concentrations greater than 0.5 gram-mol. per 1000 grams of water the ratio of concentration to elevation of boiling point decreases.

T. H. P.

Vapour Pressure of a Series of Benzene Compounds. By BENEDIKT WORINGER (*Zeit. physikal. Chem.*, 1900, 34, 257—289).—The vapour pressure curves were determined by the statical method for benzene, hexylene, hexane, toluene, octane, ethylbenzene, *p*-xylene, *m*-xylene, *o*-xylene, propylbenzene, isopropylbenzene, decane (diamyl), isobutylbenzene, ψ -cymene, cymene, and mesitylene; expressions of the form $p = ae^{-b/\theta} \cdot \theta^{c+d \log \theta}$ are used to represent the curves, θ being the absolute temperature and a, b, c, d being constants. The vapour pressure curve of mesitylene is noticeable, as owing to the slow temperature increase it cuts those of most of the other compounds. From the results the author enunciates eleven laws, for which the original must be consulted.
L. M. J.

Cryoscopic and Ebullioscopic Researches. By ANGELO BATELLI and A. STEFANINI (*Ann. Chim. Phys.*, 1900, [vii], 20, 64—125).—The authors consider very fully the various errors of experiment in cryoscopic observations, but add nothing to what has already been published by Wildermann (this vol., ii, 131); they also discuss the results of Loomis, Jones, Abegg, Wildermann, Ponsot, and Raoult. The apparatus employed by the authors themselves is described, and the results are given of their observations with solutions of tartar emetic and sucrose. For the latter, the value 2.02 was obtained for the molecular depression in a *N*/1000 solution, but for solutions of 2.2 *N*/1000 to 4.2 *N*/100 the values only vary between 1.83 and 1.88, so the conclusion is drawn that within the limits of experimental error the molecular depression is constant, and equal to the calculated value 1.87. An apparatus for the determination of boiling points is also described, by means of which the molecular weight of tartar emetic was found, the values varying from 287 to 329.
L. M. J.

Calculations in connection with the Equations of Condition for Liquids. I. Determination of the Constants a and b of van der Waals' Equation. By PHILLIPE A. GUYE and L. FRIDERICH (*Chem. Centr.*, 1900, ii, 156; from *Arch. Sci. phys. nat. Genève*, [iv], 9, 505—536).—The authors consider that too little use has been made of the experimental data available for this purpose, and calculate the value of the constants for a number of substances, as summed up in the following table:

Substance.	T_c .	P_c .	a .	b .	Substance.	T_c .	P_c .	a .	b .
			0.0	0.00				0.0	0.00

In the course of these calculations the authors find empirically a numerical relation between b , the critical pressure P_c , and the critical temperature T_c .
J. O. P.

A New Coal Calorimeter. By SAMUEL W. PARR (*J. Amer. Chem. Soc.*, 1900, 22, 646—652).—The apparatus differs from those usually employed in the fact that no gaseous oxygen is required, the coal being burned by means of sodium dioxide; the carbon dioxide and water produced are absorbed by the sodium oxide formed.

One gram of the sample, dried at 105° , is mixed with 17 grams of sodium dioxide, the mixture is put into a cartridge which is placed into an insulated vessel containing a certain volume of water of known temperature. The charge is fired by means of a red hot copper wire, the increase in temperature is noticed, and the usual calculation made. For exact particulars of the construction of the apparatus and the cartridge, the illustrations of the original paper should be consulted.

An allowance of 27 per cent. of the total indicated heat must be made on account of the heat developed in the combination of the carbon dioxide and the water with the chemical employed. An allowance must also be made for the use of the hot copper wire; the average of many determinations on various lengths up to 2 inches established a fairly uniform factor of 0.012° per half-inch of No. 12 copper wire.

L. DE K.

Heat of Formation of Alloys. By J. B. TAYLER (*Phil. Mag.*, 1900, [v], 50, 37—43).—The heats of formation of a number of alloys were determined by measuring the heat of solution in mercury of the alloy and of the mixed metals, the assumption being made that the solutions are identical. It was thought that combination only took place for a very small proportion of the mixed metals, and that the best results would therefore be obtained when one metal is present in great excess, but the results showed that in this case far greater values for the heat of formation are obtained.

L. M. J.

Want of Uniformity in the Action of Copper-Zinc Alloys on Nitric Acid. By JOHN H. GLADSTONE (*Phil. Mag.*, 1900, [v], 50, 231—237).—The heats of formation of copper-zinc alloys have been determined from observations on the heat of dissolution of alloys and mixtures in nitric acid. These are shown to be untrustworthy, inasmuch as the products of the reaction are not similar in the two cases. By comparison of the heats of dissolutions of a few alloys rich in copper, for which, however, the products are practically identical, the author finds that the heat evolved is less than would be expected, and considers the deficit must be regarded as due to the heat of formation of the alloy. Further experiments are, however, desirable, with solvents the action of which is simpler than that of nitric acid (compare preceding abstract).

L. M. J.

Steam and Brines. By JOHN Y. BUCHANAN (*Trans. Roy. Soc. Edin.*, 1898, 39, 529—573).—The temperatures of boiling mixtures of steam and numerous salts have been determined under different pressures, the method followed being to blow steam through the coarsely powdered salt. The boiling temperature of the mixture is constant so long as there is an abundant supply of steam and salt,

The experiments were continued after all the salt was dissolved, the weight of steam condensed and the temperature of the liquid being observed at intervals; in this way, the concentrations and boiling temperatures of salt solutions of different strengths were determined.

The most complete series of experiments were those made with sodium chloride. In these, the atmospheric pressure varied from 550—772 mm., and the temperature of saturated steam from 91·2—100·44°, the corresponding temperatures of the boiling saturated solution being 99·3° and 108·98°. The ratio of the atmospheric pressure to the vapour tension of water at the temperature of the boiling mixture is practically constant, and equal to 0·7435. The other salts experimented with were potassium, ammonium and barium chlorides, potassium chlorate, sodium, barium, strontium and lead nitrates, potassium and ammonium sulphates. For these salts, the ratio $(p - P)/p$, where P is the atmospheric pressure, and p is the vapour tension of water at the temperature of the boiling mixture, decreases with falling pressure; this depends chiefly, if not entirely, on the diminished solubility of the salt at the lower temperature.

When $t - T$ is the difference between the boiling point of a solution and the boiling point of water at the same time and place, and W is the weight of steam condensed between the beginning of the experiment and the time when the difference of boiling points is $t - T$, it is found that $W(t - T)$ for some salts is nearly constant. For sodium and potassium chlorides, the values of $W(t - T)$ diminish very considerably as W increases.

One or two solubilities at the boiling point t of the saturated solution may be noted; the quantity of salt taken in each case is 0·2 gram-molecule.

a is the weight of steam condensed for complete solution.

J. C. P.

The Law of Cailletet and Mathias and the Critical Density. By SYDNEY YOUNG (*Phil. Mag.*, 1900, [v], 50, 291—305).—By the examination of the known data in the case of about 30 different compounds, the author tests the validity of the law of Cailletet and Mathias which states that the mean of the densities of liquid and saturated vapour of any stable substance is a rectilinear function of the temperature. The law is not found to be absolutely true, but is a very close approximation, the values, when plotted, forming a curve the curvature of which decreases the more nearly the ratio of the actual to the theoretical critical density approaches the theoretical value 3·77. This is well seen in the case of *n*-pentane, for which the ratio is 3·765 and for which the law holds accurately. The curvature is also found to be in opposite directions according as the ratio is greater or less than 3·77. The ratio $\alpha T_c/D_c$, where α is the temperature coefficient of the mean density, appears to have a normal value of 0·93 and varies in the same sense as the above ratio. The curvature of the mean density curve is as a rule so slight that the critical density may be

calculated if the extrapolation is small, but errors of 5 or 6 per cent. may occur if the calculation is made from the mean densities at temperatures below the boiling point.

L. M. J.

Velocity of Solidification and Viscosity of Supercooled Liquids. By HAROLD A. WILSON (*Phil. Mag.*, 1900, [v], 50, 238—250).—The velocity of solidification of a supercooled liquid increases with the supercooling until a maximum constant value is reached, after which it may decrease; various explanations, but none entirely satisfactory, have been given for this (Tammann, *Abstr.*, 1898, ii, 425). The author, starting with the supposition that solidification is due to the difference of internal pressure between liquid and solid at the surface of separation and the consequent forcing of liquid molecules into the solid, deduces the expression $v = Cs/V$, where v is the velocity of solidification, c a constant, s the supercooling, and V the viscosity of the liquid. The temperature at the surface of separation of solid and liquid is not equal to that of the main bulk, and was determined in the case of salol by means of a small thermo-couple, and the values of the supercooling were corrected. The viscosity was also determined, and the value of C being deduced from the experiments the values of v were calculated for the whole series and found to agree well with the observed values. Concordant values were also obtained for benzoic anhydride, benzophenone and azobenzene, although the corrections for the overcooling were not found, and the author's formula appears to be well justified.

L. M. J.

Extent to which the Interaction of Ionic Charges diminishes the Osmotic Pressure. By VL. VON TÜBIN (*Zeit. physikal. Chem.*, 1900, 34, 403—408).—A mathematical paper not suitable for abstraction.

J. C. P.

A Model to Show Ionic Mobility. By FRIEDRICH KOHLRAUSCH (*Zeit. physikal. Chem.*, 1900, 34, 559—560).—Small metallic cylinders representing various ions have attached to them cords passing over grooved wheels, and move up and down in channels cut in the face of an upright wooden board. The size of the wheels is so adjusted that the velocities of the cylinders upwards and downwards are in the ratio of their ionic velocities.

J. C. P.

Supposed Isomerism of Red and Yellow Mercuric Oxide, and the Surface Tension of Solid Bodies. By WILHELM OSTWALD (*Zeit. physikal. Chem.*, 1900, 34, 495—503).—The difference of potential found by Cohen (this vol., ii, 184, 381) is not necessarily in conflict with the author's view that the only distinction between red and yellow mercuric oxide lies in the size of the grains. Such a difference in grain would mean a difference in solubility, and this again would cause a difference in potential. The author describes how the red oxide by mere rubbing up in a mortar takes on the colour of the yellow oxide. That the fine precipitated yellow oxide is more soluble than the larger grained red oxide was shown by shaking each with normal potassium bromide solution until equilibrium was established (compare Bersch, *Abstr.*, 1891, 1413). As the red oxide was powdered its solubility gradually approached that of the yellow oxide.

The author regards this case as illustrating the influence of surface tension on chemical equilibrium, and describes further experiments in which a difference in grain size was found to cause a difference in solubility. When two corresponding values of the grain size and solubility are known, a formula may be obtained for the surface tension between solids and their saturated solutions. J. C. P.

Composition of the Surface Layers of Aqueous Solutions. By JAN VON ZAWIDZKI (*Zeit. physikal. Chem.*, 1900, 35, 77—80).—A small quantity of saponin was mixed with solutions of acids, and a current of air, previously passed through a similar solution (without the saponin), was drawn through the acid causing it to froth up, this froth being collected and condensed in a second vessel. The concentrations of acid in the solution and froth were then determined. With acetic and hydrochloric acids, an increase of 0.4 and 0.8 per cent. respectively was found; this could not be an effect of volatility, as, apart from the precautions observed, the variation due to this cause should be in opposite senses for the two acids. The results hence confirm theoretical deductions that the concentration is greater in the surface layers. L. M. J.

Formation of Salts in Alcoholic Solutions. By SIMEON TANATAR and BORIS KLIMENKO (*Zeit. physikal. Chem.*, 1900, 35, 94—95).—The authors' previous experiments were extended to propionic, caprylic, hippuric, acetic, and chloroacetic acids (see Abstr., 1898, ii, 563). The heat of neutralisation by ammonia was in all cases greater than that by potassium hydroxide, and the values are not in the same order. For potassium hydroxide, the values lie between 7.4 and 8.9, and for ammonia between 11.5 and 14.4, so that they differ considerably from the values in aqueous solutions. The authors intend to further determine the dependence of the values on the state of ionisation. L. M. J.

Colloidal Metallic Solutions. By K. STOECKL and LUDWIG VANINO (*Zeit. physikal. Chem.*, 1900, 34, 378—379).—A controversial paper in which the authors defend their views concerning the nature of colloidal solutions (this vol., ii, 11). L. M. J.

Flocculation of Turbid Media. By WALTHÈRE SPRING (*Rec. Trav. Chim.*, 1900, 19, 204—235).—This paper commences with an historical summary of the researches of previous observers on liquids rendered turbid by the presence of solid substances in a minute state of division (pseudo-solutions), and a bibliography of the subject is given in an appendix. Details are then given of the author's own experiments, the results of which are summarised as follows.

Solutions of salts which, like those of polyvalent metals, cannot be obtained in an optically transparent condition (Abstr., 1899, ii, 537) bring about the flocculation of turbid liquids much more readily than solutions of any other salts. This result is due partly to the agglutinative power of the metallic hydroxides formed by the hydrolysing action of the water, and partly to the flocculating action

of the acids simultaneously produced. The extent of the flocculation caused by hydroxides is closely connected with their chemical and physical character as well as with the nature of the turbidity. The behaviour of the turbidity towards salt solutions somewhat resembles that of a membrane, the acid formed by the hydrolysis of the salt traversing the liquid by diffusion whilst the metallic hydroxide is precipitated with the substance causing the turbidity. The persistence of very fine turbidities bears a relation to the Brownian motion. In consequence of this motion, particles suspended in pure water frequently collide with one another without coming into actual contact, but if an electrolyte is present the particles agglutinate, the Brownian motion ceases, and the flocks formed are deposited. The flocculation of liquids is not brought about by electrical action at a distance, as by Röntgen rays or the electricity developed by a statical machine or an induction coil, and cannot therefore be compared with the precipitation of dust particles in air. The feeblest electric current is, however, sufficient to induce clarification, which in the majority of cases commences at the cathode. Electrolytes of the same conductivity but having different anions and cations influence the flocculation very unequally. Electrolytes having the same cation induce flocculation in equal times, whilst the nature of the anion plays only a secondary part. The rate of flocculation in different electrolytes having the same anion is exactly in the order of the velocities of the cations in electrolysis. It therefore appears that the primary cause of the flocculation brought about by electrolytes is to be sought in the velocities of the ions. N. L.

Solid Solutions and Isomorphous Mixtures of Saturated and Non-saturated Open-chain Compounds. III. By GIUSEPPE BRUNI and F. GORNI (*Atti. Real Accad. Lincei*, 1900, [v], 9, ii, 151—156. Compare Abstr., 1899, ii, 731).—The isomorphism existing between stilbene and dibenzyl (*loc. cit.*) is also observed in their *pp*-dimethyl-derivatives. Stilbene, diphenylmethane, and diphenylamine do not form isomorphous mixtures as is the case with phenanthrene, fluorene, and carbazole, although the three compounds of each group are similarly related to one another. Neither cinnamic nor *allocinnamic* acid forms solid solutions with phenylacetic acid, but this property is exhibited by *p*-nitrobenzoic acid and *p*-nitrobenzaldehyde. T. H. P.

Limits of the Solid State. V. By GUSTAV TAMMANN (*Ann. Phys.*, 1900, [iv], 3, 161—194. Compare Abstr., 1899, ii, 635).—For pressures between 1 and 1200 kilograms per sq. cm. (the corresponding melting points being 5.4° and 36.5°), the latent heat of fusion of benzene has the mean value 30.7 cal., and does not vary appreciably. The volume changes accompanying fusion have been determined at different points on the melting point curve for benzene, naphthalene, phosphorus, and dimethylethylcarbinol; the volume change is found to diminish proportionally to the rising temperature of fusion, although considerable deviations from this rule are noted in the case of benzene above 60° . The volume change accompanying the transition of rhombic into monosymmetric sulphur is practically the same for all points on the transition point curve. The lowering of the freezing

point due to foreign substances increases markedly with rising pressure.

The author then discusses the general form of the melting point curve in the light of these results. His previous contention that the volume change and latent heat of fusion do not simultaneously become zero is upheld. Further, in the case of a transition, when the volumes of the two phases are equal, one at least being crystalline, the transition is accompanied by a change of energy. J. C. P.

Equilibrium between Lead and Zinc, and Mixtures of their Fused Chlorides. By W. REINDERS (*Zeit. anorg. Chem.*, 1900, 25, 126—145).—When a mixture of fused zinc and lead chlorides is electrolysed between carbon poles with a potential difference of 15—30 volts, the metallic regulus formed consists almost entirely of lead, even when the percentage of lead chloride in the fused mixture is small. At the temperature of the experiments (515°) zinc and lead are only partially miscible, and it might be expected that the curve connecting the percentage of lead in the regulus with the percentage of lead chloride in the fused mass would show a discontinuity. The curve, however, is found to be continuous, and it is suggested that in the electrolysis the proportions of the two metals liberated are not those which are in equilibrium with the fused mixture. A simple assumption would be that they are separated in the same ratio in which they are present in the fused mixture, and that the establishment of equilibrium is a subsequent and secondary process. Experiments were made in which zinc, zinc chloride, and lead chloride were shaken up together for several hours at 515°. The greater portion of the lead is found in the regulus at the end of the experiment, and it appears that in all cases where the percentage of lead chloride in the fused mixture is greater than 0.1, the regulus consists almost exclusively of lead.

If lead and zinc were miscible in all proportions the potential difference regulus | fused mixture would change continuously from the value for $\text{Pb} | \text{PbCl}_2$ to that for $\text{Zn} | \text{ZnCl}_2$. Since, however, the metals are only partially miscible, this will not be the case. When a mixture of the fused salts is in equilibrium, (1) with the saturated solution of zinc in lead, (2) with the saturated solution of lead in zinc, the potential differences in the two cases should be equal. This is borne out by experiment, for it is found that the E.M.F. of the combination $89.36\text{Pb} \ 10.64\text{Zn} | 99.9\text{ZnCl}_2 \ 0.1\text{PbCl}_2 | \text{PbCl}_2 | \text{Pb}$ is the same as that of the combination $3.16\text{Pb} \ 96.83\text{Zn} | 99.9\text{ZnCl}_2 \ 0.1\text{PbCl}_2 | \text{PbCl}_2 | \text{Pb}$, namely, 0.278 volt at 515°. The potential difference $\text{Pb} | \text{PbCl}_2$ is raised by the addition of zinc. J. C. P.

Solubility of Carbonates of Alkaline Earths in Water containing Carbon Dioxide. By GUIDO BODLÄNDER (*Zeit. physikal. Chem.*, 1900, 35, 23—32).—The formulæ representing the equilibrium between carbonates, bicarbonates, and carbon dioxide are deduced, these leading to the result $\text{K} \cdot \text{CO}_2 = k(\text{HCO}_3)_2^2$, or $\text{HCO}_3/k \sqrt{\text{CO}_2} = \sqrt{k}$. The values for \sqrt{k} are hence determined for solutions of calcium and barium carbonates, with results satisfactorily constant. The case of

magnesium carbonate is more complicated on account of the solubility of the hydrated magnesium carbonate, but this being taken into consideration, concordant results are obtained. The hydrolysis is also calculated for each of the compounds, and it is shown that the bicarbonates can only exist in solution in the presence of free carbon dioxide.

L. M. J.

Theory of the Fractional Precipitation of Neutral Salts and its Application in Analytical Chemistry. By ALEXANDER FINDLAY (*Zeit. physikal. Chem.*, 1900, 34, 409—436).—The author has studied the reversible reaction $\text{PbSO}_4 + 2\text{NaI} \rightleftharpoons \text{PbI}_2 + \text{Na}_2\text{SO}_4$, and found that the equilibrium constant given by the equation $K = C_2^2/C_1$, where C_1 and C_2 are the concentrations of the iodine and sulphate ions respectively, has a value between 0.25 and 0.30 at 25°. This result was obtained analytically, lead sulphate and iodide being shaken up with a mixed solution of sodium sulphate and iodide until equilibrium was established. The degrees of dissociation of the salts in the mixed solution were calculated by Kay's method (this vol., ii, 198).

The equilibrium constant of such a reaction as this defines the extent to which a separation of two salts by fractional precipitation can be effected. The addition of a soluble lead salt to a mixed solution of sodium iodide and sulphate causes the precipitation of lead iodide when the ratio C_2^2/C_1 in the solution is greater than K ; when, by the removal of iodine ions, the ratio C_2^2/C_1 has become equal to K , further addition of soluble lead salt precipitates both sulphate and iodide. When the ratio C_2^2/C_1 in the solution is less than K , lead sulphate is precipitated first. A few experiments showed that the rate of precipitation of lead iodide is greater than that of lead sulphate.

The values of K obtained analytically were confirmed electrically. The E.M.F.s of the electrodes $\text{Pb} \mid \text{PbI}_2, \text{NaI}$ and $\text{Pb} \mid \text{PbSO}_4, \text{Na}_2\text{SO}_4$ were determined separately with the help of a normal electrode, and combination of the values for the separate electrodes gave the E.M.F. Π of the cell $\text{Pb} \mid \text{PbI}_2, \text{NaI} \mid \text{Na}_2\text{SO}_4, \text{PbSO}_4 \mid \text{Pb}$. From theoretical considerations $\Pi = 0.02953 \log.(K/a)$, where K is the equilibrium constant and a the ratio C_2^2/C_1 in the solutions employed. The values of K calculated from this equation agree with those obtained analytically.

J. C. P.

Studies on Inversion. I. By ERNST COHEN (*Proc. K. Akad. Wetensch. Amsterdam*, 1900, 2, 618—634).—Rayman and Šulc (Abstr., 1897, ii, 136) have shown that solutions of cane sugar in very pure water undergo inversion with a steadily increasing velocity, and Kullgren finds, further, that non-electrolytes, such as glycerose and sucrose, exert a retarding influence on the hydrolysis of ethyl acetate by sodium hydroxide, due probably to the formation of a sodium derivative of the sugar. The author has extended these investigations on the apparent acidic nature of the sugars, by studying the effect of sucrose, invert sugar, dextrose, lævulose, and mannitol on the velocity of hydrolysis of $N/40$ ethyl acetate by $N/40$ sodium hydroxide at 25°.

The following table gives the velocity constants for various concentrations of the different sugars, the value for pure water being 6.86 :

	Concentration of Sugar.				
	N/5.	N/10.	N/20.	N/40.	N/80.
Sucrose	2.01	3.12	4.29	5.19	5.88
Invert sugar	0.38	0.67	1.17	2.03	3.38
Dextrose	0.79	1.37	2.32	3.69	4.79
d-Lævulose	0.59	1.02	1.88	3.04	4.27
Mannitol.....	5.17	5.85	6.18	6.40	6.81

Thus, whilst mannitol resembles methyl and ethyl alcohols (Kullgren) in exerting but a slight influence on the velocity of hydrolysis, the sugars, on the other hand, have a considerable retarding effect.

T. H. P.

Action of Bromine on Phenylsulphonacetic Acid and α -Phenylsulphonpropionic Acid in Aqueous Solution : a Contribution to Chemical Kinetics. By LUDWIG RAMBERG (*Zeit. physikal. Chem.*, 1900, 34, 561—592).—Bromine reacts with phenylsulphonacetic acid in several stages ; the first two of these, consisting in the formation of mono- and di-bromophenylsulphonacetic acids, takes place with velocities which are approximately in the ratio 1.6 : 1. When the concentration of the bromine is high and the halogen is in excess, the reaction velocity is nearly proportional to the product of the concentration of the reacting acid and the square root of the bromine concentration. When the bromine concentration is low, the reaction velocity is proportional to the product of the concentrations of the reacting substances ; the lower the concentration, the more accurately does this rule apply. In explanation of the somewhat complicated phenomena, the author supposes that the bromine molecules in the solution are split into atoms to an extent depending on the concentration, and that only these atoms take part in the reaction.

The reaction between bromine and α -phenylsulphonpropionic acid, which is a case of simple substitution, has also been studied. The reaction velocity is found to depend in the same manner as above on the concentrations of the reacting substances. The relative velocity of the reactions becomes greater with increasing dilution.

The paper contains also a short account of the action of iodine on phenylsulphonacetic acid, and the formation therefrom of phenyl-diiodomethylsulphone. The reaction does not lend itself to investigation on the lines indicated above.

J. C. P.

Physical Condition of Substances Insoluble in Water formed in Gelatin. By CORNELIS A. LOBBY DE BRUYN (*Rec. Trav. Chim.*, 1900, 19, 236—249).—Details of work already published (this vol., ii, 136).

N. L.

G. Linck's Crystallographic Views. By GOTTLÖB LINCK (*Ber.*, 1900, 33, 2284—2287).—The author replies to the criticisms of Muthmann (this vol., ii, 533) by quoting a number of observations to prove the validity of his crystallographic method for correcting atomic weights.

E. G.

Laboratory Apparatus. By FREDERICK W. STREETFELD and FRANK SOUTHERDEN (*Chem. News*, 1900, 82, 56).—To aid in the distillation of substances which tend to solidify in the condenser, a second tube is passed through the inner tube; into this steam can be admitted when any obstruction is threatened.

A second apparatus is to serve for drying substances in a current of hot air previous to taking the melting points. The substance is placed on a piece of drying paper in the horizontal limb of a piece of bent combustion tube held in a clamp, the other limb is turned downwards at an angle of 140° and is heated by a Bunsen burner. The temperature can be adjusted by manipulating the flame, and is recorded and controlled by a thermometer suspended horizontally with the bulb just above the substance. D. A. L.

Modification of the Water Vacuum Pump. By MARTIN H. ITTNER (*Amer. Chem. J.*, 1900, 24, 253—255).—The author has devised an improved form of the water-pump, which has been found to be well adapted for distillation under low pressures. The most important point is that the water supply is drawn from a large bottle, the water level in which is kept constant, so that no water will be drawn back into the vessel which is being exhausted and the pressure is not liable to variation by bubbles of air being carried over into the pump with the water. For details, the diagram in the original must be consulted. E. G.

Economical Constant Gas Generator. By GEORG AUGUST KOENIG (*Zeit. anal. Chem.*, 1900, 39, 508—511).—This generator is designed both to check the waste of hydrogen sulphide which occurs in many laboratories and to furnish the gas instantly even when the laboratory temperature is too low for dilute sulphuric acid to react with ferrous sulphide. The ferrous sulphide is contained in a tubular vessel with a water jacket which is kept at 80° by a small flame. The acid drops in at the top of the generator from a stopcock thistle funnel. This funnel can be replenished from a reservoir, but if made to hold 50 c.c. and supplied with $N/2$ acid, a single filling suffices for almost any qualitative reaction. The neutralised acid flows away by a wide-bore stopcock and rubber tube at the lower end of the generator; only about 5—8 per cent. of the acid escapes neutralisation. M. J. S.

Inorganic Chemistry.

Influence of Finely Divided Platinum on the Combination of Hydrogen and Oxygen. By WILLIAM FRENCH (*Chem. News*, 1900, 81, 292—294. Compare *Proc.*, 1897, 13, 52).—Experiments are described in which oxygen and hydrogen in electrolytic mixture and thoroughly dried did not combine when exposed to dry platinum sponge, although the same mixture exploded when ignited or when

brought into contact with moist platinum sponge especially in presence of light. D. A. L.

Action of Permanganate on Hydrogen Peroxide and on Caro's Acid. By ADOLF VON BAEYER and VICTOR VILLIGER (*Ber.*, 1900, 33 2488—2497).—Berthelot, who noticed that, when a dilute sulphuric acid solution of potassium permanganate is added to hydrogen peroxide at -12° , the colour of the mixture disappears without the evolution of oxygen, attributed this result to the formation of the peroxide H_2O_3 (*Abstr.*, 1880, 444). This explanation, however, is incorrect, the phenomenon being one of supersaturation; the gas is readily evolved on shaking the solution and the rate of evolution depends on the temperature; the time required for the liberation of the theoretical amount at -16° is 20 minutes, whilst at $+15^{\circ}$ this velocity is doubled.

A given quantity of potassium permanganate evolves more oxygen when mixed with Caro's acid than with hydrogen peroxide. Bach supposed that this was due to the existence of a higher peroxide H_2O_4 (this vol., ii, 470). This view of the reaction is erroneous, the result being due to a catalytic decomposition of Caro's acid. The amounts of oxygen evolved vary with the temperature and at 0° , 18° , and 34° they are equal, respectively, to 2.5, 3.5, and 4.5 times the volume of the gas evolved from hydrogen peroxide. The Caro's acid employed by Bach consisted of a mixture of this reagent with hydrogen peroxide; the latter substance first reduces a portion of the permanganate to manganous sulphate, a portion of the Caro's acid then oxidises this salt to manganic sulphate, the peroxidised salt subsequently acting catalytically on the remainder of the oxidising agent decomposing it with the evolution of oxygen. This catalytic decomposition of Caro's reagent depends on the presence of manganous sulphate, an acid solution of potassium permanganate having no immediate action on pure Caro's acid; excess of the proto-salt, however, exercises a retarding influence, and when it is added to the reacting mixture at the commencement of the experiment, the time required to complete the decomposition is 3 hours instead of 20 minutes.

The paper contains a discussion of the explanations put forward by Schönbein, by Weltzien and Traube, and by Berthelot to account for the reaction between hydrogen peroxide and permanganic acid.

Pure Caro's acid is prepared by triturating potassium persulphate with concentrated sulphuric acid and pouring the mixture on to chopped ice; the solution thus produced is shown to be free from hydrogen peroxide by testing with titanousulphuric acid. A dilute sulphuric acid solution of Caro's acid and potassium permanganate may be employed in testing the relative stability of organic compounds towards oxidising agents. The liquid paraffins ("Benzin") decolorise the solution very slowly, hexamethylene more rapidly, and benzene immediately.

Oxalic and succinic acids are exceedingly stable towards this reagent whilst phthalic and adipic acids are rapidly attacked. G. T. M.

Autoxidation. By FRITZ HABER (*Zeit. physikal. Chem.*, 1900, 34, 513—521).—A discussion of the theory of oxidation both in absence and in presence of water. The equation $O_2 + 2H_2O \rightleftharpoons 2H_2O_2$ is resolved into the two others: (1) $O_2 \rightleftharpoons O + O$, (2) $O_2 + H_2O \rightleftharpoons H_2O_2 + O$. These two equations indicate the connecting link between the phenomena of oxidation in presence of water and those in absence of water. The slowness of many reactions in absence of water is then to be accounted for by the different reaction velocities of the equations (1) and (2). The author treats the subject also from the purely dynamical point of view.

J. C. P.

Autoxidation. II. By FRITZ HABER and FR. BRAN (*Zeit. physikal. Chem.*, 1900, 35, 81—93).—Ostwald has attributed autoxidation to the formation of intermediate peroxides, and has shown that the two processes must be capable of expression by definitely connected equations. The author shows that this is the case if autoxidation in the presence of water is attributed to the formation of hydrogen peroxide, and in all the cases examined (namely, the following pairs, sodium sulphite and sodium arsenite, sodium sulphite and nickelous hydroxide, indigo and benzaldehyde, triethylphosphine and indigo, potassium ferrocyanide and benzaldehyde), one of the compounds is reactive with hydrogen peroxide, whilst the other is not. The equations representing the oxidation may be written $M + O_2 + H_2O = MO + H_2O_2$; $M + H_2O_2 = M(OH)_2$ (compare this vol., ii, 593, and preceding abstract).

L. M. J.

Change in Composition of Liquid Air on Evaporation. By A. A. GROUSINOFF (*J. Russ. Phys. Chem. Soc.*, 1900, 32, ii, 107—114).—Liquid air, obtained from Linde's apparatus, was allowed to evaporate from a Dewar vacuum tube, the gas formed being collected and analysed. The results show that the law expressing the change in composition of liquid air on evaporation is independent of the speed of evaporation. From the numbers obtained, curves are constructed showing the variation of the percentage of oxygen with the proportion of the air evaporated, and also the percentage of oxygen at any time during the evaporation. These curves show that the liquid air prepared by Linde's apparatus contains 32.5 per cent. of oxygen which is reduced to the normal proportion (21 per cent.) after 40 per cent. of the liquid has evaporated.

T. H. P.

Nature of the Accessory Combustible Gases in the Air of Paris. By ARMAND GAUTIER (*Compt. rend.*, 1900, 131, 535—539).—The ratio of carbon to hydrogen in the products of combustion of the air of Paris, after the hydrogen present in the free state (this vol., ii, 537, 538) has been taken into account, is always higher than that corresponding with methane. The reaction with iodic anhydride shows that this highly carburetted gas is not an olefine or an acetylene, and it is therefore in all probability benzene and its analogues, or some of the pyrogenic hydrocarbons. Assuming it to be benzene, the combustible constituents in 100 litres of Paris air are,

on an average, hydrogen, 19.5 c.c.; methane, 12.1 c.c.; benzene and its analogues, 1.7 c.c.; carbon monoxide with traces of olefines and acetylenes, 0.2 c.c.

C. H. B.

Formation of Ozone by a Point-discharge in Oxygen. By EMIL WARBURG (*Sitzungsber. k. Preuss. Akad. Wiss.*, 1900, 712—721).—A formula is deduced for the rate of formation and decomposition of ozone by means of a point-discharge in oxygen, and has been verified by experiments carried out in a 'differential ozonometer' in which the amount of ozone produced is determined from the decrease or increase of pressure. The maximum percentage of ozone by volume was found to be 5.74 at -71° , 4.19 at 0° , 3.53 at 17° , 2.22 at 50° , and 1.23 at 93° , and the rates at which the ozone is produced and decomposed at each of these temperatures were determined separately by measuring the velocity of change. In a second series of experiments, a negative point-discharge was found to give about three times as much ozone as a positive discharge at 0° , 19° , and 48° . T. M. L.

Ozone. IV. By ALBERT LADENBURG (*Ber.*, 1900, 33, 2282—2284).—A reply to Brunck (this vol., ii, 572), who has recently cast doubt on the validity of the author's determinations of the molecular weight of ozone.

E. G.

Molecular Weight and Vapour Density of Sulphur. By OTTO BLEIER and LEOPOLD KOHN (*Monatsh.*, 1900, 21, 575—620).—As the numbers previously obtained (this vol., ii, 203) do not exclude the possibility that the sulphur molecule is greater than S_8 , and that at the temperatures employed, partial dissociation had occurred, further series of determinations have been made. They show that at the same temperature but with slight increments in pressure the density of sulphur vapour gradually approaches the value eight, but so gradually that it never actually reaches it. As this has been proved for several temperatures it is concluded that the molecule of sulphur must contain eight atoms. The authors claim that their method for vapour density determinations of dissociated vapours under reduced pressure is free from the serious objections which have been raised against the V. Meyer method.

The sulphur obtained in the apparatus at the end of the experiments is the modification insoluble in carbon disulphide, but at the higher temperatures, namely, in diphenylamine vapour and occasionally in amyl benzoate vapour under reduced pressure and in an atmosphere of nitrogen, a black modification of sulphur with a high metallic lustre has been observed. This variety is only slowly volatile, burns with a bright luminous flame, and is less brittle than yellow sulphur. It is possible that it is identical with the substance known as Magnus's black sulphur or with the modification of sulphur described by Dietzenbacher (*Compt. rend.*, 1863, 56, 39), and there is a further possibility that it may contain organic matter.

After determinations in amyl benzoate vapour, part of the sulphur is often left as clear, oily drops, which solidify when touched.

J. J. S.

Action of Alkaline Hydroxides, of Water and of Hydrogen Peroxide on Nitrogen Iodide. By F. D. CHATTAWAY and K. J. P. ORTON (*Amer. Chem. J.*, 1900, 24, 318—330. Compare Proc., 1899, 15, 18).

Action of Acids on Nitrogen Iodide. By F. D. CHATTAWAY and H. P. STEVENS (*Amer. Chem. J.*, 1900, 24, 331—341. Compare Proc., 1899, 15, 19).

Formation and Constitution of Nitrogen Iodide. By F. D. CHATTAWAY and K. J. P. ORTON (*Amer. Chem. J.*, 1900, 24, 342—355. Compare Proc., 1899, 15, 20).

Condition of Nitrous Acid in Aqueous Solutions. By A. V. SAPOSCHNIKOFF (*J. Russ. Phys. Chem. Soc.*, 1900, 32, 375—381).—At 0°, aqueous solutions of nitrous acid are stable but on heating, gradual decomposition takes place according to the equation: $3\text{HNO}_2 = \text{HNO}_3 + 2\text{NO} + \text{H}_2\text{O}$. The author has investigated the rate of this decomposition and also the conditions of equilibrium of aqueous nitrous acid in an atmosphere of nitric oxide, but no equilibrium constant could be determined. On mixing chloroform with an aqueous solution of nitrogen trioxide, the latter becomes distributed between the two solvents but the concentration ratio has not a constant value. T. H. P.

Reaction of Nitroso-derivatives. By ANGELO ANGELI and FRANCESCO ANGELICO (*Atti Real. Accad. Lincei*, 1900, [v], 9, ii, 44—46. Compare this vol., ii, 594).—The ready resolution of nitrohydroxylaminic acid into nitrous and hyponitrous acids which is brought about by the action of aldehydes or of metallic sulphites, is further exemplified by the action of nitroso-derivatives in which the nitrogen atom is tervalent in function. Thus nitrosobenzene is readily dissolved by an aqueous solution of sodium nitrohydroxylamine, yielding the sodium salts of nitrous acid and of nitrosophenylhydroxylamine. T. H. P.

Reduction of Nitrates by Lactic Acid. By LUDWIG VANINO and O. HAUSER (*Zeit. anal. Chem.*, 1900, 39, 506—507).—The dry nitrates of bismuth, mercury (both mercurous and mercuric), cadmium, silver, lead, cobalt, and nickel, are decomposed, with separation of the respective metals, when heated with lactic acid. The chlorides and sulphates of the same metals show no reduction, neither do the nitrates of aluminium, the alkaline earths, and alkalis. Ferric nitrate gives a black magnetic powder, but whether this is metallic iron has not been ascertained. M. J. S.

Preparation of Phosphorus Free from Arsenic. By EMILIO NOELTING and W. FEUERSTEIN (*Ber.*, 1900, 33, 2684—2685).—By distilling ordinary phosphorus twice with steam in a current of carbon dioxide, a product is obtained, which, on conversion into the red modification, and treatment with ammonium nitrate, yields no trace of arsenic; Winkler's view (this vol., ii, 476) as to Fittica's supposed transformation of phosphorus into arsenic is thus confirmed.

W. A. D.

Composition of Soot from Mineral Coal. By H. WARTH (*Chem. News*, 1900, 82, 6).—The aqueous extract of the soot on evaporation gave a very hygroscopic mass; the ammonium salts were sublimed from it, and the residue was lixiviated with water to ascertain the proportion of fixed salts. The numbers obtained were: ammonium sulphate, 0.1; ammonium chloride, 7.3; non-volatile soluble salts, 1.3 per cent. of the original soot. D. A. L.

Krypton. By ALBERT LADENBURG and O. KRÜGEL (*Sitzungsber. K. Preuss. Akad. Wiss.*, 1900, 727—728. Compare this vol., ii, 540).—No simpler method of preparing krypton has yet been found than that already described (*loc. cit.*), and the 32 c.c., or 0.083 gram, isolated from 850 litres of liquid air probably represents the normal proportion of the gas in the atmosphere, which would thus be about 0.00001 per cent. The semi-solid residue from 3 litres of liquid air, when freed from carbon dioxide, nitrogen, and oxygen, gave a residue of argon but no krypton.

The density of the gas when purified by a further fractionation gave the value 59.01 for the molecular weight ($O_2 = 32$), confirming the earlier values and the hypothesis as to the position of krypton in the periodic system. T. M. L.

Action of Chlorine on Metallic Silver in the Light and in the Dark. By V. VON CORDIER (*Monatsh.*, 1900, 21, 655—670. Compare this vol., ii, 343).—Red light does not facilitate the union of chlorine and silver, but blue and violet light favour the combination, although in the latter cases reduction is also accelerated.

Light which has traversed a sufficiently thick layer of chlorine behaves very similarly to red light; the result depends largely on whether the chlorine used for filtering the light is dry or moist; if dry, the action is pretty much the same as when white light is used, but if the light is passed through moist chlorine a considerable diminution in the activity of combination is noticeable. The difference is even greater if a little hydrogen is added to the moist chlorine. Röntgen rays have no perceptible influence on the combination of chlorine and silver. J. J. S.

Some Complex Silver Salts. By KARL HELLWIG (*Zeit. anorg. Chem.*, 1900, 25, 157—188).—Silver iodide and nitrate exist in common solution as a complex salt; this is shown by the lowering of the boiling point due to the addition of the iodide to a solution of the nitrate. The solubility of the iodide in solutions of the nitrate has been determined, and the values obtained have been used in applying the law of mass action to the dissociation of the double salt; in this, experiment agrees fairly well with theory, although the presence of other complex salts than $Ag_3I(NO_3)_2$ seems to introduce a disturbing factor. When this double salt is electrolysed, the silver iodide is found to migrate to the cathode—a case of a complex cation. The solubilities, at 25° in 3*N* silver nitrate solution, of silver iodide,

bromide, chloride, cyanide, and thiocyanate are respectively 9.4, 2.13, 5.6, 9.1, 2.6 millimolecules per litre.

The tendency of insoluble silver salts to form complex anions has also been investigated. The solubility of these salts in the corresponding alkali salts is greatest for the cyanide, followed by the thiocyanate, iodide, bromide, and chloride. The author's observations are in good agreement with Abegg and Bodländer's theory (Abstr., 1899, ii, 542) regarding the formation of complex ions.

The existence of the following double salts in solid form has been confirmed: $\text{Ag}_3\text{I}(\text{NO}_3)_2$, Ag_2INO_3 , Ag_2BrNO_3 , $\text{Ag}_3\text{CN}(\text{NO}_3)_2$, K_2AgI_3 , KAgI_2 , $\text{KAg}(\text{CNS})_2$. The double salt, $\text{Ag}_3\text{CNS}(\text{NO}_3)_2$, has been prepared for the first time.

J. C. P.

Silver Peroxysulphate and Peroxyacetate. By EDUARD MULDER (*Rec. Trav. Chim.*, 1900, 19, 115—165. Compare Abstr., 1896, ii, 561; 1897, ii, 260 and 551; 1899, ii, 483).—The first part of this paper is devoted to a detailed consideration of the preparation and properties of silver peroxysulphate, of which a short account has already been given (Abstr., 1899, ii, 483). The influence of experimental conditions on the yield and purity of the compound is discussed, and the factors of prime importance are shown to be the strength of the current, the concentration of the solution, the rate at which the solution is neutralised during the electrolysis, and the time. Details are then given of the analysis and products of decomposition of a number of different preparations, and some modifications and improvements in the various processes are described. The use of two filters is found advisable, the first containing silver carbonate to neutralise the free acid formed during electrolysis, whilst the second contains silver sulphate, whereby the concentration of the solution is maintained. The formation and decomposition of silver peroxysulphate are theoretically discussed, an analogy is drawn between oxysulphuric and persulphuric acids, and a structural formula for the former is suggested. Remarks are also made on the action of persulphuric acid on hydrogen peroxide, the behaviour of silver peroxide, peroxysulphate, and peroxy-nitrate as oxidising agents, the separation of oxynitric and oxysulphuric acids by dialysis, the rate of spontaneous decomposition of silver peroxysulphate and peroxy-nitrate, experiments on the yield of the latter salt as a function of the time, and the separation of silver nitrate and sulphate by means of alcohol. The general question of the formation of compounds of silver salts of oxoacids with silver peroxide is considered.

In the second part of the paper, an account is given of a preliminary series of experiments on the electrolysis of silver acetate. The most favourable conditions for the formation of the product at the anode are difficult to determine, and the analyses thereof are as yet incomplete, but the production of a compound of the general composition $x\text{Ag}_2\text{O}_3, y(\text{AgOAc}, z\text{O})$, analogous to the peroxysulphate and peroxy-nitrate, is regarded as demonstrated. In the preparation of this substance, silver oxide is found to be better adapted than the carbonate for the neutralisation of the free acid formed. It is suggested that the further investigation of silver peroxyacetate will throw light on

the phenomena of the electrolysis of the salts of organic acids in general. N. L.

Solubility of Calcium Carbonate in Sea-water. By ERNST COHEN and H. RAKEN (*Proc. K. Akad. Wetensch. Amsterdam*, 1900, 3, 63—66).—Artificial sea-water, free from calcium carbonate, was agitated with this substance by means of a current of air, and excess of carbon dioxide subsequently expelled by a current of air free from this gas. In eight days, calcium carbonate corresponding with 53.94 milligrams, and in seventeen days with 57.27 milligrams of combined carbon dioxide per litre, was dissolved at 15°. Sea-water, which contains 52.8—55 milligrams of neutral combined carbon dioxide per litre, must therefore be saturated with calcium carbonate. G. T. M.

Orthoplumbates of the Alkaline Earths. IV. Lead "Peroxide." By GEORG KASSNER (*Arch. Pharm.*, 1900, 238, 449—458. Compare Abstr., 1899, ii, 657).—Calcium perplumbate, already obtained from the metaplumbate, can also be obtained from the crystallised orthoplumbate, $\text{Ca}_2\text{PbO}_4 \cdot 4\text{H}_2\text{O}$, by heating it, best in a current of oxygen, but also in a current of nitrogen or in a vacuum; its formation is due to an intramolecular transformation or oxidation. The temperature employed should be about 260—280°, and the heating should not be continued too long (about 2 hours suffice). C. F. B.

Some Isomeric Halogen Compounds of Thallium and the Constitution of Double Salts. By ALLERTON S. CUSHMAN (*Amer. Chem. J.*, 1900, 24, 222—242).—When thallous chloride is shaken with bromine and water, and afterwards dissolved in boiling water acidified with nitric acid, the compound, $\text{TlClBr}_2 \cdot 3\text{TlCl}$, separates on cooling in orange-coloured, hexagonal plates.

If thallous bromide is suspended in hot water and treated with solution of thallic chloride, the compound, $\text{TlCl}_3 \cdot 3\text{TlBr}$, is deposited in orange, hexagonal plates; under similar conditions, thallous chloride unites with thallic bromide to form an isomeric compound, $\text{TlBr}_3 \cdot 3\text{TlCl}$, which dissolves on boiling, and, if the solution is rapidly cooled, is obtained in blood-red, hexagonal crystals. The former compound is very stable, and can be crystallised from water unchanged; its red isomeride, on the other hand, is very unstable and easily decomposed by water. If the orange compound, $\text{TlCl}_3 \cdot 3\text{TlBr}$, is treated with excess of thallic chloride, the sesquichloride, $\text{TlCl}_3 \cdot 3\text{TlCl}$, is produced, whilst by the action of thallic bromide, long, yellow needles of the double salt, $\text{TlBr}_3 \cdot \text{TlCl}$, are obtained, which on recrystallisation from water are converted into dark red crystals of $\text{TlBr}_3 \cdot 3\text{TlCl}$. In the process of preparing the red compound by the action of thallous chloride on thallic bromide, it was found possible, by varying the dilution, to obtain directly the yellow needles, $\text{TlBr}_3 \cdot \text{TlCl}$, the orange compound, $\text{TlCl}_3 \cdot 3\text{TlBr}$, or the red compound, $\text{TlBr}_3 \cdot 3\text{TlCl}$.

In order to elucidate the constitution of these double salts, determinations were made of the electrical conductivity of solutions of the thallium chlorides and bromides; the results "appear to find a more rational explanation under Werner's hypothesis than under the old linkage theory." E. G.

Preparation and Properties of Neodymium and Praseodymium Carbides. By HENRI MOISSAN (*Compt. rend.*, 1900, 131, 595—600. Compare Abstr., 1896, ii, 422).—*Neodymium carbide*, NeC_2 , prepared by gently calcining a compressed cylindrical mass of neodymium oxide, Ne_2O_3 , and sugar carbon moistened with turpentine until combustible gases are no longer evolved, and then heating the residue for four minutes in the electric furnace by means of a current of 900 amperes and 50 volts, is obtained in the form of yellow, hexagonal plates of sp. gr. 5.15.

Praseodymium carbide, PrC_2 , produced in similar manner by substituting praseodymium oxide, PrO_2 , for the neodymium compound in the above experiment, closely resembles the preceding carbide; it has a sp. gr. 5.10.

These substances are not reduced by hydrogen at a red heat. Nitrogen or ammonia attacks the carbides at 1200° , the former gas forming nitrides and the latter a mixture of hydrides and nitrides; the product in the second case evolves hydrocarbons and ammonia on treatment with water.

When the carbides are greatly warmed in fluorine, a vigorous action takes place accompanied by incandescence; the resulting fluorides are insoluble in water, and somewhat infusible and non-volatile. The halogens act on the carbides only at red heat, the intensity of the action diminishing from chlorine to iodine; the anhydrous haloid salts produced are all soluble in water. A soluble product is likewise obtained by the action of hydrogen chloride at a dull red heat. When heated at 400° in a current of oxygen, neodymium carbide is completely decomposed, leaving a mauve oxide; praseodymium carbide, when similarly treated, yielding a black oxide. Sulphur and hydrogen sulphide, at temperatures between 400° and 1000° give rise to sulphides which are decomposed by water or dilute acids. Carbon readily dissolves in the fused carbides, and the cooled product presents a fracture similar to that of plumbago owing to the presence of graphite crystals.

Water decomposes these carbides as readily as those of cerium, lanthanum, and yttrium, a mixture of gaseous hydrocarbons being evolved, whilst the residue consists of liquid and solid hydrocarbons and hydrated oxides. The composition of the gaseous mixture is very similar in both cases, the gas consisting of acetylene (65 to 68 per cent), olefines (2.5 to 7 per cent.), and paraffins (27 to 30 per cent.). Hot concentrated sulphuric acid is reduced by the carbides yielding sulphur dioxide. Dilute nitric acid rapidly oxidises these compounds, yielding the metallic nitrates; the concentrated acid has no action on them.

The carbides of the cerium group of metals evolve a mixture of hydrocarbons, and differ markedly from those of alkaline-earth series which yield acetylene only, and also from aluminium carbide, which furnishes methane.

G. T. M.

Hydroxides of Aluminium. By EUGENE T. ALLEN (*Chem. News*, 1900, 82, 75—76).—The author is of opinion that precipitated alumina has the composition $\text{Al}(\text{OH})_3$, whether prepared by pre-

precipitating warm or in the cold with ammonia, by boiling a soluble aluminate with ammonium chloride, by boiling the basic carbonate with water or dilute ammonia, or by the prolonged action of water on soluble aluminates. The last form is crystalline and does not lose water over sulphuric acid; the amorphous varieties under such conditions, or by heating at 100° , lose a mol. of water leaving the hydrate, $\text{Al}_2\text{O}_3\cdot\text{H}_2\text{O}$, which is hygroscopic and reverts to $\text{Al}(\text{OH})_3$.

D. A. L.

Action of Caustic Hydroxides on Aluminium. By EUGENE T. ALLEN and H. F. ROGERS (*Amer. Chem. J.*, 1900, 24, 304—318).—On dissolving aluminium in an excess of 10 per cent. aqueous potassium hydroxide, and evaporating the solution in a vacuum over sulphuric acid, the aluminate, $\text{K}_2\text{Al}_2\text{O}_4\cdot 3\text{H}_2\text{O}$ (Fremy, *Ann. Chim. Phys.*, 1844, [iii], 12, 362) separates in hard, nodular crystals; if the alkali is not in excess, hydrolysis of the aluminate occurs and crystalline aluminium hydroxide is deposited, whilst the metal continues to dissolve indefinitely instead of in the proportion demanded by Cavazzi's equation, $2\text{KOH} + 2\text{Al} + 2\text{H}_2\text{O} = \text{K}_2\text{Al}_2\text{O}_4 + 3\text{H}_2$ (Abstr., 1885, 1112).

A solution of aluminium in aqueous sodium hydroxide does not crystallise on evaporation, but on repeatedly digesting with alcohol a hard mass of *sodium aluminate*, $\text{Na}_2\text{Al}_2\text{O}_4\cdot 4\text{H}_2\text{O}$, is obtained. *Lithium aluminate*, $\text{LiHAl}_2\text{O}_4\cdot 5\text{H}_2\text{O}$, obtained in similar manner, is a light, micro-crystalline powder, sparingly soluble in water, by which it is decomposed only after continued boiling; one preparation contained 3 instead of $5\text{H}_2\text{O}$, but an aluminate of a different type could not be obtained.

Aluminium dissolves vigorously in hot concentrated aqueous barium hydroxide, yielding the aluminate $\text{Ba}_2\text{Al}_2\text{O}_6\cdot 5\text{H}_2\text{O}$, as a heavy crystalline, moderately soluble powder, somewhat easily decomposed by water (compare Beckmann, Abstr., 1889, 289 and 649); in the cold, the compound, $\text{BaAl}_2\text{O}_4\cdot 5\text{H}_2\text{O}$ (Beckmann gives $6-7\text{H}_2\text{O}$), is obtained, as a soft, white, apparently amorphous powder, which is easily decomposed by water and by carbon dioxide.

When aluminium is boiled with concentrated, aqueous strontium hydroxide, hydrogen is evolved for a moment, but no further action then occurs; in the cold, the metal dissolves and the *aluminate*, $\text{Sr}_2\text{Al}_2\text{O}_6\cdot 6\text{H}_2\text{O}$, separates. The latter is better obtained by adding a solution of potassium aluminate containing an excess of potassium hydroxide to a hot solution of strontium chloride or hydroxide; it forms a white, heavy, granular, crystalline powder sparingly soluble in water, by which it is only slowly decomposed, and sensitive to the action of carbon dioxide. A second *aluminate*, $\text{SrAl}_2\text{O}_4\cdot 4-5\text{H}_2\text{O}$, closely resembling the second barium aluminate may also be formed in the action of strontium oxide on aluminium, but could not be obtained pure; it forms a glutinous mass.

Calcium aluminate, $\text{Ca}_2\text{Al}_2\text{O}_6\cdot 7\text{H}_2\text{O}$, obtained by dissolving aluminium in lime-water kept saturated with the hydroxide, is a dense, white, crystalline substance, with a pearly lustre; it is only slowly decomposed by water, in which it is very sparingly soluble. On adding aqueous potassium aluminate to hot lime-water, a crystalline

precipitate of the compound $\text{Ca}_3\text{Al}_2\text{O}_6 \cdot 6\text{H}_2\text{O}$ is obtained; it closely resembles the corresponding strontium compound. W. A. D.

Aluminates. By W. HERZ (*Zeit. anorg. Chem.*, 1900, 25, 155—156).—Alkali aluminates of the formula Na_3AlO_6 and K_3AlO_6 are obtained in solution by shaking excess of aluminium hydroxide (prepared by precipitation with ammonia and dried in a vacuum desiccator) with solutions of alkali hydroxides of varying strength.

E. C. R.

Crystallised Monocalcium Aluminate. By ÉMILE DUFAU (*Compt. rend.* 1900, 131, 541—544).—When alumina which has been strongly ignited is heated in the electric furnace with 60 per cent. of its weight of calcium oxide, *calcium aluminate*, $\text{CaO} \cdot \text{Al}_2\text{O}_3$, is obtained in colourless, transparent needles softer than glass and of sp. gr. 3·671 at 20°. It is decomposed by water, but does not "set," and is readily attacked by hydrochloric acid but not by nitric, sulphuric, or hydrofluoric acid. Fluorine attacks it only on heating, but chlorine, bromine, iodine, or sulphur has no action on it at the softening point of glass. When heated with carbon in the electric furnace, it yields two distinct carbides. Attempts to prepare polycalcium aluminates in the electric furnace gave negative results.

It is noteworthy that this calcium aluminate like the analogous beryllium compound, and like calcium chromate and calcium ferrite, does not belong to the group of the spinels. C. H. B.

Iron and Hydrogen. By E. HEYN (*Chem. Centr.*, 1900, ii, 621—622; from *Stahl. u. Eisen*, 20, 837—844).—When cast iron is heated at 730—1000° in contact with hydrogen and then chilled, it becomes considerably more brittle than when similarly heated in air and chilled. If, however, the metal is allowed to cool slowly in hydrogen, it remains tough, and at temperatures below 730° its properties are not affected by hydrogen. A cast iron containing 0·37 per cent. of carbon was found to behave in the same way as one containing only 0·05 of carbon and 0·01 of silicon. By heating the metal in nitrogen at a red heat, the effect of the treatment with hydrogen is destroyed, and in one experiment at a temperature of 820° hydrogen equal to 0·00019 per cent. of the weight of the iron was liberated. In the case of iron containing very little carbon, the brittleness is partly removed by heating in boiling water, or even by long exposure to the air at the ordinary temperature, and is completely destroyed by heating at 200—250°. Iron containing more carbon retains its properties much more obstinately. A superficial layer after treatment with hydrogen was found to show a greater flexibility, hence the hydrogen must penetrate below the surface. The density of the metal is not affected by the treatment with hydrogen. The change cannot be ascribed to silicon taken up from the porcelain tubes in which the metal was heated, for the same result is obtained when iron tubes are employed. E. W. W.

Iron and Steel from the Standpoint of the Phase Rule. By H. W. BAKHUIS ROOZEBOOM (*Zeit. physikal. Chem.*, 1900, 34, 437—487).—The author gives an exhaustive theoretical treatment of

the subject, comparing his conclusions, where possible, with the results obtained by Roberts-Austen and others. In developing the theory, much use is made of the facts recently established in connection with the formation and transformation of mixed crystals. The scheme deduced by the author as representing the equilibria in iron-carbon mixtures of varying composition and at different temperatures can be given only in outline.

Mixtures containing 0—2 per cent. of carbon solidify to homogeneous mixed crystals—martensite; mixtures with 2—4·3 per cent. of carbon solidify to a framework of these mixed crystals, surrounded by a eutectic product, consisting of mixed crystals and graphite; mixtures with more than 4·3 per cent. of carbon solidify to a framework of graphite crystals, surrounded by the eutectic product. On cooling below the solidifying temperature, the alloys with more than 2 per cent. of carbon undergo a separation of carbon between 1130° and 1000°, and at the latter temperature martensite and graphite are transformed into carbide or cementite (Fe_3C); so long as the carbon percentage is less than 6·6, this results in a conglomerate of martensite and cementite. The formation of the latter continues progressively down to 690°; during this interval, the martensite crystals become poorer in carbon, and contain ultimately no more than 0·85 per cent. They disappear at 690° and are transformed into α -iron (or ferrite) and cementite. Any deviations from this normal behaviour are to be regarded as due to unequal rate of cooling; it is certain that with rapid cooling cementite is formed at once, and that in the formation of cementite from the martensite and graphite, a portion of the latter always escapes transformation. Alloys with 2·0—0·85 per cent. carbon separate cementite between 1000° and 690°, resolving themselves at the latter temperature into cementite and ferrite. These changes may, however, fail to take place when the cooling is rapid, in which case the martensite crystals would be permanent. Alloys with 0—0·35 per cent. carbon gradually separate β -iron between 890° and 770°; at 770°, the β -iron is completely transformed into α -iron, and afterwards there takes place a gradual separation of α -iron from the mixed crystals remaining at 770°. Alloys with 0·35—0·85 per cent. carbon separate α -iron only between 770° and 690°. In all alloys with 0—0·85 per cent. carbon, a transformation of the remaining martensite crystals into ferrite and cementite takes place at 690°, although rapid cooling may prevent it. So far as published results go, it is possible to give another scheme of the changes taking place in alloys with 0—0·85 per cent. carbon, on the supposition that carbon is slightly soluble in β - and α -iron. In the author's scheme, a place is found for austenite, which is regarded as a mass of mixed crystals separating themselves from concentrated liquid solutions. Several points in the author's scheme tend to show that carbon is monatomic in solution, but the question is not definitely settled. The question of the diffusion of carbon in iron is also discussed.

J. C. P.

Iron Silicide, Fe_2Si , and its presence in Ferro-silicons. By PAUL LEBEAU (*Compt. rend.*, 1900, 131, 583—586).—Iron silicide,

Fe_2Si , is obtained by strongly heating iron with twice its weight of commercial copper silicide containing 10 per cent. of silicon, the product being treated with nitric acid (1:10) and purified in the usual way. It forms long, brilliant, grey crystals with octahedral terminations. In sp. gr. and chemical properties, it is identical with the silicide obtained by Moissan in the electric furnace (Abstr., 1896, ii, 173), and it can be isolated from commercial ferro-silicons which contain 10 to 20 per cent. of silicon and have been prepared at a high temperature.

C. H. B.

Nickel Selenides. By HENRI FONZES-DIACON (*Compt. rend.*, 1900, 131, 556—558).—*Nickel selenide*, NiSe , is obtained in regular double tetrahedrons by the action of selenium vapour diluted with nitrogen on nickel at a dull red heat, and also by the action of hydrogen selenide on anhydrous nickel chloride at a bright red heat. *Nickel sesquiselenides*, Ni_2Se_3 and Ni_3Se_4 , are obtained by the action of hydrogen selenide on anhydrous nickel chloride at a dull red heat; the compound Ni_3Se_4 is grey and seems to crystallise in the cubic system. *Nickel diselenide*, NiSe_2 , is a dark grey compound formed when hydrogen selenide acts on anhydrous nickel chloride at about 300° . *Nickel subselenide*, Ni_2Se , is a golden-yellow compound obtained by the prolonged action of hydrogen on any of the preceding compounds at a bright red heat. An *oxyselenide* is found when the selenate is carefully heated in dry oxygen.

The selenides are but little affected by boiling hydrochloric acid, but are slowly decomposed by hydrogen chloride at a high temperature. They are readily decomposed by chlorine, and are oxidised by nitric acid with production of selenites, and also by oxygen when heated in that gas.

C. H. B.

Periodic Phenomena in the Dissolution of Chromium in Acids. By WILHELM OSTWALD (*Zeit. physikal. Chem.*, 1900, 35, 33—76).—It has been shown by Hittorf that chromium is remarkable in its behaviour towards acids, assuming an active and a passive state in different circumstances (Abstr., 1898, ii, 363). The author, on investigating further the action of the active chromium on acids, observed a remarkable periodicity in the rate of evolution of the hydrogen, and constructed a self-registering apparatus in order to investigate this property. A piece of passive chromium rendered active by contact with cadmium under acid was dissolved in 2*N* hydrochloric acid; the curve obtained indicated an initial irregular action, which, after about 15 minutes, becomes periodic, the velocity rapidly increasing to a maximum and then falling more slowly to a minimum. The duration of each period was found to increase during the progress of the reaction. Various forms of curves are obtained from different pieces of chromium, and two pieces placed in the same acid were found to give a double summation curve, so the cause of the periodicity lies in the metal and not in the acid. The influence of acid concentration, of temperature, and of foreign substances was studied. Some compounds cause a lengthening of the period, formaldehyde has a remarkably great effect, whilst nitric acid and nitrogen oxides accelerate the periodicity, as also do chloric and bromic acids to a less marked

extent. A piece of almost pure chromium supplied to the author by Goldschmidt did not exhibit these periodic phenomena, neither could it be made active in this respect by treatment with any reagents.
L. M. J.

Constitution of Uranyl Salts. By HEINRICH LEY (*Ber.*, 1900, 33, 2658—2661).—The author has redetermined the conductivities of solutions of uranyl nitrate with specially purified materials, and the results confirm those previously obtained (this vol., ii, 67).

With uranyl nitrate $\mu_{1024} - \mu_{32}$ is 33.4 at 25°, whilst with barium nitrate the corresponding number is 23.1, so that the hydrolytic dissociation of the former in aqueous solution at the dilution 1 : 1024 does not exceed 5 per cent. Dittrich (*Abstr.*, 1899, ii, 629), found the hydrolytic dissociation of uranyl nitrate in 10 per cent. aqueous solution to be 3.6 per cent. at 65°, using the method of cane sugar inversion.

Uranyl salts of strong acids therefore, contrary to the view taken by Kohlschütter (this vol., ii, 484), who regarded the chloride as analogous to acyl chlorides, behave like the corresponding salts of aluminium and beryllium, and are for the most part normally ionised, the radicle UO_2 being the cation.
A. L.

Behaviour of some Halogen Compounds of the Carbon Group analogous to Stannic Chloride. By WL. VON KOWALEWSKY (*Zeit. anorg. Chem.*, 1900, 25, 189—195).—The method of investigation described in a previous paper (this vol., ii, 256), has been applied to titanium tetrachloride and tetrafluoride, and silicon tetrachloride. A solution of titanium tetrachloride in water forms a voluminous precipitate, which dissolves again at the ordinary temperature, without any corresponding change in conductivity. The value of the conductivity points to equilibrium being established before hydrolysis is complete; the hydrolysis is completed by boiling, or by heating in a sealed tube at 150°.

The results show that the tendency to hydrolysis of the tetrachlorides diminishes from tin to titanium and to silicon; the same remark applies to their ability to form complex salts.
J. C. P.

Alloys of Antimony and Tin. By W. REINDERS (*Zeit. anorg. Chem.*, 1900, 25, 113—125).—The freezing point curve for alloys of these two metals has been traced and interpreted; it consists of four branches, the three points of intersection occurring at 8, 20, and 51 per cent. of antimony, and at the temperatures 243°, 310°, and 430°. As found previously by Heycock and Neville (*Trans.*, 1890, 57, 387), the first branch of the curve, starting from pure tin, immediately rises, and there is no eutectic point below the melting point of tin.

These results have been supplemented by an investigation of the microscopic structure of the alloys, the polished sections being etched by electrolytic oxidation in dilute nitric acid. In alloys containing less than 8 per cent. of antimony, mixed crystals of tin and antimony are traced, of the same form as tin crystals. In alloys with 8—20 per cent., cubic crystals are first formed. The crystals characteristic of the third branch of the freezing point curve were somewhat undefined in

form; those of the fourth branch are of the antimony type. In some cases, the crystals first formed could be detected, even though theory required their disappearance under the existing conditions; this is probably due to those crystals getting coated in the rapid cooling, and so being protected from further interaction and transformation.

J. C. P.

Pentachloroplatinic Acid. By ARTURO MIOLATI and I. BELLUCCI (*Atti Real. Accad. Lincei*, 1900, [v], 9, ii, 51—57 and 97—102).—The compound $\text{PtCl}_4 \cdot \text{HCl}_2 \cdot 2\text{H}_2\text{O}$, obtained by Pigéon (Abstr., 1891, 1325) by heating chloroplatinic acid in presence of fused potassium hydroxide, is found to be the intermediate term between chloroplatinic acid and tetrachloroplatinic acid, $[\text{PtCl}_4(\text{OH})_2]\text{H}_2$; it separates as a reddish-brown, deliquescent mass which gives a pale yellow, acid, aqueous solution readily decomposing carbonates in the cold. With ammonia solution, it gives no precipitate, and on heating the liquid it becomes almost colourless. Ammonium and potassium chlorides precipitate the respective platinichlorides. Comparison of the values of the electrical conductivity of solutions of various strengths of the acid with the corresponding numbers for oxalic and hydrofluosilicic acids show it to be dibasic, as also does titration with sodium hydroxide solution. Conductivity experiments also show that one of the replaceable hydrogen atoms of the molecule has a strongly acid character, the other having only weak acid properties. The *sodium* salt, $\text{OH} \cdot \text{PtCl}_5\text{Na}_2$, exists only in solution whilst the *lithium* salt separates in the form of small, yellow needles which are very hygroscopic; the *barium* salt, with $4\text{H}_2\text{O}$, forms long, orange-yellow prisms, and the *silver* salt a yellowish precipitate stable in boiling water; the *thallium* salt and basic *lead* salt, $\text{PtCl}_5(\text{OH})\text{Pb}_2\text{Pb}(\text{OH})_2$, were also prepared.

T. H. P.

Platinum Tetrabromide. By ARTURO MIOLATI and I. BELLUCCI (*Atti Real. Accad. Lincei*, 1900, [v] 9, ii, 140—146).—On mixing solutions of a metallic salt and platinum tetrabromide, salts are precipitated corresponding with tetrabromoplatinic acid, $\text{PtBr}_4(\text{OH})_2\text{H}_2$. The *silver* and *thallium* salts form tobacco-coloured precipitates, the basic *lead* salt, $\text{PtBr}_4(\text{OH})_2\text{Pb}_2\text{Pb}(\text{OH})_2$, a dark brown powder and the *mercury* salt a brown precipitate. The electrical conductivity of solutions of platinum bromide by itself and also when mixed with varying quantities of alkali, shows that tetrabromoplatinic acid is a dibasic acid, and that only one of the replaceable hydrogen atoms is strongly dissociated in solution. The acid dissolves lithium carbonate with evolution of carbon dioxide.

T. H. P.

Behaviour of Rhodium in Alloys with the Noble Metals. By HEINRICH RÜSSLER (*Chem. Zeit.*, 1900, 24, 733—735. Compare Mietzschke, this vol., ii, 371).—When rhodium is cupelled with lead and silver, the button is left with a grey coating of metallic rhodium, which, after removal of the silver, appears as microscopic, six-sided plates and ladder- or star-shaped crystal aggregates. If merely added to molten silver, it floats on the surface of the button and is recovered

in the amorphous state. Rhodium, therefore, does not alloy with silver, and further its density must be less than 12.1.

Rhodium alloys with molten gold, and gives evidence of real combination, an alloy containing 1 per cent. being entirely soluble in aqua regia. A 10 per cent. admixture yields the free metal as feather- or rowel-shaped crystal aggregates, whilst if this limit is exceeded, amorphous rhodium is also found when the button is dissolved in nitro-hydrochloric acid.

Rhodium (2—5 per cent.) added to molten bismuth forms the compound RhBi_4 , which remains after treatment with nitric acid as glistening needles appearing under the microscope as crystalline aggregates. From richer alloys the metal is recovered in a crystalline or amorphous condition, according to the proportion used. If the metals are fused together in the proportions represented by the above formula (12 : 88), the resulting mass is entirely soluble in aqua regia or strong boiling nitric acid, but dilute nitric acid does not dissolve out the bismuth separately.

Iridium behaves like rhodium with silver under the conditions described, but this metal sinks in the button and its crystals are eight-sided. When cupelled with lead and gold, or merely fused with gold, it remains amorphous and shows no solubility in aqua regia.

Small quantities of platinum, in gold ingots (a few parts per thousand) are estimated by boiling out one of two similar cornets with concentrated sulphuric acid; the other with nitric acid. The excess in weight of the first over the second is reckoned as platinum. For larger quantities up to twenty parts per thousand, the second cornet is treated twice. For still larger quantities, the silver is first removed by sulphuric acid, the residue is dissolved in dilute aqua regia (avoiding excess of nitric acid), which leaves any rhodium and iridium behind, whilst the gold in the filtrate is precipitated with ferrous chloride. If ferrous sulphate is used, platinum may be precipitated with the gold.

R. L. J.

Mineralogical Chemistry.

Genesis of some Scottish Minerals. By JOHN GEORGE GOODCHILD (*Proc. R. Physical Soc. Edinb.*, 1900, 14, 181—220).—A speculative paper.

L. J. S.

Cinnabar-bearing Trachyte-tuff from South Tuscany. By JOHAN H. KLOOS (*Zeit. Kryst. Min.*, 1900, 33, 206; from *Zeit. prakt. Geol.*, 1898, 158—163).—A decomposed trachyte from Monte Amiata was found to contain 2.76—5.36 per cent. of mercury. Felspar-sand contained 0.35—54.35, and a kaolin 4.80 per cent. of mercury as cinnabar.

L. J. S.

Manganese Ore from the Amazon District. By FRIEDRICH KATZER (*Zeit. Kryst. Min.*, 1900, 33, 201; from *Oesterr. Zeit. Berg u. Hüttenwesen*, 1898, 46, 41—46).—A manganese ore, consisting princi-

pally of psilomelane, is distributed over an area of 1000 × 500 kilometres in the Amazon district. The purer material occurs in layers with a smooth surface and a reniform structure on one side (anal. I). Other material encloses rock-forming minerals and has a rough surface (anal. II.) with sometimes the appearance of a sandstone (anal. III.)

	MnO.	BaO.	Insol. in HCl.	SiO ₂ .	Al ₂ O ₃ , Fe ₂ O ₃ .	Total.	Sp. gr.
I.	65·73	15·58	6·25	—	—	87·56	3·83
II.	32·05	6·32	55·13	—	—	93·50	3·28
III.	29·14	4·70	—	53·16	5·77	92·77	3·21

L. J. S.

Tin Ores from Banca and Billiton. By RICHARD BECK (*Zeit. Kryst. Min.*, 1900, 33, 205—206; from *Zeit. prakt. Geol.*, 1898, 121—127).—Cassiterite occurs in the islands of Banca and Billiton, Malay Archipelago, as an original constituent in granite, in quartz-veins traversing granite, and in alluvial deposits. A small amount of tin occurs as silicate in the minerals of the granite. The cassiterite in the quartz-veins has probably been collected from the surrounding rock by thermal waters, as is suggested by the occurrence of tin oxide in a siliceous sinter deposited by a warm spring in Selangor. Analysis of this siliceous sinter gave,

SiO ₂ .	H ₂ O.	SnO ₂ .	Fe ₂ O ₃ .
91·8	7·5	0·5	0·2

L. J. S.

Marbles. By J. H. L. VOGT (*Zeit. Kryst. Min.*, 1900, 33, 203—204; from *Zeit. prakt. Geol.*, 1898, 4—16, 43—52).—A detailed discussion from various points of view of marbles (including dolomitic marbles). Several analyses are given.

L. J. S.

Phosphorite [from North Germany]. By W. KOERT (*Zeit. Kryst. Min.*, 1900, 33, 199; from *Jahrb. Preuss. geol. Landesanst.*, for 1898, 1900, 19, cxlvi—cxlix).—Boulders of a middle Miocene rock in the neighbourhood of Tesperhude, below Lauenburg on the Elbe, contain dark brown phosphorite nodules in association with molluscan shells. The nodules consist of sandstone with phosphorite as a cementing material, showing a concentric structure round each quartz-grain. Analysis by Klüss gave I for the rock and II for the nodules. The phosphorite has originated by concentration, around shells, from the surrounding rock.

	Fe.	CaO.	CO ₂ .	P ₂ O ₅ .
I.	2·75	21·17	17·39	0·46
II.	2·84	21·64	3·82	12·73

The remainder consists of silica (quartz and combined silica), water and organic matter, together with traces of aluminium, magnesium and potassium; fluorine is absent.

L. J. S.

Analyses of Minerals from the Langesund Fjord. By HJALMAR SJÖGREN (*Bull. Geol. Inst. Univ. Upsala*, 1900, 4, 227—230).—Analyses by R. Mauzelius are given of minerals from islets in the

Langesund Fjord, Norway, of which crystallographic descriptions have recently been given by G. Flink (*ibid.*, 1899, 4, 16—27). Epididymite (Abstr., 1895, ii, 23) occurs on Lille Arøe associated with eudidymite, ægirite, &c.; analysis I agrees with the formula $\text{HNaBeSi}_3\text{O}_8$. Associated with it is albite (anal. II) of secondary origin. Diaspore from Övre Arøe, occurring as violet-blue scales in the interspaces between crystals of natrolite and also as implanted tabular crystals, gave the results under III (the Al_2O_3 includes traces of Fe_2O_3 and TiO_2).

	SiO_2	Al_2O_3	BeO	Na_2O	K_2O	H_2O	Total.	Sp. gr.
I.	72.04	—	10.22	12.66	0.27	4.51	99.70	2.55
II.	65.99	19.96	—	11.34	1.45	1.04	99.78	2.587
III.	0.21	84.38	—	—	—	15.70	100.29	3.35

L. J. S.

Hardystonite and Zinc-schefferite from Franklin Furnace, New Jersey. By JOHN E. WOLFF (*Zeit. Kryst. Min.*, 1900, 33, 147—151).—A new find of hardystonite (Abstr., 1899, ii, 435) consists of a large mass of almost pure material; this is greyish-white, and gave the analytical results under I. The refractive indices are $\omega = 1.6691$, $\epsilon = 1.6568$ (Na).

	SiO_2	Al_2O_3	Fe_2O_3	ZnO	MnO	CaO	MgO	K_2O	Na_2O	Ign.	Total.
I.	37.78	0.91	0.43	23.38	1.26	34.22	0.26	0.78	1.10	0.34	100.46
II.	52.86	1.08		3.38	5.31	24.48	13.24	—	—	0.45	100.80

Analysis II proves a pyroxene occurring as large, brownish-red platy masses to be a zinc-schefferite. There is a good parting parallel to the basal plane; sp. gr. 3.31. Optical determinations are given in an appendix by G. Melczer.

L. J. S.

Epidote and Zoisite. By PIERRE TERMIER (*Bull. Soc. franç. Min.*, 1900, 23, 50—64. Compare Abstr., 1896, ii, 568; 1899, ii, 303).—A case is described of the occurrence together of the trimorphous minerals epidote, α -zoisite and β -zoisite. The "green rocks" of Mount Pelvas (or Paravas) on the Franco-Italian frontier contain veins and patches of white prehnite in which are embedded prisms of pale green epidote (anal. I by F. Pisani) and fine needles of very pale rose-coloured zoisite (anal. II and III). The zoisite has the optical characters of α -zoisite, but sometimes a little β -zoisite is intergrown with it. At times there are also regular intergrowths of epidote and zoisite, with a definite crystallographic orientation between the two minerals; this indicates that the crystalline structures of epidote and zoisite must be closely related.

	SiO_2	Al_2O_3	Fe_2O_3	MnO	CaO	MgO	K_2O	Na_2O	H_2O	Total.

L. J. S.

Chabazites from Sardinia, and from the Granulites of Striegau, Silesia. By CARLO RIMATORI (*Atti Real. Accad. Lincei*, 1900, [v], 9, ii, 146—151).—Analysis of chabazites from the granu-

lites of (I.) Maddalena and (II.) Striegau, and (III.) from the volcanic stone of Montresta give the following results :

	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	CaO	K ₂ O	Na ₂ O	H ₂ O
I. 48.66	18.32	2.18	5.47	1.56	4.64	19.17	
II. 48.54	16.44	2.93	7.55	3.46	0.11	21.05	
III. 47.96	22.51	—	6.27	2.96	trace	19.68	

T. H. P.

A New Mineral from near Cassel. By MAX BLANCKENHORN (*Zeit. Kryst. Min.*, 1900, 33, 199; from *Jahrb. Preuss. geol. Landesanst.*, for 1897; 1900, 18, iii, 109—129).—In a description of the Muschelkalk in the neighbourhood of Cassel, the following analysis by Klüss is given of an apparently new mineral, honey-yellow to orange-red and yellowish-green in colour, from a sandy, friable oolite :

SiO ₂	Al ₂ O ₃	CaO	MgO	H ₂ O	Organic matter.	Total.
20.71	31.17	1.99	0.07	45.59	0.42	99.95

L. J. S.

Altered Fayalite from the Granulites of Villacidro. By DOMENICO LOVISATO (*Atti Real. Accad. Lincei*, 1900, [v], 9, ii, 10—13).—In heterogeneous veins and nests in the Villacidro granulites are found small masses of a very dark mineral having a hardness between 5 and 6 and a density of 3.984 at 17.2°. Analysis (by C. Rimatori) :

SiO ₂	FeO	Fe ₂ O ₃	MnO	CaO, MgO, Na ₂ O	Total.
28.61	17.55	43.09	8.83	1.09	99.17

This corresponds with the formula, 4Si₂O₉Fe₂, 4Fe₂O₄, 3MnO. It is concluded that the mineral represents an altered form of fayalite, which, however, contains 63.54—65.49 per cent. of ferrous iron, and never more than 5.07 per cent. of manganese.

T. H. P.

Meteoric Irons from Griqualand East, South Africa. By EMIL W. COHEN (*Ann. S. African Museum*, 1900, 2, 9—19).—The "Kokstad" iron in the Vienna Museum gave, on analysis by J. Fahrenhorst, the results under I. A larger mass (298 kilograms) supposed to be from Matatiela in the same district, which has been in the South African Museum since 1885, gave analysis II. Both are octahedral irons with lamellæ of medium width, but they show differences in structure which suggest that they do not belong to the same fall. It is proposed that the latter shall be known as the Matatiela iron.

	Fe.	Ni.	Co.	Cu.	C.	Cl.	P.	S.	Total.	Sp. gr.
I.	91.21	8.01	0.63	0.02	0.03	0.05	0.22	trace	100.17	7.7876

L. J. S.

Meteoric Iron from Bethany, Great Namaqualand. By EMIL W. COHEN (*Ann. S. African Museum*, 1900, 2, 21—29).—As there is some confusion in the various irons from South-West Africa, it is proposed to refer to the one often called the great Namaqualand iron (weight about 232 kilograms) as the Bethany iron. The etched

surfaces of this show two portions, one with the normal structure of a finely lamellar octahedral iron, and the other as broad homogeneous-looking bands. Analysis by J. Fahrenhorst of these two portions gave the results under I and II respectively. Sp. gr. 7.8502.

I.	91.07	8.18	0.63	0.03	0.01	0.02	trace	0.04	0.06	100.04
II.	92.29	7.77	0.57	0.10					0.06	100.79

L. J. S.

New Meteorites from Allegan, Michigan, and Mart, Texas.
By GEORGE P. MERRILL and HENRY N. STOKES (*Proc. Washington Acad. Sci.*, 1900, 2, 41—68).—*Allegan*.—This stone fell at Allegan, Michigan, on July 10, 1899; the total weight was about 70 lbs. It is very friable; sp. gr. 3.905. Chondrules of olivine and of enstatite, sometimes broken and pitted, are set in a confused ground-mass of fragments of olivine and enstatite with metallic iron, troilite, and chromite. This agglomerated structure points to a tuffaceous origin of the meteorite. From analyses of the magnetic portion and of the stony portions soluble and insoluble in hydrochloric acid, the composition of the metal (23.06 per cent. of the whole) is given as; Fe, 91.42; Cu, 0.046; Ni, 7.87; Co, 0.66; Total, 99.996; and of the stony portion as:

SiO ₂	TiO ₂	P ₂ O ₅	Al ₂ O ₃	Cr ₂ O ₃	FeO.	FeS.	MnO.	CaO.
45.42	0.10	0.35	3.31	0.69	11.02	6.57	0.23	2.24
		MgO.	K ₂ O.	Na ₂ O.	H ₂ O.	NiO, Li ₂ O.		
		28.60	0.30	0.86	0.31	traces		

The isolated chromite gave; Cr₂O₃, 50.31; Al₂O₃, 9.67, FeO(Fe₂O₃), 28.78; MgO, 2.76; TiO₂, 1.20.

Mart, Texas.—This iron was found in 1898 and originally weighed 15½ lbs. The structure is octahedral with very distinct Widmanstätten figures. Small amounts of schreibersite, troilite and chromite are present. Analysis gave:

Fe.	Ni.	Co.	Cu.	P.	S.	Cr, Fe ₃ O ₄ .	Total.
89.68	9.20	0.33	0.037	0.158	0.017	traces	99.422

Physiological Chemistry.

The Influence of Minimal Doses of Suprarenal Extracts on Blood-pressure. By BENJAMIN MOORE and C. O. PURINTON (*Pflüger's Archiv*, 1900, 81, 483—490).—The authors doubt whether the substances separated from the suprarenals are those which cause elevation of blood-pressure. They are less active than the raw extract, and such minute doses of the active physiological substance produce

an effect on blood-pressure that a very small contamination of an inactive substance by the active one will lead to positive effects.

The extract was made from the suprarenals of oxen by extracting them with 10 times their weight of water. This extract was freed from proteid by boiling after acidifying, and then diluted 1000-fold. A more active extract was obtained by precipitating with lead acetate, and subsequently freeing from lead in the usual way. The active substance is in the filtrate, not in the precipitate, and although the filtrate loses by such treatment 75 per cent. of the organic material in the original extract, it is much more active. The filtrate contains the chromogen, and loses its activity slowly on standing. The amount of organic material was estimated in the usual way. As small a dose as 2-millionths of a gram per kilo. of body weight will in the dog produce a considerable rise of blood-pressure. Smaller doses, down to 0.2-millionths, produce a slight rise of pressure, usually followed by a fall. In some animals, the fall was not seen. The question arises whether the fall is caused by another substance, but the probability is that one active substance will produce different effects with different doses.

W. D. H.

Changes in the Substances in the Blood which are Soluble in Ether. By RICHARD WEIGERT (*Pflüger's Archiv*, 1900, 82, 86—100).—The substances present in the blood corpuscles which are soluble in ether diminish in amount by remaining in the warm, although air is excluded. This diminution of the ether extract is accompanied by a rise in the amount of acids soluble in ether. The substance in the blood which is soluble in ether, but diminishes in this way, is not fat, as stated by Cohnstein and Michaelis, and the change should not be described as lipolytic. In the blood-corpuscles and in the blood-plasma, there appears also to be a chemical process which leads to an increase of the ether extract.

W. D. H.

Hydroxylions of the Blood. By RUDOLF HÖBER (*Pflüger's Archiv*, 1900, 81, 522—540).—The alkalinity of the blood is determined by the amount of hydroxyl ions in it. These arise by the hydrolytic splitting of the alkali salts of the weaker acids, especially of carbonic acid. An estimation of the total quantity of these salts gives, therefore, no indication of the alkalinity of the blood. The alkalinity can only be estimated by methods which do not alter the chemical balance there present. It is measurable by electro-chemical methods, and can be calculated from the E.M.F. of a concentration chain for hydrogen ions, or for a chain of hydroxyl ions. The two methods give widely different results. This, however, does not depend on the variability of the dissociation constants of water, but on the fact that the hydroxyl ion chains behave in an irregular manner to the oxygen electrodes used. With hydrogen electrodes, the molecular concentration of hydroxyl ions in defibrinated ox-blood is about $0.1-10^{-5}$.

W. D. H.

Oxidation in Animal Tissues. By AN. K. MEDVEDEFF (*Pflüger's Archiv*, 1900, 81, 540—573).—The experiments recorded are limited to observations on the oxidising action of liver extracts on salicyl-

aldehyde. A previous auto-digestion of the extract for periods varying from 18 hours to 6 days makes no difference to its oxidising power. Oxidation is therefore the result of the interaction of the aldehyde and the active material (oxidation-ferment) in the extract. This action is proportional to the square root of the concentration of the aldehyde, and directly proportional to the concentration of the ferment. It is proportional to the square root of the concentration of the aldehyde, because this is the proportion of that substance which is dissociated in solution. This idea is worked out in great detail and at considerable length, and theoretical views put forward to explain the action of oxidising ferments in particular, and all ferments in general.

W. D. H.

Composition of the Fat of Human Chyle. By FRANZ ERBEN (*Zeit. physiol. Chem.*, 1900, 30, 436—452).—The fat in the urine in a case of chyluria was investigated. This is regarded as equivalent to chyle fat. The following figures give the chief results. Elementary analysis: C, 76.52—76.59; H, 11.88—12.11; O, 11.37—11.55 per cent.; specific gravity, 0.905—0.92 at 15°; melting point, 44°; solidification point, 26°; acid number, 3.508; saponification number, 199.579; ether number, 196.071; Reichert-Meissl number, 2.254; Hehner number, 94.92; iodine number, 54.42; melting point of insoluble fatty acid, 44°.

The fat contains:—Free fatty acids, 1.680; neutral fats, 95.987; lecithin, 0.500; cholesterol, 1.715; glycerol, 10.717; total fatty acids, 95.573; soluble fatty acids, 0.65; insoluble fatty acids, 94.92 per cent. The insoluble fatty acids consist of oleic acid, 58.4; hydroxystearic acid, 6.6; stearic acid, 25.0; palmitic acid, 9.0; myristic acid, 1.0.

W. D. H.

The Properties of Nerve under the Influence of Certain Poisons. By NICOLAI E. WEDENSKI (*Erfüger's Archiv*, 1900, 82, 134—191).—The main properties of nerve investigated were excitability, conductivity, and action-current. The last was detected either by the telephone or galvanometer. Tracings were also taken of the attached muscle. A certain stretch of the nerve was subjected to the local action of certain poisons in solution (cocaine, chloral hydrate, phenol, and chloralose). There is stated to be complete parallelism between the alterations produced of the functional properties of nerve and those in its action-current. Some exceptions to this rule noted in the case of chloralose are only apparent and are due to the extraordinarily rapid return of function which occurs when the action of the poison is suspended.

W. D. H.

Action of Certain Ions on Ventricular Muscle. By D. J. LINGLE (*Amer. J. Physiol.*, 1900, 4, 265—282).—The experiments were performed with strips of the turtle's ventricle, and the results of Loeb's experiments on rhythmic contraction of striped muscle, and gonionemus tissue apply very closely to cardiac muscle. Sodium and not calcium is the stimulus for its rhythmic action, but a pure sodium chloride solution is injurious at last; calcium and possibly potassium salts improve the rhythm by neutralising this injurious

action. Heart-strips will not beat rhythmically in solutions of non-conductors like sugar and glycerol.

W. D. H.

Origin of Glycogen From Proteid. By BERNHARD SCHÖNDORFF [with HEINRICH OFFERGELD] (*Pflüger's Archiv*, 1900, 82, 60—85).—The question whether glycogen can originate after feeding on a diet free from carbohydrates has been frequently investigated, but a critical examination of these researches from those of Claude Bernard's onwards shows that not a single one is conclusive. Either glycogen might have remained over in spite of the previous starvation period, or the diet employed (meat, &c.) was not free from carbohydrate. In the present experiments, frogs were used, and casein was the diet given to them; the result is stated to show with absolute certainty that no glycogen originates from a proteid which does not contain a carbohydrate group.

W. D. H.

Can the Whole of the Glycogen Present in an Organ be removed by Sufficiently Long Extraction with Boiling Water? By JOSEPH NERKING (*Pflüger's Archiv*, 1900, 81, 636—640).—Calf's liver was repeatedly extracted with boiling water until the wash waters were absolutely free from glycogen. The residue was then extracted with dilute potash, when more glycogen was obtained. In the two experiments recorded, the amount of glycogen which was not extractable by water was respectively 24.9 and 76.4 per cent. of the total quantity present. This confirms the view that the glycogen which can be extracted by water is free in the organ, whilst that which cannot, is in chemical combination.

W. D. H.

Origin and Excretion of Oxalic Acid. By ERNST SALKOWSKI (*Chem. Centr.*, 1900, ii, 131—132; from *Berlin. klin. Woch.*, 37, 434—437).—The source of oxalic acid is not proteid, for increase of proteid food (casein) does not produce a rise in oxalic acid excretion, and the acid is not formed from proteid during tryptic or bacterial activity. Calcium oxalate is constantly found in the fæces, and in not unimportant quantities in the bile. The source of oxalic acid is uric acid, and so, indirectly, nuclein; the acid is formed by a process of oxidation. Whether the seat of action is the liver was the subject of some experiments which did not yield satisfactory results. The subject of alimentary oxaluria is also discussed.

W. D. H.

Solubility of Uric Acid in Nucleic and Thymic Acids. By MOTONOSUKE GOTO (*Zeit. physiol. Chem.*, 1900, 30, 473—477).—A fuller account of experiments previously published (this vol., ii, 421).

W. D. H.

Absorption of Free Oxygen by Normal Urine. By MARCELLIN P. E. BERTHELOT (*Compt. rend.*, 1900, 131, 547—552).—Normal urine slowly absorbs oxygen from the air in quantity varying from 8 c.c. to 20 c.c. per litre of urine. There is no alteration in the quantity of urea present, in the proportion of dissolved carbon dioxide, or in the acidity, and the absorption of oxygen seems to be due to, or connected with, the colouring matters or leuco-

colouring matters of the urine. The fact that urine is a reducing agent although formed from arterial blood shows that the function of the kidneys is not purely mechanical. C. H. B.

Acidity of Urine. By MARCELLIN P. E. BERTHELOT (*Compt. rend.*, 1900, 131, 552—553).—The ratio of the acidity of urine as determined with phenolphthalein as indicator to that determined with litmus solution or litmus paper by the spot method, varies considerably. In one case it was 85 : 45, in another 52 : 16, and in another 126 : 14. These ratios are not affected by the absorption of oxygen by the urine. C. H. B.

Estimation of the Acidity of Urine. By OTTO NÄGELI (*Zeit. physiol. Chem.*, 1900, 30, 313—349).—An elaborate investigation by the use of numerous indicators of the various factors which make up the total acidity of the urine. W. D. H.

Excretion of Antipyrine by the Animal Body. By D. LAWROFF (*Ber.*, 1900, 33, 2344—2346).—Antipyrine was administered in doses of 4—10 grams per diem to a full-grown dog weighing 35 kilos. The urine contained a *glycuronic acid*, $C_{17}H_{20}O_8N_2$, of which the crystalline compound of the *barium* salt with barium chloride was analysed. M. O. F.

Hæmolytic Serums. By JULES BORDET (*Ann. Inst. Pasteur*, 1900, 14, 257—296).—The action of hæmolytic serums varies considerably with the kind of animal employed, but in the same serum the alexin which causes destruction of bacteria is identical with the hæmolytic substance. The stromata of the corpuscles manifest towards such alexins a fixative power which is compared with what is seen in the case of staining reagents. It is possible to prepare an antitoxin antagonistic to hæmolytic serum; this is anti-hæmolytic and anti-bactericidal. The action between the two substances appears to be that of chemical neutralisation. W. D. H.

Anti-hæmatic Serums. By PIERRE NOLF (*Ann. Inst. Pasteur*, 1900, 14, 297—331).—A number of experiments on the subject of agglutination are presented, and the mechanism of the process discussed. Mixture of the serum of one animal with that of another often produces a precipitate, but the precipitating agent is not regarded as the agglutinating substance. W. D. H.

Cytotoxins. By ÉLIE METCHNIKOFF (*Ann. Inst. Pasteur*, 1900, 369—377).—**Hæmolytic Serum and Red Corpuscles.** By J. CANTACUZÈNE (*ibid.*, 378—389).—**Leucotoxin.** By BESREDKA (*ibid.*, 390—401).—**Action of Hæmatotoxin on Man.** By ÉLIE METCHNIKOFF and BESREDKA (*ibid.*, 402—414).—The term cytotoxin is introduced for those poisons of animal origin which act on the formed elements (cells, &c.) of organs. The best known example is that contained in serum. The practice of transfusion of an animal's blood into man has been abandoned because of the destruction of the red corpuscles so produced. The main experimental fact brought forward in this series of papers (which relate to the poisons which act, more or less specifically, on the red and white blood corpuscles respectively), is that small doses, instead of producing destruction of the corpuscles in question, act

in a stimulating way so as to lead to an increase in their number. This does not appear to be due to the development of an antitoxin.

W. D. H.

The Gonococcus and its Toxin. By J. DE CHRISTMAS (*Ann. Inst. Pasteur*, 1900, 14, 331—349).—The gonococcus in suitable media elaborates a toxin which, when applied in small doses to the cerebral tissues, produces rapid death. This gonotoxin is not dialysable, it is destroyed at 73°, and is precipitable by ammonium sulphate. If injected subcutaneously, an antitoxin is formed in the blood. The two substances neutralise one another both *in vivo* and *in vitro*. W. D. H.

Relationship between Chemical Constitution and Physiological Action. I. Physiological Action of Alkines of Piperidine. By CESARE PADIERI (*Chem. Centr.*, 1900, ii, 588—589; from *Ann. Farm. Chim.*, 1900, 181—194).—The physiological action of piperylalkine and pipercolylalkine on frogs, rabbits, and dogs is similar to that of piperidine, whilst on the other hand, methylpipercolylalkine exercises a healing influence. Thus the introduction of glycol into the piperidine molecule has no effect on the physiological action, no matter whether the glycol replaces a hydrogen atom of the imino-group or a hydrogen attached to the closed chain. When, however, a hydrogen atom of the piperidine ring is replaced by glycol, and at the same time a hydrogen atom of the imino-group replaced by the methyl group, the physiological action is completely changed. E. W. W.

Chemistry of Vegetable Physiology and Agriculture.

Researches on the Formation of Acetic Acid by Bacteria producing Lactic Acid. By CH. BARTHEL (*Centr. Bakt. Par.*, 1900, [ii], 6, 417—420).—The quantity of acetic acid produced during the lactic acid fermentation of milk varies only slightly with the conditions, the minimum being formed under those which are most favourable for the culture of the bacteria producing lactic acid. Acetic acid may be considered as a pathogenic product of these bacteria.

R. H. P.

Micro-organisms forming Dextran. By F. W. J. BOEKHOUT (*Centr. Bakt. Par.*, 1900, [ii], 6, 161—165).—A new species of *Streptococcus*, named by the author *S. hornensis*, has been isolated from curdled milk, some water samples, and flowers, and has the power of converting media containing up to 20 per cent. of sucrose into a slimy mass with the formation of dextran. Peptone is the most favourable source of nitrogen for the culture of these bacteria, which are capable of producing dextran even in the absence of oxygen.

R. H. P.

Schizomycetic Fermentation. By OSKAR EMMERLING (*Ber.*, 1900, 33, 2477—2479. Compare Abstr., 1899, ii, 569).—A 10 per

cent. solution of milk sugar, when treated with *Bacillus lactis aerogenes* in the presence of calcium carbonate and nutritive salts, becomes turbid and evolves hydrogen and methane; at the same time, a slimy precipitate is produced consisting of a mass of viscid threads. In the presence of atmospheric oxygen the fermentation proceeds until a clear, viscid liquid is formed; at this stage, the filtered solution, on the addition of alcohol, deposits a *galactan*, $C_6H_{10}O_5$; this substance, a white, tasteless powder, reduces Fehling's solution only after hydrolysis with dilute acids, and yields mucic acid on oxidation with nitric acid. Succinic acid is also a product of this fermentation.

Viscid substances are produced in the fermentation of galactose by this bacillus, but their formation is not noticed in the case of dextrose, the latter sugar yielding acetic and inactive lactic acids. Mannitol, under similar conditions, yields large quantities of alcohol and succinic acid, together with traces of the volatile acids. G. T. M.

Chemical and Biological Researches on the Preparation of "Sake." By YOSHINAO KOZAI (*Centr. Bakt. Par.*, 1900, [ii], 6, 385—405).—The preparation of "sake" can be divided into four stages, (i) preparation of the "koji" (the "malt"), (ii) preparation of the "moto" (the yeast), (iii) the fermentation, (iv) the clarification and pasteurisation. The enzyme of the "koji" (*Aspergillus oryzae*) forms dextrose from starch, dextrin, melitriose, sucrose, and maltose, but does not attack inulin or lactose; 2 per cent. of alcohol acts injuriously on the enzyme, which is completely inactive in solutions containing 28 per cent. of alcohol; as, however, during the whole process of the preparation of "sake" there is never more than 18 per cent. of alcohol present, this enzyme must be still active in the later stages of the process. In many samples of "koji" a white mould very similar to Lindner's *Sachisia suaveolens* and *Oidium lactis* is found; it ferments sucrose, raffinose, dextrose, lævulose, or maltose, but not trehalose, rhamnose, lactose, or melizitose. The yeast of sake ferments sucrose, maltose, *d*-mannose, lævulose, dextrose, or methylglucoside very easily, trehalose or *d*-galactose with some difficulty, does not ferment lactose or rhamnose, and splits up melitriose into melibiose and lævulose. R. H. P.

Is the Formation of Enzymes a Trustworthy Characteristic of Yeasts? By ALBERT KLÖCKER (*Centr. Bakt. Par.*, 1900, [ii], 6, 241—245).—The experiments of Dubourg (*Abstr.*, 1899, ii, 376) have been repeated and confirmed. The author disagrees with Dubourg's interpretation of these, and considers that the formation of enzymes is the most trustworthy characteristic of yeasts. R. H. P.

"Chinese Yeast" and the so-called Amylomycetes (*Mucor Rouxii*). By CARL WEHMER (*Centr. Bakt. Par.*, 1900, [ii], 6, 353—365).—"Chinese yeast," a preparation used in East Asia for starting the fermentation of rice, contains a mould, *Mucor Rouxii*, which can be cultivated in solutions of lævulose, dextrose, galactose, sucrose, lactose, maltose, or inulin with peptone or ammonium nitrate, alcohol being formed in every case. R. H. P.

Nitrification in the Soil of Forests. By W. MIGULA (*Centr. Bakt. Par.*, 1900, [ii], 6, 365—370).—Nitrites and nitrates are not found except in minute quantities in the soil of forests. The author describes experiments in which such soil was inoculated with organisms which produce nitrites and nitrates. Nitrification did not take place in the upper layers, which contained decomposing leaves, but only in the deeper layers, zones of increasing intensity of nitrification being formed, which were different from the similar zones formed in arable land. The formation of nitrites, however, proceeded much more quickly in the cultures than the formation of nitrates.

R. H. P.

Occurrence and Action of Proteolytic Ferments in Germinated Seeds. By WL. BUTKEWITSCH (*Chem. Centr.*, 1900, ii, 386—387; from *Ber. deut. bot. Ges.*, 18, 185—189. Compare Green, *Abstr.*, 1887, 987, and Neumeister, *ibid.*, 1894, ii, 290).—The results of the author's experiments confirm those of Green (*loc. cit.*) in showing the presence in germinated seeds of a proteolytic enzyme which, like "animal trypsin," decomposes proteids with production of amides. An enzyme of this kind seems to be present in the axillary organs of seedlings of *Lupinus luteus*, and also (perhaps as zymogen) in ungerminated seeds of *L. angustifolius*.

Among the products of decomposition, substances were present which yield ammonia when boiled with dilute hydrochloric acid as in Sachsse's method for estimating asparagine or glutamine.

N. H. J. M.

Proteolytic Ferments of Germinating Seeds. By V. HARLAY (*Compt. rend.*, 1900, 131, 623—626. Compare this vol., i, 511, 576; ii, 35, 233, 301).—Germinating lentil seedlings are extracted with water and chloroform and the filtered extract tested with the tyrosinase derived from *Russula delica*. The freshly-prepared solution remains colourless, but after a fortnight's digestion either alone or with casein, it gives a marked coloration, the liquid becoming red and then brown. If the solution is boiled before the addition of casein, the colour reaction is considerably diminished. It is found that the boiled solution has a solvent action both on the casein and the coagulated albumin.

These results point to the existence of tyrosine in the plant at the commencement of the experiment, a further quantity of this substance being formed during digestion at the expense of either the vegetable proteid matters or the casein. Hence the proteolytic ferment of the germinating lentil is analogous to the trypsin of animal tissues, since it gives rise to similar products during the digestion of proteids.

G. T. M.

Germination and Growth of Peas in Solutions of Salts of Fatty Acids. By OSKAR LÖVINSON (*Chem. Centr.*, 1900, ii, 344, and 388—389; from *Bot. Centr.*, 83, 1—12, and 33—43).—Instead of the usual nutritive solutions, the author employed solutions containing all the necessary bases in the form of formates, acetates, and propionates respectively. Nitrogen was present in the form of the

corresponding ammonium salt, sulphur as carbon disulphide, and phosphorus in the free state dissolved in water (1 : 50,000).

The results of the germination experiments showed that the salts of fatty acid retarded germination; the percentage numbers of seeds which germinated were 77.5 in formates, 66.66 in acetates, and 10 in propionates. Carbon disulphide promoted germination, but somewhat influenced the subsequent development. Phosphorus only retarded germination slightly.

The solutions of formates and acetates (but not propionates) proved to be very favourable to the growth of fungi and bacteria.

N. H. J. M.

Germination and Growth of Peas in Solutions of Salts of Fatty Acids. By OSKAR LÖVINSON (*Chem. Centr.*, 1900, ii, 681—682; from *Bot. Centr.*, 83, 209—224).—The plants grown in solutions of [salts of] formic acid lived on an average 52 days, whilst those in solutions of acetic or propionic acid lived 28 and 17 days respectively. The injurious effects of the compounds seemed to be diminished by gradually accustoming the plants to stronger solutions. The plants after becoming inured to solutions of [salts of] formic acid would doubtless be able to assimilate mineral and organic nutriment provided that the strength of the solutions had been such as to prevent the emptying of the cotyledons; this also applies to the other acids with certain limitations. The great length of life (80 days) and vigorous growth of plants grown in solutions of formates, prove that the plants are capable of obtaining their sulphur from carbon disulphide and of assimilating phosphorus directly, and that the alkalis and alkaline earths do not require to be present in the form of salts of mineral acids.

E. W. W.

Proteid Metabolism in Plants. By ERNST SCHULZE (*Zeit. physiol. Chem.*, 1900, 30, 241—312).—A large number of observations on the chemical composition of different parts of various plants at different ages are recorded. They are carried out on the lines of the author's previous work, and confirm the views he had advanced concerning proteid metabolism. The proportion between the amounts of proteid decomposition products (amino-acids, hexon bases, &c.), varies at different stages. The most marked change is a diminution in the quantity of leucine, tyrosine, and the simpler amino-compounds, and the simultaneous increase of asparagine, and in some cases glutamine also, as age advances. The theory that the proteids break up into asparagine and a carbohydrate is not confirmed. Asparagine appears to be easily utilised for proteid synthesis.

W. D. H.

Material for Plant Nutrition in Apples and Pears. By EDUARD HOTTER (*Chem. Centr.*, 1900, ii, 484—485; from *Zeit. landw. Vers. Wes. Ost.*, 1900, 583—585).—By suitably manuring fruit trees their lives are prolonged, and weak trees strengthened. Analyses of 20 kinds of apples and pears showed that for every 100 kilograms of fruit about 70 grams of nitrogen, 35 of phosphoric oxide, 170 of potassium oxide, and 14 of lime are withdrawn from the ground. Fresh apples yield about 0.336 per cent. of ash, and contain 0.076 of

nitrogen, whilst pears give 0.301 of ash and 0.069 of nitrogen; calculated on the dry substances, these data become, for apples, 2.24 and 0.47 per cent. respectively, and for pears, 2.01 and 0.46. The following analyses of the ash of apples and pears are quoted, the figures in brackets referring to the pears: SiO_2 , 1.08 (1.55); SO_3 , 2.49 (5.02); P_2O_5 , 10.42 (11.92); Fe_2O_3 , 1.18 (0.98); CaO , 4.22 (4.73); MgO , 3.71 (4.29); K_2O , 51.58 (52.88). E. W. W.

Myrosin. By THOMAS BOKORNY (*Chem. Zeit.*, 1900, 24, 771—772).—The presence of myrosin in plant substances may be conveniently proved by observing whether the addition of potassium myronate to about 1 gram of the material triturated with 5 c.c. of water at 30—40°, and contained in a small stoppered flask, develops the odour of mustard-oil within the course of 48 hours. Myrosin was thus detected in the seeds (except where otherwise stated) of the following plants. An asterisk denotes that potassium myronate or a glucoside which yields mustard-oil is already present.

Cruciferae:—*Black mustard, white mustard, summer radish (*Raphanus sativus*), roots also, **Iberis amara*, **I. umbellata*, **I. sempervirens*, *scurvy grass (*Cochlearia* off.), *winter cabbage (*Brassica oleracea*), red, white, curly, and turnip cabbages, wallflower (*Cheiranthus cheiri*), summer-stock, and *watercress (*Nasturtium* off.).

Leguminosae:—Bean (*Phaseolus vulgaris*), lentil, pea, and vetch.

Umbelliferae:—Carrot (*Daucus carota*), tap-root, and parsley, root.

The following gave negative results, the part tested being mentioned:

Compositae:—Herbage of *Aposeris foetida*, seeds of *Artemisia dracunculus* (possibly present), and leaf of elecampane (*Inula helenium*).

Various:—Herbage of pæony and spurge (*Euphorbia cyparissias*), young fruit of lime, fruit and seed of maple, herbage and blooms of soapwort (*Saponaria* off.), *Borago salvia* off., and *Campanula rotundifolia*, seeds of pine and sea-pine, the inflorescence, leaf and stem of houseleek (*Sempervivum tectorum*), vegetative part of stone-crop (*Sedum acre*), and a young rhubarb leaf, also the onion, leek, and ripe beans.

R. L. J.

Bitter Principles of Hops. By GEORG BARTH (*Chem. Centr.*, 1900, ii, 681; from *Zeit. ges. Brauw.*, 23, 509—513).—A sample of commercial lupulin gave 18.27 per cent. of ash, 63.93 of material soluble in ether, and 36.07 of lupulin husks. The portion soluble in ether contained 0.18 per cent. of wax, 11.55 of α -resin, 43.31 of β -resin, 0.17 of ash, and 8.72 of fat, oil, γ -resin, &c. The portion insoluble in ether contained 15.31 of ash insoluble in hydrochloric acid, 2.75 of ash soluble in hydrochloric acid, 4.78 of proteid substances, 2.34 of pentosans, and 10.89 (by difference) of non-nitrogenous substances, tannins, fibres, &c. The substances extracted by ether or light petroleum did not contain nitrogen. The quantity of sand in commercial lupulin varies from 10.9 to 20.2 per cent. E. W. W.

Adlumia Cirrhosa—A New Protopine-bearing Plant. By JULIUS O. SCHLOTTERBECK (*Amer. Chem. J.*, 1900, 24, 249—253; and *Ber.*, 1900, 33, 2799—2801).—The root of *Adlumia cirrhosa* (climbing

fumitory) contains about 1 per cent. of protopine, whilst the leaves contain much less. Fumarine is probably identical with protopine, and since fumarine was discovered and named long before its discovery in opium by Hesse, the author is of opinion that the name protopine should be abandoned.

E. G.

An Alcornoco Bark known commercially as Jaborandi, and Alcornoco Barks in general. By C. HARTWICH and E. DÜNNEN-BERGER (*Arch. Pharm.*, 1900, 238, 341—352).—A “jaborandi bark” imported from Venezuela in 1888, was found, by botanical examination, to belong in reality to a species of alcornoco; it contained 16.6 per cent. of tannin. Further, several varieties of alcornoco barks were examined botanically, and, to a certain extent, chemically. In particular, from a specimen of bark denominated *Cort. Alcornoco*, the alcornin of Biltz, Frenzel and Spigatis was isolated. This melts at 205°, and has a specific rotation +33.83°; a number of its colour reactions are described. It has the formula $C_{22}H_{34}O$, and it yields a *monoacetyl* derivative; consequently, it is an alcohol of the nature of phytosterol, and is better named *alcornol*.

C. F. B.

Astragalus Caryocarpus. By GEORGE B. FRANKFORTER (*Chem. Centr.*, 1900, ii, 484; from *Amer. J. Pharm.*, 72, 320—325).—The unripe fruit of *Astragalus caryocarpus* has a bitter taste, which is probably due to the presence of an alkaloid, whilst the ripe fruit, on the other hand, has a peculiar, sweet taste. From the latter, a disaccharose, *astragalose*, has been obtained in the form of a grey hygroscopic powder. It melts at 95—98°, reduces Fehling's solution, has a rotatory power $[\alpha]_D +38.5^\circ$, and yields a phenylhydrazone melting at 186—188°. Analysis of the latter showed it to be a hydrazone of a hexose. The rotatory power and properties of the sugar are, however, easily affected by change of conditions.

A substance which contains nitrogen and gives the reactions of an alkaloid was also isolated from the plant extract.

E. W. W.

The Sea-weed *Ulva Latissima* and its Relation to the Pollution of Sea-water by Sewage. By EDMUND A. LETTS and JOHN HAWTHORN (*Chem. News*, 1900, 82, 164—165).—*Ulva latissima*, or sea lettuce, contains C, 35.15; H, 5.27; N, 6.25; O, 37.96; ash, 15.37 (in which is S, 3.21; Fe, 2.20) per cent., and when fermented yields hydrogen, carbon dioxide, propionic, butyric, and, probably, acetic acids; later, the mass blackens from the ferrous sulphide formed, and hydrogen sulphide is disengaged. The weed abounds in polluted waters, and can thrive in and assimilate large quantities of nitrogen from sea-water charged with sewage and ammonia or nitrates; probably this is the cause of the high percentage of nitrogen in the plant. It is suggested that the presence of the weed in large quantities may perhaps be regarded as evidence of sewage contamination.

D. A. L.

Toxic Action of Acid Sodium Salts on *Lupinus Albus*. By LOUIS KAHLLENBERG and ROLLAN M. AUSTIN (*J. Physical Chem.*, 1900, 4, 553—569).—The toxic powers of solutions of acid sodium salts and of acids are compared by means of determinations of the concentra-

tions of solutions in which seedlings of *Lupinus albus* will just live. The acid sodium salts exert a far greater toxic influence than would be expected from the concentration of the hydrogen ions, and the authors hence conclude that the dissociation theory is unsatisfactory in explaining the toxic action of these acid salts. L. M. J.

Digestibility of some Non-nitrogenous Constituents of certain Feeding Stuffa. By G. S. FRAPS (*J. Amer. Chem. Soc.*, 1900, 22, 543—552).—According to Ladd (*N. York Agric. Expt. Stat. Geneva Rep.*, 1889, 149), the sucrose and reducing sugars present in lucerne and mixed hay, wheat bran, maize, cotton seed, and linseed meals and oats are completely digested; in turnips fed with mixed hay the reducing sugars were completely digested, but of the sucrose only 78.7 per cent. was digested.

The results of the experiments now described showed that as a rule the sugars are completely digested. The examination of twenty-three samples of excrement obtained in digestive experiments showed that neither sucrose nor dextrose was present; some of the samples contained reducing substances, but these do not seem to be sugars.

The results of Stone's experiments on the digestibility of pentosans (*Agric. Science*, 7, 6) in various foods (grasses, hay, sugar-beet, wheat bran, &c.) indicated that the average digestibility is 60.3 per cent. (compare also Lindsay and Holland, *ibid.*, 8, 172).

The author has determined the total pentosans, and also the pseudo-pentosans (that is, the constituents of the crude fibre which yield furfuraldehyde) in several foods, and also their digestibility. From 0 to 21 per cent. of the pentosans consists of pseudo-pentosans, and in four out of five cases the pseudo-pentosans are less digestible than the pentosans of the non-nitrogenous extract.

Of the nitrogen-free extract, 53 to 15 per cent. consists of sugars and pentosans. In the case of cow-pea meal, maize bran, and rice bran, the remainder of the extract consists of starch, which is more digestible than the pentosans; in the case of timothy hay and crab-grass hay, the order of digestibility is sugars, pentosans, residue.

As regards the crude fibre, the pseudo-pentosans are less digestible than the residue. It seems probable that the crude fibre and undigested non-nitrogenous extract decompose in the intestines with production of gases, of soluble substances which are resolved, and of insoluble products which pass into the excrement and, being soluble in acid and alkali, appear in the analysis as non-nitrogenous extract. This would make the digestibility of the non-nitrogenous extract seem less, and that of the crude fibre greater than is actually the case.

Attention is called to the importance of determining sugar in foods, and especially in hay and cotton seed meal. The determination of starch and pentosans is also of more importance than that of the crude fibre. N. H. J. M.

Rye as Food. By WOLDEMAR VON KNIERIEM (*Chem. Centr.*, 1900, ii, 394—396; from *Landw. Jahrb.*, 29, 484—523).—Crushed rye in conjunction with clover hay only slightly increases the yield of milk, but the rye seemed to have no injurious effect on the cows. When cows receive sufficient fat (in oil cake), rye increases the yield

of milk rather more than oats; the amount of fat in the milk was diminished by rye.

In experiments with sheep, it was found that with the exception of the non-nitrogenous extract, the constituents of rye are less digestible than those of oats; the fat in rye is very slightly digested. Pigs consume rye very unwillingly after some time, and exclusive feeding with rye causes illness, from which, however, the pigs rapidly recover when fed with barley. Rabbits and poultry object to rye. Rabbits digest much of the non-nitrogenous extract, but not the proteids.

On the whole, rye may be advantageously employed for feeding if used with care, and in conjunction with sufficient digestible fat.

N. H. J. M.

Vetch Corn as Food. By WOLDEMAR VON KNIERIEM (*Chem. Centr.*, 1900, ii, 396; from *Landw. Jahrb.*, 29, 524—540).—Crushed vetches considerably increased the yield of milk, but diminished the amount of fat in the milk. No injurious effect was observed during six years.

Rabbits digested vetches well, and the constituents showed higher digestion-coefficients than those of the various cereals.

Pigs object to vetches alone, and soon cease to gain in weight. This is attributed mainly to the high amount of proteids.

As regards the taste of milk and butter, the results obtained with vetches were satisfactory; no bitter taste was noticed. N. H. J. M.

Feeding Cows with Cane Sugar. By EBERHARD RAMM (*Bied. Centr.*, 1900, 601—602; from *Milch Zeit.*, 1899, 673).—As in the other feeding experiments (following abstracts), the cows received during each period: hay, 14; straw, 4·5; roots, 50; and brewers' grains 4 kilos. per 1000 kilos. of live weight. In addition, they received earth-nut cake and cane sugar respectively (6 kilos.). The rations contained the following amounts of digestible substances per 1000 kilos. live weight; earth-nut cake ration: proteid, 4·12; fat, 0·93; and non-nitrogenous matters, 13·48. Sugar ration: proteid, 1·70; fat, 0·54; and non-nitrogenous matters, 15·65.

The sugar had no injurious effect on the health of the cows. As compared with earth-nut cake, it increased the live weight by about 1 per cent., diminished the yield of milk per day by 0·86 kilo., and the yield of milk fat and milk dry matter by 0·058 and 0·133 kilo. respectively.

N. H. J. M.

Feeding Cows with Maize Gluten. By EBERHARD RAMM (*Bied. Centr.*, 1900, 29, 600—601; from *Milch Zeit.*, 1899, 658).—The results of feeding experiments showed that, like maize bran (this vol., ii, 39), maize gluten, as compared with earth-nut cake increased the yield of milk. The percentage composition of the maize gluten was found to be as follows: nitrogenous matter, 35·90; fat, 1·85; non-nitrogenous extract, 31·80; crude fibre, 16·00; ash, 1·20; and water, 13·25.

N. H. J. M.

Feeding Cows with Malt-germ Molasses. By EBERHARD RAMM (*Bied. Centr.*, 1900, 29, 599—600; from *Milch Zeit.*, 1899, 641).—Under the conditions of the experiments, malt-germ molasses

was shown to be a suitable substitute for the same weight of earth-nut meal. The malt-germ molasses contained : nitrogenous matter, 14.60 ; fat, 3.85 ; non-nitrogenous extract, 47.15 (including sugar, 25.05 ; crude fibre, 4.40 ; ash, 6.35 ; and water, 23.05 per cent. (compare this vol., ii, 502).

N. H. J. M.

Non-saccharine Matter contained in Molasses. By EBERHARD RAMM and C. MOMSEN (*Chem. Centr.*, 1900, ii, 489 ; from *Milch Zeit.*, 1900, 433—436).—The effect of the non-saccharine portion of molasses when used as food was investigated by feeding five milch cows with the following series of foods. (1) Residual molasses containing about 41 per cent. of sugar ; (2) the corresponding amount of raw sugar ; (3) an equal quantity of raw sugar with the non-saccharine mud obtained in the process of removing sugar from molasses ; (4) residual molasses as in (1). In addition to these, a good basal ration was used throughout the experiments. The molasses-mud was used as a substitute for the ash, nitrogenous and other non-saccharine components of the molasses. By making the fourth period like the first and using the same rations, the effects due to decreasing lactation were eliminated from the calculations. During the raw sugar period the milk was found to contain less fatty matter, whilst in the third period it increased by as much as 71 grams of butter fat per day per 1000 kilograms of body weight, and the milk had at this time the highest specific gravity. The quantity of milk remained about constant in the first three periods and then decreased.

E. W. W.

Beans. By TÁMAS KOSUTÁNY, RICHARD WINDISCH, E. VON HÉRICHS-TÓTH, LADISLAUS VON SZÉLL and ADOLF FALTIN (*Landw. Versuchs-Stat.*, 1900, 54, 463—479).—Analyses are given of Hungarian and French beans (compare Ballard, this vol., ii, 174) ; the results indicate that the Hungarian beans are the more nutritive, containing more proteids and carbohydrates, and less cellulose than the French beans.

Bean oil, extracted by ether resembles olive oil in appearance. The oil, dried over sulphuric acid, has the following properties : Sp. gr., 0.9670 ; Hehner number, 78.5 ; Reichert-Meissl number, 2.46 ; Köttsedorfer number, 135.4 ; iodine number (Hübl), 119.9 ; refraction at 25° and 40°, 81.5 and 72.5 respectively. The oil contains fatty acid triglycerides, much lecithin and a good deal of sulphur.

N. H. J. M.

Cork Oak. By EMILIO TASSELLI (*Bied. Centr.*, 1900, 29, 615—617 ; from *Staz. sper. agrar. ital.*, 1899, 32, 209).—The results of analyses are given showing the amounts of ash, and of ash constituents, in the cork, wood, roots, leaves, and fruit of the cork-oak. As regards the fact that large amounts of nitrogen and mineral matter are taken from the soil and that no manure is required, the results of calculations are given showing that, notwithstanding the large amounts of cork and wood removed, only one-tenth of the total supply of the soil would be utilised in 1200 years.

N. H. J. M.

Hemp. By M. SAMOGGIA (*Bied. Centr.*, 1900, 29, 602—604 ; from *Staz. sper. agrar. ital.*, 1898, 31, 353).—Pot experiments are described

in which hemp was grown in ignited sand watered with (a) Nobbe's solution containing chlorine, and (b) Knop's solution containing no chlorine, but more nitrate than (a). In the first stages of growth, when the chlorine of the seeds sufficed, the plants watered with Knop's solution grew best, but subsequently they became unhealthy. The total weight of air-dried plants were (a) 28.5 and (b) 42.0 grams. The separated fibre contained (a) 90.149 and (b) 88.470 per cent. of dry matter of the following percentage composition :

	Organic matter.	Cellulose.	Crude fat.	Reducing sugar.	N.	Ash.
a.	91.43	53.36	2.02	3.90	1.658	8.57
b.	88.85	37.00	2.83	7.98	2.465	11.15

The ash contained (per cent.):

	K ₂ O.	CaO.	P ₂ O ₅ .	SiO ₂ .	Cl.
a.	36.27	15.62	9.67	5.95	1.38
b.	30.85	5.33	10.79	6.33	0.59

Müntz and Girard showed that application of chlorides increased the cellulose and diminished the ash and reducing sugar.

Maceration during six days did not cause loss of pentoses and pentosans.
N. H. J. M.

Cultivation of Parsnip. By HENRI GUÉPIN (*Ann. agron.*, 1900, 26, 476—477; from *J. Agr. prat.*, 1900, i, 527).—The yield of parsnip varies from 30,000 to 60,000 kilos. per hectare. The percentage composition is as follows: Dry matter, 15.3; nitrogenous matter, 1.4; fat, 0.2; non-nitrogenous extract, 11.6; and cellulose, 1.2. As regards feeding value, the results indicate that parsnip is superior to mangolds, turnips, and carrots.

As indicated by the composition of the ash, parsnip requires abundance of phosphoric acid, potash, and lime.

Parsnip is suitable for feeding horses, cows, and bullocks.

N. H. J. M.

Effect of Different Potassium Salts on the Composition and Yield of Potatoes. By THEODOR PREIFFER (*Landw. Versuchs-Stat.*, 1900, 54, 379—385. Compare Abstr., 1898, ii, 306).—A reply to Sjollema (this vol., ii, 305), in which the author shows that Sjollema's results are not opposed to, but confirm, his own, which indicated that the injurious action of "crude salts" was due to the presence of magnesia. Other results obtained by Sjollema lend support to the author's view that the different degrees of injury by potassium chloride on the yield of starch do not accord with the amount of chlorides found in the potatoes, but depend rather on the variety of the potato.

N. H. J. M.

Soil Investigations in the Tokay Wine District. By BÉLA VON BIRÓ (*Landw. Versuchs-Stat.*, 1900, 54, 337—348).—Determinations of carbon dioxide, from which the calcium carbonate is calculated, were made in a large number of Hungarian soils. The results, as well as descriptions of the physical properties of the soils, are given in tables.

N. H. J. M.

Practical Conclusions from [the Results of] Soil Analyses. By P. DOERSTLING (*Bied. Centr.*, 1900, 29, 586—588; from *Fühling's Landw. Zeit.*, 1899, 184).—The soils were extracted (1) for 24 hours with water at the ordinary temperature, (2) for 6 hours with water at 50—55°, (3) for 6 hours with water through which carbon dioxide was passed, and (4) for 24 hours with 5 per cent. citric acid. The samples were collected in the spring after autumn application of (A) dung and (B) green manure. The following percentage amounts of the total potash, calcium carbonate, and phosphoric acid were dissolved by the different solvents.

	A. Farm-yard manure.			B. Green manure.		
	K ₂ O.	CaCO ₃ .	P ₂ O ₅ .	K ₂ O.	CaCO ₃ .	P ₂ O ₅ .
Total per cent.	0.1645	0.611	0.1198	0.2185	0.418	0.1552
Per cent. of total.	{ 1. 15.0 2. 22.9 3. 23.9 4. 64.4	{ 3.8 8.4 20.9 76.6	{ 21.7 34.1 31.4 46.4	{ 13.5 15.5 18.7 65.0	{ 6.9 13.1 24.4 72.7	{ 15.0 12.8 21.3 38.2

Analyses are given of soil before and after the application of lime and green manure, both together and separately. The results accord in some cases, but not always, with the yields of crops.

Analyses of soils growing healthy and diseased roots showed that the disease was not due to deficiency of nutritive matters in the soil.

N. H. J. M.

Composition of some Manure-soils. By LEOPOLD KOURIMSKY (*Bied. Centr.*, 1900, 29, 595—597; from *Zeits. landw. Versuchswes. Oesterr.*, 1899, 2, 580).—In the north-west of Bohemia various deposits, derived, it is supposed, from ancient Celtic dwellings and cemeteries, are employed as manures. The following percentage results were obtained from three deposits in Postelberg:

	Stones.	Soil.	Water.	Loss on ignition.	N.	K ₂ O.	CaCO ₃ .	P ₂ O ₅ .
1.	7.1	92.9	4.00	7.44	0.168	0.687	5.52	1.408
2.	3.9	96.1	9.80	7.22	0.196	0.908	3.64	1.344
3.	—	—	8.35	6.23	0.134	0.54	15.50	1.20

The results of analyses of muds from ponds and rivers are also given.

N. H. J. M.

Manurial Experiments. By JOSEF HANAMANN (*Bied. Centr.*, 1900, 29, 591—594; from *Zeit. landw. Versuchswes. Oesterr.*, 1899, 2, 573).—From the results of 35 years' experiments in pots and beds, the conclusion is drawn that it is possible to obtain quite normal plants in pots, and that such experiments furnish results of practical importance.

The results of some vegetation experiments, which are given in detail, indicated that when loss of nitrate by drainage is impossible, the nitrogen left after the first year will increase the yield of barley considerably.

The analytical results show that the composition of the barley grown in pots was normal, whilst as regards the size of the grain and the

relation of grain to straw, no essential difference was observed in the pot plants as compared with those grown in the field.

N. H. J. M.

Manurial Experiments with Vegetables. By RICHARD OTTO (*Bied. Centr.*, 1900, 29, 588—591; from *Gartenflora*, 1899, 48, 563).—Lettuce. The best results as regards yield and quality were obtained with farmyard manure. Sodium nitrate and kainite, both separately and mixed, do not seem favourable to the production of solid heads.

The order of yield in the case of kohl-rabi, after the various manures, was (1) farmyard manure, (2) compost, (3) sodium nitrate and superphosphate, (4) sodium nitrate and kainite, (5) sodium nitrate, superphosphate and kainite, and (6) sodium nitrate. Non-nitrogenous manures alone did not greatly increase the yield as compared with the unmanured plot. Analyses of the plants obtained under the influence of the various manures are given. The percentage of nitrogen in the dry matter varies from 3 (without manure and with superphosphate alone) to 5.42 (with farmyard manure). The ash contained K_2O , 27.61 to 44.33; CaO , 8.84 to 12.32; and P_2O_5 , 12.80 to 16.26 per cent.

N. H. J. M.

Distribution of Manures. By BERTHAULT (*Ann. Agron.*, 1900, 26, 417—430).—In 1884, a field which had been manured with 30,000 kilos. of farmyard manure per hectare received in addition 200 kilos. of sodium nitrate. On one portion of the land the nitrate was sown broadcast and on two other portions it was distributed along the furrows, and in holes 40 cm. apart along the lines. The yield of roots on the three portions of the field was as follows: Nitrate sown broadcast, 21,785; in the furrows, 38,392; and in holes, 40,337. Whilst the localisation of manures must depend on the nature of the manures themselves and on the crop, it is thought that the system may be generally adopted with advantage (compare Schloesing, *Abstr.*, 1893, ii, 141).

N. H. J. M.

Methods of Experiments on the Preservation of Farm-yard Manure. By THEODOR PFEIFFER, F. MOSZEIK, and OTTO LEMMERMANN (*Landw. Versuchs-Stat.*, 1900, 54, 349—378).—The conflicting results hitherto obtained in experiments on the preservation of stable manure are, at any rate in part, attributed to imperfect methods. The method now proposed is based on the fact that the nitrogen supplied in the food is completely recovered in the excrement after deducting the amount deposited in the body and that of the milk wool, &c. The composition of the food and of the materials used for litter is therefore determined, as well as the composition of the fæces, urine and milk. By determining ash constituents (phosphoric acid and potash), the amounts of which remain of course unaltered, it is possible to ascertain how far the nitrogen results can be depended on. An important point which has to be considered is the extent of the loss of nitrogen in the manure before it is removed from the stalls (compare Müntz and Girard, *Compt. rend.*, 1892, 115, 1318, and 116, 108).

As regards the foods to be employed, mangolds and lucerne are to be

avoided. The authors propose meadow hay, dried beetroot sections and crushed earth-nut cake, with straw for litter. The whole quantities of hay and straw required for the experiment are prepared beforehand and sampled.

After describing the stalls and the arrangements for the solid and liquid manure, the sampling of the manure, and the analytical methods employed, the authors give in tables a number of results which show that the taking of samples can be made sufficiently accurate and that the feeding of the animals and the collection of the products can be conducted without loss.

N. H. J. M.

Street-dust as Manure. By ADOLFO CASALI (*Bied. Centr.*, 1900, 29, 583—586; from *Staz. sper. ital. agrar.*, 1898, 31, 377).—Street-dust is recommended as manure by Strabo, Pliny, and Columella, and it was highly valued during the middle ages. The results of analyses of a sample of sifted street-dust collected during a dry September show that the material is suitable for soils poor in lime. It is also of use for the purpose of mixing with nitrogenous manures, both as a diluent and to enable them to be uniformly distributed; in the case of superphosphate, street-dust would be of use in diminishing the acidity.

The author considers that street-dust is also of use in supplying a great variety of microbes, derived partly from rain and partly from excrementitious matters.

N. H. J. M.

Analytical Chemistry.

***p*-Nitrophenol as an Indicator.** By LEOPOLD SPIEGEL (*Ber.*, 1900, 33, 2640—2641. Compare Langbeck, *Chem. News*, 1881, 43, 161, and Wieland Abstr., 1883, 1167).—The author recommends a 2—5 per cent. alcoholic solution of *p*-nitrophenol in place of methyl-orange in ordinary acidimetry and alkalimetry. The change from yellow when alkaline to colourless when acid is very marked, and the indicator is quite indifferent towards carbon dioxide. Sodium ammonium phosphate and crystallised borax may be estimated by the aid of the same indicator, but not fused borax.

J. J. S.

Wide Occurrence of Indicators in Nature. By G. S. FRAPS (*Amer. Chem. J.*, 1900, 24, 271—276).—The author has examined extracts of a large number of coloured flowers, leaves and fruits, and has found that, as a rule, the colouring matters are fairly sensitive as an indicator, giving one colour when acid and another when alkaline.

E. G.

Abegg and Herz's Method for the Separation and Recognition of Acids. By WILHELM FRESSENIUS (*Zeit. anal. Chem.*, 1900, 39, 566—574).—With regard to Abegg and Herz's systematic scheme

(this vol., ii, 436), the author objects that the same necessity does not exist with acids, as with bases, to separate them one from another before they can be identified, and that many of the reactions used by Abegg and Herz are untrustworthy. For instance, neither cyanogen nor arsenious acid is precipitated by calcium chloride under the conditions defined. Tartaric acid is only precipitated completely by calcium chloride when time is allowed for it to crystallise. The precipitate is then very sparingly soluble in acetic acid, and may be easily mistaken for calcium oxalate. Calcium phosphate exhibits a similar behaviour with acetic acid. Boric acid finds no place in the scheme, and the difficulties resulting from the presence of silicates are not provided for. Other objections can be advanced to the methods advocated for the detection of the halogens and nitric acid, and on the whole the scheme has but little practical value. M. J. S.

Estimation of Potassium Perchlorate in Alkali Nitrates (Nitre and Chili Saltpetre). By N. BLATTNER and J. BRASSEUR (*Chem. Zeit.*, 1900, 24, 767).—Five grams of the dried sample are mixed with 7 to 8 grams of pure calcium hydroxide and heated in a covered platinum or porcelain crucible for 15 minutes over a Bunsen burner. When cold, the mass is transferred to a measuring flask marked at 128 c.c. and extracted for an hour with water. After making up to the mark (3 c.c. is taken as the volume of the undissolved matter), the liquid is well shaken and filtered through a dry filter. One hundred c.c. (4 grams of sample) of the filtrate are carefully neutralised with dilute nitric acid using methyl-orange as indicator, and the chlorine is then titrated with silver nitrate as usual. After allowing for the percentage of chlorine present as chloride, the balance is calculated into potassium perchlorate. L. DE K.

Process for the Estimation of Chlorides, Chlorates, and Perchlorates in the Presence of each other By N. BLATTNER and J. BRASSEUR (*Chem. Zeit.*, 1900, 24, 793).—The chlorine as chloride is first estimated as usual. It is then again estimated after reduction of any chlorate by boiling with sulphurous acid and finally after ignition with calcium hydroxide (see preceding abstract).

The authors have not as yet found any chlorate in samples of saltpetre. L. DE K.

Estimation of Potassium Iodide. By THOMAS S. BARRIE (*Pharm. J.*, 1900, [iv], 11, 58).—When potassium iodide (5 grams in 20 c.c. of water) containing chlorides and bromides is treated with 5 per cent. solution of potassium dichromate (10 c.c.) and 10 per cent. sulphuric acid (10 c.c.), iodine alone is liberated. This is extracted with toluene or carbon disulphide, the solution shaken with a known volume of $N/10$ sodium thiosulphate solution and the excess titrated with standard iodine. R. L. J.

Simple and Accurate Method for Estimating the Dissolved Oxygen in Fresh-water, Sea-water, Sewage Effluents, &c. By EDMUND A. LETTS and ROBERT F. BLAKE (*Chem. News*, 1900, 82, 163—164).—An ordinary separating funnel is filled with the water to be examined and a measured volume withdrawn; a definite volume of

standard ferrous sulphate solution, containing about 48 grams per litre, is added, and then ammonia, the combined volume of these two reagents being equal to the volume of the water removed. The stopper is inserted with the exclusion of air-bubbles, and the liquids are mixed together. After 15 minutes, the funnel is inverted, the stem filled with a mixture of equal volumes of sulphuric acid and water, the tap opened, and when all the iron hydroxide is dissolved the solution is titrated with permanganate or dichromate.

D. A. L.

Estimation of Oxygen in Copper by Ignition in Hydrogen. By LEONARD ARCHBUTT (*Analyst*, 1900, 25, 253—262).—Blount (Abstr., 1896, ii, 333) has described a process based on the reduction of copper oxide by hydrogen. The sample is melted in a current of dry hydrogen and the water collected and weighed. The author whilst acknowledging the accuracy of this process prefers to estimate the oxygen by the loss in weight which the sample suffers when ignited in hydrogen as has already been proposed by Hampe. Thirty to forty grams of the copper, best in the form of bright turnings small enough to pass through a tube $\frac{1}{8}$ -inch in diameter, are thoroughly cleansed with ether, dried, and introduced into a dry weighed bulb tube, which is then reweighed. The whole is ignited for about an hour in a current of purified hydrogen, and then allowed to cool in the current. When cold, the hydrogen left in the bulb tube is displaced by dry air and the tube reweighed.

An illustration of the apparatus and bulb tube is given.

L. DE K.

Detection of Free Phosphorus. By P. MUKERJI (*J. Asiat. Soc. Bengal*, 1900, 69, ii, 97—101).—The author has noticed that hydrogen generated in contact with free phosphorus becomes phosphorescent.

The incompletely oxidised compounds of phosphorus yield, like phosphorus itself, a gas which burns with a green flame, but this is not luminous in the dark. The glow is lessened to some extent by the presence of much alcohol, ether greatly interferes with it, but is soon expelled, oil of turpentine stops it and should be first got rid of by washing the material with alcohol and then with water. Nitrous fumes, hydrogen sulphide, iodine, and oil of mustard in moderate quantities do not interfere.

The apparatus in its simplest form consists of a flask fitted with a tap funnel and a jet. Common zinc and dilute sulphuric acid are introduced, and after making sure that the reagents cause no glow, the suspected article is added and the effect observed in a dark room.

L. DE K.

Estimation of Phosphorus in Coke and Coal. By J. M. CAMP (*Chem. News*, 1900, 82, 8—9).—The coke, powdered to pass through a 40-mesh sieve, is dried at 100° for an hour, and when cool 5 grams are exposed in a porcelain crucible in a muffle overnight; the contents are, next morning, transferred to a platinum crucible, supported on a platinum tripod, on the top of the chimney of an Argand burner, and heated below boiling with 5 c.c. of dilute hydrochloric acid (1:2), and 10 c.c. of dilute hydrofluoric acid until dry,

further dried, but not baked, allowed to cool, and warmed with 15 c.c. of the dilute hydrochloric acid. The contents are transferred to an evaporating dish, boiled for one or two minutes with 5 c.c. of strong nitric acid, filtered, treated with 25 c.c. of strong ammonia, then with sufficient strong nitric acid to exactly dissolve the precipitate, after which 5 c.c. more is added. Precipitation with molybdate follows, &c., and 1.63 per cent. of the dried precipitate is taken as phosphorus.

D. A. L.

Estimation of Phosphorus in Ores, Pig-iron, and Steel containing Arsenic. By J. M. CAMP (*Chem. News*, 1900, 82, 9).—Five grams of pulverised dry ore are gently boiled for 30 minutes with hydrochloric acid, the solution diluted, filtered, and exposed on a steam-bath overnight. In the morning, 2 grams of pure oxalic acid and 50 c.c. of hydrochloric acid are added, the solution covered with a watch glass, taken to dryness sharply, but not baked, then, when cool, evaporated with 30 c.c. of strong hydrochloric acid until the first appearance of insoluble ferric chloride, treated with 10 c.c. of strong nitric acid, and when violent action has ceased, warmed to complete solution, diluted, and filtered into a flask, washing with 2 per cent. nitric acid. The portion of the ore insoluble in hydrochloric acid is ignited, fused with mixed carbonates, dissolved in excess of hydrochloric acid, allowed to dry overnight in a steam-bath, moistened with dilute hydrochloric acid and enough hot water to dissolve chlorides, warmed, filtered, added to the contents of the other flask, and the phosphorus determined in the whole, in the manner described in the preceding abstract. The method is applicable to the analysis of pig-iron and steel.

D. A. L.

Estimation of Phosphorus in Steel, &c. By FRED IBBOTSON and HARRY BREARLEY (*Chem. News*, 1900, 82, 55).—A solution of 2 grams of the steel in 45 c.c. of nitric acid of sp. gr. 1.2 is treated with permanganate until a pink colour or a precipitate of manganese dioxide persists on boiling; it is cleared with ferrous sulphate and after the addition of 4 c.c. of strong ammonia is shaken while hot with 30 c.c. of molybdate reagent, then kept at 70–80° for a few minutes, passed through a pulp filter, and washed. The precipitate is dissolved in ammonia, treated with 10 to 12 c.c. of hydrochloric acid and 10 c.c. of a solution of lead acetate (40 grams to the litre), heated and well shaken with a mixture of 10–12 grams of ammonium chloride and 50 c.c. of strong ammonium acetate solutions; the precipitate is filtered and weighed as lead molybdate. The process is applicable (with slight modifications) to pig-irons, nickel-steels and alloys, chromo-steels, tungsten-steels, spiegels and ferro-manganese (compare *Abstr.*, 1899, ii, 337).

D. A. L.

Estimation of Phosphoric Acid as Phosphomolybdic Oxide. By H. C. SHERMAN and HENRY ST. JOHN HYDE (*J. Amer. Chem. Soc.*, 1900, 22, 652–658).—The solution representing 0.2–0.5 gram of the sample of phosphate is mixed with 25 c.c. of strong ammonia of sp. gr. 0.9; after neutralising with nitric acid, 5 to 8 c.c. of acid of sp. gr. 1.42 are added in excess. The solution is diluted to 150 c.c., heated to 50° and a 3 per cent. solution of ammonium molyb-

date slowly added with constant stirring until there are about 20 c.c. in excess. After 10 minutes, the liquid is decanted through a porcelain Gooch crucible, and the precipitate is washed thrice by decantation with 50—70 c.c. and then on the filter with 200—250 c.c. of cold 1 per cent. nitric acid. Finally, the precipitate is ignited by placing the crucible inside a nickel crucible and heating the bottom of the latter to a dull red heat for 15 minutes as directed by Woy (Abstr., 1898, ii, 138) and weighed as the oxide, $P_2O_5 \cdot 24MoO_3$. L. DE K.

Adulteration and Analysis of Arsenical Insecticides. By JOHN K. HAYWOOD (*J. Amer. Chem. Soc.*, 1900, 22, 568—582; 705—706).—The author calls attention to the adulterations of arsenical insecticides. These are readily detected by the usual methods.

As regards the *bona fide* articles they may be assayed as follows. Water may be determined in Paris or Scheele's green by drying for 12 or 15 hours at 100°. The total arsenious oxide is best estimated by the iodine process recommended by Smith (this vol., ii, 47). A good method for estimating copper in these substances is to titrate the iodine set free from potassium iodide in an acetic acid solution.

In order to completely extract free arsenious oxide from Paris green, a very large amount of water is necessary. The author finds that 500 c.c. of water dissolve an appreciable quantity of the arsenical copper compound, and that, therefore, the amount of free arsenious oxide found will be in excess of the truth (compare next abstract).

The amount of arsenious oxide, combined with the dissolved copper oxide, may be readily calculated from the amount of the latter. One part of copper oxide corresponds with 1.875 parts of arsenious acid.

A large number of analyses are communicated.

L. DE K.

[Estimation of] **Free Arsenious Oxide in Paris Green.** By EUGEN W. HILGARD (*J. Amer. Chem. Soc.*, 1900, 22, 690—693).—The author states that, on account of the slight solubility of octahedral arsenious oxide, the quantity of water used to dissolve the free arsenious oxide from 1 gram of Paris green should be raised to 600 or, preferably, 1000 c.c., and the extraction continued for 24 hours (compare preceding abstract.) The use of the microscope is recommended for the rapid detection of decided quantities of free oxide.

L. DE K.

Qualitative Test for Boric Acid. By E. M. WADE and M. L. WADE (*J. Amer. Chem. Soc.*, 1900, 22, 618).—About 0.1 gram of the substance to be tested for boric acid is put into a test-tube 2.5 cm. in diameter, and 20 cm. long; 0.5 c.c. of hydrochloric acid, and 10 c.c. of methyl alcohol are added, and the mixture is rapidly boiled down to a small bulk by moving the lower end of the tube in the flame of a burner, and holding the moistened end of a piece of turmeric paper just outside the mouth in contact with the evolved vapour. If boric acid is present, the turmeric will turn a characteristic red, which is coloured pink, or deep purple, or blue when moistened with very weak ammonia.

L. DE K.

Estimation of Potassium by Phosphomolybdic Acid. By WAVELET (*Chem. Centr.*, 1900, ii, 689—690; from *Ann. Chim. anal. appl.*, 5, 289).—The precipitate which sodium phosphomolybdate gives

with potassium salts contains potassium and phosphoric acid in the invariable ratio $K_2O/P_2O_5 = 1.99$, although the amount of molybdenum may vary. To prepare the reagent, 140 grams of sodium carbonate, 20 grams of ordinary sodium phosphate, and 70 grams of freshly ignited molybdenum trioxide are dissolved together in 500 c.c. of water, 200 c.c. of nitric acid are added, the solution made up to a litre and filtered after 24 hours. To estimate potassium, an excess of the reagent is added, the mixture evaporated to dryness, the residue rubbed to powder, heated with dilute nitric acid (1:10), and, after cooling, the precipitate collected and thoroughly washed with dilute nitric acid. The phosphoric acid in it is then estimated in the usual way with magnesia mixture, but the ammonium magnesium phosphate may be titrated instead of being ignited. It is dissolved in nitric acid, and the solution neutralised with ammonia; 1 c.c. of acetic acid and some sodium acetate are added, and then a standard solution of lead nitrate (35 grams per litre) until a drop gives a yellow colour with potassium iodide.

M. J. S.

Shortened Method for Estimating Potassium in its Salts. By HUGO NEUBAUER (*Zeit. anal. Chem.*, 1900, 39, 481—502).—The following process, if strictly adhered to in every detail, gives an accurate estimation of potassium in a solution which may contain sodium, magnesium, calcium, chlorides, and sulphates: Twenty-five c.c. of the aqueous solution of the substance (0.5 gram) are mixed with a few drops of hydrochloric acid and a small excess of platinic chloride, and evaporated on the water-bath just to dryness. After cooling, the mass is moistened with 1 c.c. of water and well rubbed with a pestle made from glass rod; 30 c.c. of alcohol are then added in portions of 10 c.c. at a time, rubbing very intimately after each addition. After half an hour, the precipitate is transferred to an asbestos filter in a platinum Gooch crucible, and thoroughly washed with strong alcohol (93—96 vols. per cent.) and finally with ether. The contents of the crucible are next reduced by very gradual heating in hydrogen, or equally well in coal-gas (5 minutes below red heat and 20 minutes at a very dull red), and then thoroughly washed with hot water. The crucible is then filled with 5 per cent. nitric acid, which is allowed to act for half an hour, returning it as it slowly percolates through the filter. The reduced platinum is again thoroughly washed with hot water, dried, ignited, and weighed. Multiplication by 0.48108 gives the corresponding weight of potassium oxide. Should barium be present, the reduction must not be performed with coal-gas, but with hydrogen; with this exception, the process needs no alteration, and equally good results are obtained.

M. J. S.

Detection of Sodium Carbonate in Milk. By P. Süss (*Chem. Centr.*, 1900, ii, 596; from *Pharm. Centr.*, 41, 465).—As little as 0.05 gram of sodium carbonate in 100 c.c. of milk can be detected by the rose-red coloration produced on adding a 0.2 per cent. alcoholic solution of alizarin.

M. J. S.

Estimation of Free Alkali in Soaps. By R. E. DIVINE (*J. Amer. Chem. Soc.*, 1900, 22, 693—695).—The author has modified

Dudley and Pease's process, titration of the free alkali by means of $N/10$ alcoholic stearic acid, so as to avoid the troublesome filtration of the alcoholic solution of soap from any undissolved alkali carbonate.

Two grams of undried soap are introduced into a round-bottomed flask, 50 c.c. of alcohol and a definite number of c.c. of $N/10$ alcoholic stearic acid, more than sufficient to neutralise any alkali present, are added, and also a little phenolphthalein. After boiling for half an hour under a reflux condenser, the excess of stearic acid is titrated with $N/10$ alcoholic soda and the total amount of alkali calculated.

Another 2 grams of the sample are boiled with 50 c.c. of alcohol, a 10 per cent. solution of barium chloride is added in quantity just sufficient to decompose the alkali found, and the liberated barium hydroxide is then titrated with $N/10$ alcoholic stearic acid and phenolphthalein, the result being expressed as free alkali.

The difference between the two titrations represents alkali carbonate.

L. DE K.

New Volumetric Method for the Estimation of Silver. By LAUNCELOT W. ANDREWS (*Amer. Chem. J.*, 1900, 24, 256—266).—The process is a modification of the one introduced by Pisani for the estimation of very small quantities of silver by means of a solution of iodine containing starch.

The silver solution should contain not quite 5 per cent. of nitric acid and be free from mercury and the lower oxides of arsenic and antimony; any nitrous acid should be expelled by boiling, and sulphurous acid must be removed by addition of ferric sulphate. A solution of ferrous sulphate is added in such quantity that there shall be at least as much iron as silver, and an equal quantity of iron as ferric sulphate is also added; if the amount of silver should be more than 0.02 gram per 100 c.c., it is best to first convert the iron sulphates into nitrates by judicious addition of strontium or lead nitrate.

The starch-iodine solution is then run in from a burette until the colour of the liquid turns slightly blue, showing that all the silver is precipitated. This solution is best prepared by heating 9 grams of pure iodine and 50 grams of purified maize-starch with 100 c.c. of water in sealed tubes for an hour in a boiling water-bath. When cold, it is diluted to a convenient strength, say a $N/20$ or $N/100$ solution. This should be standardised with silver nitrate; estimation of the iodine by means of sodium thiosulphate would give erroneous results.

L. DE K.

Gravimetric Estimation of Zinc as Sulphate. By WILHELM EULER (*Zeit. anorg. Chem.*, 1900, 25, 146—154).—The estimation of zinc as sulphate is sufficiently accurate for ordinary work. The zinc solution, which must contain only sulphuric acid or acids which are volatile in the presence of sulphuric acid, is evaporated to dryness in a weighed platinum crucible and the residue cautiously heated at a dull red heat to constant weight. The result may be confirmed by decomposing the sulphate over the blow-pipe and weighing as zinc oxide.

E. C. R.

Lead and Cadmium Ferrocyanides. By EDMUND H. MILLER and HENRY FISHER (*J. Amer. Chem. Soc.*, 1900, 22, 537—543).—The authors confirm Gay Lussac's statement that lead ferrocyanide always retains more or less potassium ferrocyanide from which it cannot be freed by washing. A number of experiments have shown that the amount of potassium increases with the acidity of the liquid, it being just the same whether there is an excess of lead or ferrocyanide. The results also agree closely with Low's statement (*Abstr.*, 1893, ii, 437) that a solution containing 10 grams of crystallised potassium ferrocyanide per litre equals 0.01 gram of lead per c.c.; Furman has stated that 16 grams should be taken, but this figure is no doubt based on the erroneous conclusion that the formula of lead ferrocyanide may be calculated from that of zinc ferrocyanide.

Cadmium ferrocyanide thrown down from an ammoniacal solution has a composition agreeing with Hermann's formula $\text{CdK}_2\text{Fe}(\text{CN})_6$, but when precipitated from an acid solution, its composition lies between that formula and the one proposed by Wyruboff, $\text{K}_5\text{Cd}_5[\text{Fe}(\text{CN})_6]_4$. This fact is also confirmed by Mackay (this vol., ii, 49), who states that it requires about 2.5 per cent. less potassium ferrocyanide to precipitate cadmium than would be required by the formula $\text{CdK}_2\text{Fe}(\text{CN})_6$. The results again contradict Furman's statement that the cadmium standard may be calculated from the zinc standard.

L. DE K.

Analysis of Lead and Tin Ores, also of the most important Lead and Tin Preparations, and their Commercial Products. By H. MENNIOKE (*Chem. Centr.*, 1900, ii, 399; from *Zeit. öffentl. Chem.*, 6, 227—235. Compare this vol., ii, 688).—Galena may be assayed by reducing 0.5 to 1 gram of the sample with 30 c.c. of dilute hydrochloric acid (1:3) and 1 gram of granulated zinc in a platinum basin. If a glass vessel is used, 2 grams of zinc must be taken. The reduced mass is collected on a weighed filter, dried and weighed; the lead is then extracted by means of dilute nitric acid, and the residual gangue weighed; the metal may, of course, also be estimated in the filtrate as sulphate.

Other lead ores and compounds may be assayed in a similar manner.

L. DE K.

Analysis of Lead and Tin Ores, also of the most important Lead and Tin Preparations and their Commercial Products. By H. MENNIOKE (*Chem. Centr.*, 1900, ii, 594; from *Zeit. öffentl. Chem.*, 6, 266).—Cassiterite cannot be completely dissolved by hydrochloric acid and zinc, so must be fused with soda and sulphur. The stannous tin in stannous chloride may be estimated by adding an excess of ferric chloride, and titrating the ferrous salt by permanganate; the total tin, by reduction with hydrochloric acid and zinc. Granulated tin is washed repeatedly with water, and then boiled with an excess of ferric chloride, or it may be dissolved in concentrated hydrochloric acid, precipitated with zinc, redissolved, oxidised with chlorate, and, after expelling chlorine, precipitated by ammonium nitrate. Tin-bronze, mosaic silver, mosaic gold, and similar products may be reduced with zinc and hydrochloric acid, noting that 2.2 milligrams of tin remain unprecipitated by zinc.

M. J. S.

New Volumetric Method for the Estimation of Copper. By SAMUEL W. PAER (*J. Amer. Chem. Soc.*, 1900, 22, 685—689).—The solution which contains the copper in the state of nitrate should also contain a small quantity (not exceeding 1 per cent.) of free nitric acid. The metal is now precipitated by heating on the water-bath and adding sulphurous acid and a slight excess of potassium thiocyanate. When the precipitated cuprous thiocyanate has completely subsided, it is collected on an asbestos filter and well washed. The asbestos is returned to the beaker and the whole heated to 70° with a few c.c. of 10 per cent. aqueous sodium hydroxide. Standard potassium permanganate is then added in amount sufficient to completely oxidise the cuprous oxide, shown by the liquid assuming a permanent green tint; excess of dilute sulphuric acid (1:5) is added, and when the liquid has become clear the titration is completed at 70°. Seven mols. of potassium permanganate represent 10 atoms of metallic copper. L. DE K.

Estimation of Copper Sulphate. By MARIO ZECCHINI (*L'Orosi*, 1899, 22, 372—376).—For the rapid valuation of copper sulphate for agricultural purposes, the author recommends a method based on the reduction of the salt by means of excess of sodium thiosulphate, the cuprous salt formed being then precipitated by ammonium thiocyanate and the excess of thiosulphate determined by titration with iodine solution. Details are given of the method, which gives results in good agreement with those obtained by electrolysis. T. H. P.

Volumetric Estimation of Corrosive Sublimate in Dressings. By F. UTZ (*Chem. Centr.*, 1900, ii, 690; from *Pharm. Zeit.*, 45, 626).—The author modifies Lehmann's method (this vol., ii, 443) as follows: 100 c.c. of the solution, prepared in the usual way, are mixed with 5 to 10 c.c. of hydrogen peroxide and excess of *N*/100 alkali. The mixture is shaken, gently warmed, and the excess of alkali titrated. The reaction is $\text{HgCl}_2 + 3\text{H}_2\text{O}_2 + 2\text{KOH} = \text{Hg} + 2\text{KCl} + 2\text{O}_2 + 4\text{H}_2\text{O}$. Correction must be made for any acidity of the hydrogen peroxide. M. J. S.

Estimation of Aluminium. By EUGENE T. ALLEN and V. H. GOTTSCHALK (*Amer. Chem. J.*, 1900, 24, 292—304).—The precipitate obtained by decomposing sodium or potassium aluminate with carbon dioxide is a basic aluminium carbonate of approximately the composition $\text{OH} \cdot \text{AlCO}_3 \cdot 7\text{Al}(\text{OH})_3 \cdot 9\text{H}_2\text{O}$, contaminated with small quantities of alkali carbonate; the latter is completely removed on boiling with water containing a little ammonium chloride or nitrate, the precipitate changing in this process to the hydroxide. The latter, prepared in this way, is dense and can be filtered and washed much more rapidly than the hydroxide precipitated by ammonia. The following method of estimating aluminium is more rapid than the old one, whilst at least as accurate.

The substance is dissolved either in water or a mineral acid, in the latter case the excess of acid being nearly neutralised with ammonia; a solution of 1 to 2 grams of potassium hydroxide, in which the amount of silica, iron, and alumina is known, is then added until

the precipitate first formed is redissolved ; an excess of alkali should be avoided. Carbon dioxide is then passed in until precipitation is complete, 20 minutes, as a rule, sufficing for 0.2 gram of alumina ; the precipitate is for the most part transferred to a filter paper, washed with water, and then washed back into the original beaker, where it is boiled for 2 to 3 minutes with 150—200 c.c. of water containing a little pure ammonium chloride or nitrate. After settling, the precipitate is collected on a filter-paper, using a pump and cone, washed by decantation with hot water, burned, and, after heating for 10 minutes in the blowpipe flame, weighed ; the hygroscopic nature of alumina renders it necessary to heat again, after the first approximate weighing, and weigh very rapidly.

The method is as accurate as the old one for iron and alumina occurring together, and, with a large proportion of the latter, is preferable ; it is accurate in the presence of sulphates, whilst the old method gives high results. When, however, alkaline earths or lithium are present, it is not applicable.

W. A. D.

Estimation of Alumina as Phosphate in Ore and Blast-furnace Cinder. By J. M. CAMP (*Chem. News*, 1900, 82, 9—10).—A gram of the ore or cinder is treated for silica, and the cold hydrochloric acid filtrate is diluted to about 400 c.c. and treated with 30 c.c. of a 10 per cent. solution of ammonium phosphate and then with ammonia until a faint precipitate forms ; 1.5 c.c. of strong hydrochloric acid are added, and for ores 50 c.c., for cinder 30 c.c. of a 20 per cent. solution of sodium thiosulphate. The mixture is heated to boiling, 8 c.c. of strong acetic acid and 15 c.c. of 20 per cent. solution of ammonium acetate are added, and the whole boiled for 10 minutes, allowed to subside, the clear solution decanted, precipitated, filtered, and washed on the filter with hot water 10 times, but not more, as aluminium phosphate is slightly soluble. The precipitate is ignited in a platinum crucible in front of the muffle until the paper chars, then finished in the hottest part ; 41.85 per cent. of the weight is alumina.

D. A. L.

Relative Values of the Mitscherlich and Hydrofluoric Acid Methods for the Estimation of Ferrous Iron. By WILLIAM F. HILLEBRAND and HENRY N. STOKES (*J. Amer. Chem. Soc.*, 1900, 22, 625—630).—Mitscherlich's process, heating the ferruginous substances with a mixture of 3 parts of sulphuric acid and 1 part of water in a sealed tube from which the air has been expelled, gives utterly untrustworthy results in the analysis of ferruginous rocks when sulphides are also present. Owing to the high temperature, 160—200°, to which the tube is exposed, the sulphur is oxidised at the expense of any ferric oxide present and thus causes an apparent increase in the ferrous iron.

The hydrofluoric method is not affected by the presence of moderate quantities of sulphides.

L. DE K.

Estimation of Pyrrhotite in Pyrites Ore. By F. B. CARPENTER (*J. Amer. Chem. Soc.*, 1900, 22, 634—637).—Two grams of the sample, ground sufficiently finely to pass through a 100-mesh sieve, are boiled in a covered beaker with 30 c.c. of strong hydrochloric acid for

10 minutes; the insoluble portion is then collected on a weighed Gooch crucible, washed successively with warm dilute hydrochloric acid, hot water, and alcohol, and then repeatedly with small portions of carbon disulphide. After drying at 100° , the residue consisting of iron disulphide and silica is weighed and by deducting the amount of the latter, previously ascertained, the weight of the former is found. The sulphur present in the iron disulphide is subtracted from the total sulphur previously determined and the difference is calculated to pyrrhotite (Fe_7S_8). The presence of pyrrhotite may be ascertained by means of a magnet.

If zinc or copper sulphides are present in appreciable quantities an allowance must be made for the sulphur they contain. Zinc which is present as normal sulphide will be completely dissolved by the hydrochloric acid. Copper, however, may remain in the residue in the form of double copper iron sulphide (CuFeS_2) and its amount should be allowed for.

L. DE K.

Estimation of Cobalt in New Caledonian Ores. By THOMAS MOORE (*Chem. News*, 1900, 82, 66—67).—These ores consist mainly of hydrated oxides of manganese iron, aluminium, cobalt, and nickel, with relatively small proportions of calcium, magnesium, zinc, lithium, &c., and occasionally barium and copper. The cobalt only is determined, usually by electrolytic deposition or precipitation as ammonium cobalt phosphate. The ores contain from traces to 8 per cent.

In the author's method 2.5 grams of pulverised and dry ore are dissolved in hydrochloric acid, the solution evaporated to a syrup, and all soluble matter dissolved by adding water; 100 c.c. of a saturated solution of ammonium chloride are then added and the whole diluted to 400 c.c.; a solution of 1 part of strong ammonia in 15 of water is carefully but vigorously stirred in until the liquid becomes deep red, when 5 per cent. solution of sodium carbonate is dropped in until the liquid has only a slightly yellow tint. A further dilution to 500 c.c. follows, the whole being well shaken and filtered. Four hundred c.c. of the filtrate are heated to near the boiling point with 20 c.c. of saturated sodium acetate and 10 c.c. of acetic acid, and hydrogen sulphide is passed until nearly cold; the precipitate of cobalt, nickel, and zinc sulphides is filtered, washed with water containing hydrogen sulphide, dried, and ignited, then dissolved in hydrochloric acid with a little nitric acid, the latter being eliminated by twice evaporating with hydrochloric acid. The chlorides are dissolved in water, any iron removed by an emulsion of zinc oxide, the filtrate made up to 50 c.c., mixed with 10 to 15 c.c. of 10 per cent. hydrogen peroxide, then with 10 c.c. of 10 per cent. sodium or potassium hydroxide, boiled to remove excess of hydrogen peroxide, cooled, digested with potassium iodide and hydrochloric acid, and titrated with sodium thiosulphate (iodine $\times 0.46511$ = cobalt).

D. A. L.

Separation and Estimation of Small Quantities of Cobalt in the Presence of Nickel. By THOMAS MOORE (*Chem. News*, 1900, 82, 73).—The solution containing the chlorides of nickel and cobalt, after removal of any iron by means of zinc oxide and filtration, is diluted, heated nearly to boiling with a drop of hydrochloric acid,

then treated with bromine water and zinc oxide, boiled to expel most of the bromine, and filtered. The washed precipitate is stirred with a solution of hydrogen peroxide and sodium hydroxide, boiled to destroy excess of the peroxide, cooled, digested with potassium iodide and hydrochloric acid, and titrated with sodium thiosulphate, $I \times 0.46511 =$ Co.

D. A. L.

Qualitative Separation of Nickel from Cobalt by the Action of Ammonium Hydroxide on the Ferricyanides. By PHILIP E. BROWNING and JOHN B. HARTWELL (*Amer. J. Sci.*, 1900, [iv], 10, 316—317).—The difficulties in F. W. Clarke's method (*ibid.*, 1894, [iii], 48, 67) of separating nickel from cobalt by precipitating as ferricyanides and extracting the nickel with strong ammonia, are caused by the passage of cobalt ferricyanide through the filter and by the separation of sulphur in the subsequent precipitation of the nickel with ammonium sulphide. The method works well, however, if a few drops of a solution of alum are added before precipitating the ferricyanides, and if the nickel is subsequently precipitated with sodium or potassium hydroxide; in this way, less than a milligram of nickel can be clearly detected.

T. M. L.

Separation of Cobalt and Nickel by means of Persulphates. By F. MAWROU (*Zeit. anorg. Chem.*, 1900, 25, 196—200).—According to the author's previous work (this vol., ii, 596), the separation of cobalt and nickel by means of persulphates, as described in Salomon and Coehn's patent (*Zeit. Elektrochem.*, 1900, 6, 43, 532), is not quantitative. In the case of the mixed salts of the two metals, the precipitate of cobalt oxide contains a small quantity of nickel and a small quantity of cobalt remains in solution, whilst if the mixed hydroxides are employed, they are both only partially converted into higher oxides, and on the addition of acids to the black precipitate both cobalt and nickel are dissolved.

E. C. R.

Analysis of Chrome-Iron Ore by the Borax Method. By R. W. EMERSON MACIVOR (*Chem. News*, 1900, 82, 97).—To prepare chrome-iron ore for analysis, the author strongly recommends Dittmar's process, which he describes as follows: 4 grams of a mixture of 3 parts of sodium potassium carbonate and 2 parts of borax, are fused in a platinum crucible, allowed to solidify, 0.5 gram of the ore (which must be ground to an impalpable powder) placed on the top of the mass, the whole fused with the lid on, then the crucible placed at an angle on the triangle, heated, and the contents stirred with a platinum wire for half an hour, allowed to solidify, and then fused again with 2.5 grams of sodium potassium carbonate. The mass is heated with water on a water-bath, filtered, and the chromates washed out.

D. A. L.

Analysis of Chrome and Tungsten Steels. By ALEXANDER G. M'KENNA (*Chem. News*, 1900, 82, 67—68).—The steel is heated with hydrochloric acid, and the evolved gas absorbed in a solution of ammonium cadmium chloride for the estimation of sulphur. The hydrochloric acid solution is heated with nitric acid, twice evaporated to dryness with hydrochloric acid, dissolved in the same acid, diluted, and the residue of tungstic acid and silica dried, weighed, and treated with hydrofluoric acid to remove silicon. It is then weighed again, fused with sodium carbon-

ate, extracted with hot water, and any residue of iron oxide weighed. The hydrochloric acid solution is concentrated, boiled with some nitric acid to drive off hydrochloric acid, and then with large quantities of the same acid and potassium chlorate; the precipitate is dissolved in hydrochloric acid, the solution treated with ammonia and ammonium acetate, and the manganese precipitated with bromine. The chromium is determined in the nitric acid solution by diluting and titrating with ferrous sulphate and permanganate. The phosphorus and carbon may be estimated in the usual way in separate portions of the steel. D. A. L.

Estimation of Molybdenum in Steel and Steel-making Alloys. By FRED IBBOTSON and HARRY BREARLEY (*Chem. News*, 1900, 81, 269—271).—Steel, or ferromolybdenum, containing small proportions of molybdenum is dissolved in hydrochloric acid, in quantities of about 2 grams, and oxidised with nitric acid or potassium chlorate, the solution neutralised, or nearly so, with sodium carbonate, avoiding the formation of a red coloration or precipitate, and passed through a small pulp filter, which is then placed in a flask containing 2*N* sodium hydroxide to the extent of 30—40 c.c. in excess of that required to precipitate all the iron. When the filter is disintegrated, the contents of the flask are heated nearly to boiling, well agitated, fractionally filtered, acidified with hydrochloric acid, and the molybdenum precipitated as lead molybdate in the manner previously described (*Abstr.*, 1899, ii, 129).

The presence of molybdenum in steel does not affect the estimation of silicon, or of manganese when no large excess of ammonium acetate is used to precipitate the iron, or when six instead of three separate lots of chlorate are added in the volumetric method by oxidation with potassium chlorate in nitric acid solution; or of sulphur if the barium chloride is added to a distinctly acid solution; or of phosphorus if the long (acetate) method is followed, or in the rapid method when dissolving in ammonia and precipitating with magnesia mixture is adopted. Carbon in the residue obtained by treating the sample with copper solutions retains some molybdic oxide. In the presence of molybdenum, iron cannot be estimated gravimetrically, or by simple solution and titration, but reduction with sulphurous acid and titration with potassium dichromate or permanganate is effective. Nickel-molybdenum containing but little iron is dissolved in aqua regia, the solution poured into excess of ammonia, and the molybdenum precipitated from a portion of the filtrate, whilst the nickel is determined in another portion cyanometrically. If more than a few tenths per cent. of iron is present, a second precipitation is necessary, and the filtrates are mixed before determining the nickel and the molybdenum; with much iron, the molybdenum must be separated by means of sodium hydroxide as in the case of steels, and the nickel and iron separated afterwards in a fresh sample by means of ammonia.

Molybdenum powders have been found to contain metallic molybdenum and its oxide, tungsten and its oxides, silica, alumina, iron, ferric oxides, combined and free carbon, sulphur, and water. The total carbon and combined carbon may be determined in the usual manner, the molybdenum by heating carefully with sodium carbonate and potassium nitrate under sodium carbonate in a platinum crucible, over

a blowpipe, avoiding volatilisation of molybdenum as oxide, extracting with water, and precipitating with lead acetate, &c., as previously set forth (this vol., ii, 445). Methods are also suggested for determining the quantity of oxides present in the powder. D. A. L.

[Estimation of small quantities of Platinum in Gold.] By HEINRICH RÖSSLER (*Chem. Zeit.*, 1900, 24, 733—735).—See this vol., ii, 733.

Volumetric Estimation of Iodoform in Dressings. By MARTIN LEHMANN (*Chem. Centr.*, 1900, ii, 397; from *Pharm. Zeit.*, 45, 522—523).—The author has slightly modified his process (this vol., ii, 372.) Ten grams of the material are treated in a glass stoppered bottle with 200 c.c. of "Spiritus æthereus" for 24 hours at 20—25° with constant agitation; 20 c.c. of the solution are then treated as previously directed. L. DE K.

Testing Lemonade Essences. I. Essence of Lemon and of Bitter Orange. By NEUMAN WENDER and GEORG GREGOR (*Zeit. Nahr. Genussm.*, 1900, 3, 449—459).—The article is chiefly a review of the various methods in use for estimating the amount of alcohol and ethereal oils.

Alcohol may be estimated by Schade's salt process, but the authors prefer the method proposed by Hefelmann (*Abstr.*, 1897, ii, 605). In many cases, the simple determination of the sp. gr. of the sample answers the purpose. Ethereal oil is best estimated by a process communicated by Mann which consists in observing the diminution in volume, when the sample is diluted largely with water containing a little sulphuric acid, and then shaken with light petroleum.

The solubility of the essences in water is determined by the authors as follows. One c.c. of the sample is put into a tall graduated cylinder and water at 17.5° is gradually added with constant shaking until a perfectly clear solution is obtained.

Admixture of oil of lemon or bitter orange or of citral may be detected by the lessened solubility in water, and the polarisation of the petroleum extract. Vanillin may be isolated by evaporating off the alcohol, adding lead acetate, and shaking the filtrate with ether. The vanillin is then removed by shaking with dilute ammonia, the liquid is acidified with hydrochloric acid, and the vanillin again extracted with ether; finally, the phloroglucinol test is applied. L. DE K.

Separation of Oleic Acid from other Unsaturated Acids. By K. FARNSTEINER (*Zeit. Nahr. Genussm.*, 1900, ii, 3, 537—539. Compare *Abstr.*, 1899, ii, 705).—A reply to Lewkowitsch (this vol., ii, 376). L. DE K.

Estimation of Lactic Acid in the Commercial Article. By FERDINAND JEAN (*Chem. Centr.*, 1900, ii, 692; from *Ann. Chim. anal. appl.*, 5, 285).—Commercial lactic acid contains mineral acids, oxalic acid, volatile organic acids, and various salts. A known quantity is freed from volatile acids by repeatedly evaporating with water, then boiled with barium carbonate, and the filtered solution

evaporated and gently ignited. The barium carbonate in the ash is thoroughly washed, dissolved in a known excess of standard hydrochloric acid, and the excess titrated back 1 c.c. of *N*/10 acid = 0.009 gram of lactic acid. M. J. S.

Detection and Estimation of Acetoacetic Acid in Pathological Urine. By V. ARNOLD (*Chem. Centr.*, 1900, 345—346; from *Centr. inn. Med.*, 21, 417—423).—The characteristic test for acetoacetic acid with diazoacetophenone described by the author (this vol., ii, 113) is best applied to urine previously decolorised with animal charcoal. All samples which give Legal's acetone reaction also give a positive diazoacetophenone test. Ehrlich's *p*-diazobenzenesulphonic acid cannot be used instead. Salts of acetoacetic acid differ from ethyl acetoacetate in their behaviour with the latter reagent; they cause a light yellow colour, which turns deep red or dark purple on adding ammonia, whilst the ester gives an orange-red colour changed to pure red by ammonia. On the other hand, when using the author's reagent, the ammoniacal solution of salts of acetoacetic acid is brownish-red with a similarly coloured precipitate, and that of ethyl acetoacetate vermilion-red with a similarly coloured, finely granular precipitate. The precipitates are soluble in strong hydrochloric acid, with a purple-violet colour. If the freshly prepared solution of diazoacetophenone is so much diluted that addition of ammonia does not cause a yellow coloration and a salt of acetoacetic acid is then added, a passing yellow coloration is observed gradually turning into a dark purple violet, which, after a few minutes, fades and turns yellow again; ethyl acetoacetate gives at once a reddish-yellow coloration.

According to the author, acetone does not pre-exist in urine; the reaction obtained is due to acetoacetic acid. L. DE K.

Estimation of Potassium Hydrogen Tartrate in Wine. By LOUIS MAGNIER DE LA SOURCE (*Chem. Centr.*, 1900, ii, 692; from *Ann. Chim. anal. appl.*, 5, 281).—In attempting to estimate the potassium hydrogen tartrate by Berthelot and Fleurieu's method (precipitation by a mixture of alcohol and ether), complete precipitation is not obtained unless there is an excess either of tartaric acid or of a potassium salt. The author recommends that the latter should be added in the form of potassium bromide, of which a large excess is not injurious. M. J. S.

Estimation of Malic Acid. By ALBERT HILGER (*Chem. Centr.*, 1900, ii, 597—598; from *Verh. Vers. Deut. Naturf. und Aerzte*, 1899, 668).—Malic acid precipitates metallic palladium (0.294 gram of metal per gram of acid) from neutral or feebly alkaline solutions of palladium chloride. Glycerol and glycollic acid have the same effect, but tartaric, citric, succinic, and oxalic acids have no action. To estimate malic acid in wine, the alcohol and volatile acids are distilled off, colouring matters and tannic acid removed by charcoal, and the fruit acids then precipitated by basic lead acetate. The precipitate is dissolved in acetic acid, and the lead removed by a small excess of sodium carbonate; a 2 per cent. solution of palladium chloride is added, and then sodium carbonate to exact neutrality; the palladium separates

on shaking. The mixture is feebly acidified, heated for $1\frac{1}{2}$ hours on the water-bath, and the metal collected and dried. Tartaric acid reduces platinic chloride, malic acid does not.

M. J. S.

Uric Acid and Purine Bases in the Blood and Animal Organs. By WILHELM HIS, jun., and W. HAGEN (*Zeit. physiol. Chem.*, 1900, 30, 350—383).—The estimation in the blood and extracts of organs of uric acid and the various purine bases is difficult on account of the proteid present. The precipitation of guanine with ammoniacal silver solutions is hindered by small quantities of albumose; if large quantities are present, they are partially precipitated with it. Removal of the albumoses by ammonium sulphate or by trichloroacetic acid does not interfere with the subsequent precipitation of the bases by ammoniacal silver solution; zinc sulphate, however, does; but even with the ammonium sulphate method, there is considerable loss of the bases. Besides albumoses, other substances, such as nucleic acid, interfere with the results; in fact, in extracts of organs much worse results are obtained than in artificial mixtures. The lead acetate method, also, is untrustworthy. Much the same is true for uric acid, and the best results were obtained by employing Stad-hagen's method of extracting the organs with 0.5 per cent. sulphuric acid.

W. D. H.

Detection of Salicylic Acid in Presence of Citric Acid. By A. CONRADY and by OTTO LANGKOPF (*Chem. Centr.*, 1900, ii, 596; from *Apoth. Zeit.*, 15, 412, 462; *Pharm. Centr.*, 41, 411, 464).—Langkopf (this vol., ii, 695) has stated that citric acid prevents the reaction between ferric chloride and salicylic acid, and recommends a preliminary extraction of the latter with a mixture of ether and light petroleum. CONRADY considers that the failure to produce a violet colour is due to reduction of the ferric salt, since it can be developed by adding an oxidising agent (nitric acid or hydrogen peroxide).

LANGKOPF replies to Conrady that ferric chloride is not reduced by citric or tartaric acid, and denies that the violet colour is developed by adding nitric acid or hydrogen peroxide.

CONRADY, in rejoinder to Langkopf, states that he worked with a 1 per cent. solution of salicylic acid, Langkopf having employed one of only 0.1 per cent., and admits that below 1 per cent. the addition of an oxidising agent is ineffectual.

LANGKOPF states that the explanation of Conrady's results is, that on mixing ferric chloride with citric acid, ferric citrate is produced which has no action on salicylic acid. The addition of any strong acid prevents the formation of ferric citrate. Conrady's hydrogen peroxide probably contained free sulphuric acid.

M. J. S.

Detection of Salicylic Acid in the Presence of Citric Acid. By J. E. GEROCK (*Chem. Centr.*, 1900, ii, 597; from *Pharm. Centr.*, 41, 464).—With reference to the controversy between Langkopf and Conrady, it is to be observed that all soluble acids are capable of preventing the ferric reaction of salicylic acid if present in sufficient excess. The violet coloured substance is to be regarded as salicylic acid in which the hydrogen of a hydroxyl group is replaced

by triatomic iron, and it is not formed if another acid, even citric, is present, for which iron has a greater affinity. M. J. S.

Detection of Salicylic Acid in Presence of Citric Acid. By A. KLETT (*Chem. Centr.*, 1900, ii, 545; from *Pharm. Centr.*, 41, 452).—Jorissen's method for detecting salicylic acid in beer serves equally well for lemon juice. Ten c.c. of the juice are mixed with 4 drops of a 10 per cent. solution of sodium nitrite, 4 drops of acetic acid, and 1 drop of a 10 per cent. copper sulphate solution, and heated to boiling. Salicylic acid produces a blood red coloration, which is best observed just as the liquid begins to boil. M. J. S.

Detection of Salicylic Acid in Milk. By P. STÖSS (*Chem. Centr.*, 1900, ii, 545; from *Pharm. Centr.*, 41, 437).—The presence of 0.2 per cent. of citric acid does not prevent the detection of 0.005 gram of salicylic acid in 100 c.c. of milk.

One hundred c.c. of milk are coagulated by warming at 80° with 1.5 c.c. of a 20 per cent. solution of calcium chloride, and the filtrate allowed to drop through 50 c.c. of ether, which is then evaporated in a porcelain basin and tested by running in from the edge 1—2 drops of dilute ferric chloride-solution diluted with 10 c.c. of water.

M. J. S.

Estimation of Hippuric Acid. By FERDINAND BLUMENTHAL (*Chem. Centr.*, 1900, ii, 447; from *Zeit. klin. Med.*, 40, 3—4).—Three hundred c.c. of human urine are rendered alkaline with sodium carbonate and evaporated to dryness. The residue is extracted twice with 150 c.c. of 96 per cent. alcohol on a warm water-bath, and the alcoholic filtrate evaporated to a syrup. This is dissolved in 50 c.c. of water, acidified with 10 c.c. of 20—25 per cent. hydrochloric or sulphuric acid, and shaken with 200 c.c. of ether containing 20 c.c. of alcohol; the ethereal layer is then shaken with 75 c.c. of water and finally distilled. The extraction is repeated four times, and the ether residues are then dissolved in 20 c.c. of water and introduced into a Kjeldahl flask. (If much colouring matter is present, it is removed by shaking the solution in a separating funnel with 15 c.c. of chloroform.) The nitrogen is then estimated in the usual manner, and from its amount the hippuric acid is calculated.

The process is attended with a loss of about 15 per cent. of the hippuric acid present, but suffices for the comparative clinical examination of urine.

L. DE K.

A Multiple Fat Extractor. By CHARLES L. PENNY (*Amer. Chem. J.*, 1900, 24, 242—249).—The apparatus is a modification of the Soxhlet extractor. Its essential part is a chamber made of a nearly horizontal brass cylinder 2 inches and a half in diameter and 30 inches long, wherein may be placed a semicircular rack holding 51 shallow capsules containing the samples to be extracted. The cylinder has a capacity of about 2400 c.c. The other parts of the apparatus are a vessel in which the extracting liquid is boiled by means of steam passing through lead coils, block tin condensers, and the usual syphoning arrangement.

The milk is dried in the capsule with addition of coarse sand or

asbestos; after being weighed, the capsule is placed in the extractor, ether, or better, light petroleum boiling below 100° , being used as the extracting liquid. The capsule is then dried and reweighed, the loss representing the fat. Cream or butter must be absorbed in asbestos or glass wool.

L. DE K.

Variation in Milk Solids; Control of Milk Supply. By A. REINSCH and H. LÜHRIG (*Zeit. Nahr. Genussm.*, 1900, 3, 521—524).—The authors communicate fifty experiments from which it again appears that milk, even before it actually turns sour, may apparently have lost as much as 0.6 per cent. of solids owing to decomposition. This does not, however, affect the sp. gr. of the milk, so that as a rule more trustworthy results are obtained by calculating the total solids from the sp. gr. and the fat than by a direct estimation. From this it also follows that it is very risky to calculate the fat from the sp. gr. and the solids actually determined.

When dealing with sour milks not more than 3 days old, the sp. gr. of the serum should be taken as affording the only safe evidence as to the addition of water. It is also incidentally remarked that total solids cannot be accurately estimated in sour milk liquefied with ammonia.

L. DE K.

Estimation of Fat in Condensed Milk. By ALBERT E. LEACH (*J. Amer. Chem. Soc.*, 1900, 22, 589—591).—Forty grams of the well-mixed sample are diluted with water and made up to 100 c.c. and 25 c.c. of this solution introduced into an ordinary Babcock test-bottle. After nearly filling with water, 4 c.c. of a 7 per cent. solution of copper sulphate are added and the whole is whirled, preferably without heating, to make the precipitate settle. The supernatant liquid is then drawn off with a pipette, over the bottom of which a small wisp of absorbent cotton is first twisted to serve as a filter; this is afterwards wiped off into the bottle by rubbing against its inner side.

The precipitate which contains all the fat is washed twice to remove all cane sugar, water is then added to represent the usual volume of milk used in the experiment, and the usual Babcock sulphuric acid process applied. The result of the reading multiplied by 1.8 equals the percentage of fat.

L. DE K.

Estimation of Fat in Sweetened Condensed Milk. By JOSEPH F. GEISLER (*J. Amer. Chem. Soc.*, 1900, 22, 637—645).—Fat in condensed milk may be estimated with reasonable accuracy by the Adams' or coil process, provided not more than 1 gram of the sample is operated on, and that the extraction is continued for about 5 hours.

Light petroleum of low boiling point, or a mixture of 15 per cent. of this with dry ether, is recommended as the extracting liquid.

L. DE K.

Estimation of Fat in Sweetened Condensed Milk by the Babcock Test. By E. H. FARRINGTON (*Amer. Chem. J.*, 1900, 24, 267—270).—When estimating fat in condensed milk by the centrifugal methods, it is advisable to first remove the added sugar as this

causes a very unsatisfactory reading of the fatty layer (compare preceding abstracts). 40—60 grams of the sample are weighed into a 200 c.c. flask, about 100 c.c. of water are added to dissolve the milk, and after diluting to the mark and shaking, 17.6 c.c. are measured into a Babcock test-bottle. Three c.c. of sulphuric acid are added and the bottle is whirled for 6 minutes in a steam-heated turbine centrifuge at a speed of 1000 revolutions.

The whey is now poured off, 10 c.c. of water and 3 c.c. of acid are added, the curd is well shaken and the bottle whirled a second time; this treatment practically removes all the sugar and after pouring off the washings, the residual curd and fat are treated with 10 c.c. of water and 17.5 c.c. of sulphuric acid and the operation conducted as in the case of an ordinary milk. L. DE K.

Estimation of the Volatile Acids in Butter by Leffmann-Beam's Glycerol-Soda Process. By ANTON SKYDA (*Chem. Zeit.*, 1900, 24, 752—753).—The amount of sulphuric acid stated to be sufficient to decompose the soap when butter is saponified with Leffmann-Beam's solution of sodium hydroxide in glycerol has been found by the author to be often insufficient. The amount should be doubled and a correspondingly smaller quantity of water used to dissolve the soap. In the case of doubtful results, it is advisable to check the work by the ordinary Reichert-Meissl process. L. DE K.

Chemical Action of Mould on Butter. By JOS. HANUŠ and ALB. STOKČÍ (*Zeit. Nahr. Genussm.*, 1900, 3, 606—614).—A series of experiments with nine different kinds of fungus on butter for various lengths of time.

In the first experiment the butter was inoculated with the fungi and exposed in thin layers to moist air in the dark. After three months the various portions and also the non-inoculated original were analysed in the usual way. From the figures recorded it appears that the effect of the different fungi is practically the same; the only figure seriously affected is the acidity number, which was raised some 24 degrees.

In another experiment which lasted one year, the sample was inoculated with *Mucor mucedo* and the only figures notably affected were the saponification and ether numbers and the molecular weight of the free volatile acids. Further experiments have shown that the fungi at first thrive on the casein and lactose and then live at the expense of the glycerol; they also cause the oxidation of the lower volatile acids contained in the liberated fatty acids. L. DE K.

The Halphen Colour Test and its Value for the Detection of Cotton Seed Oil. By ROZIER D. OILAR (*Amer. Chem. J.*, 1900, 24, 355—373).—To dispense with the use of amyl alcohol and a bath of boiling aqueous sodium chloride in the Halphen test (Abstr., 1898, ii, 358) is a disadvantage rather than an advantage as claimed by Soltsien (Abstr., 1899, ii, 323); ethyl alcohol gives a less pronounced coloration than amyl alcohol. The examination of a large number of the common oils and fats shows that the test is given by cotton seed oil alone, and the value of the reaction is enhanced by the fact that none

of the ordinary colouring matters or adulterants responds to it. The test is capable of indicating rather less than 0.1 per cent. of cotton-seed oil in fresh, colourless lards, and is very pronounced with 1 per cent. of the oil. The test can be used more or less quantitatively by comparing the depths of colour produced with those obtained with equally concentrated volumes of known mixtures of lard and cotton seed oil; the results are most satisfactory with lards containing less than 1 per cent. of the oil (compare Strzyzowski, this vol., ii, 325).

W. A. D.

Maripa Fat. By W. P. H. VAN DEN DRIESSEN MAREEUW (*Chem. Centr.*, 1900, ii, 637—638; from *Ned. Tijds. Pharm.*, 12, 245—249).—Maripa fat, obtained by boiling or pressing the fruit of *Palma maripa*, is colourless or faintly yellow, has a slight taste and pleasant odour, and is used in the West Indies instead of butter. It has a sp. gr. 0.8686 at 100°, melts at 26.5—27°, solidifies at 24—25°, and has an acid number 31.095, saponification number 270.5, ether number 239.40, Hehner number 88.88, Reichert-Meissl number 4.45, and Hübl's iodine number 17.35. The fatty acids melt at 27.5—28.5°, solidify at 25°, and have a sp. gr. 0.823, and Hübl's iodine number 12.15.

E. W. W.

Simple Analysis of Wool Fat. By HUGO BORNTÄGER (*Zeit. anal. Chem.*, 1900, 39, 505).—Wool fat consists mainly of oleic, stearic, margaric, and palmitic acids, with small amounts of water and insoluble impurities. A gram of the fat is dried at 110° to estimate water, then dissolved in 50 c.c. of hot absolute alcohol, and the insoluble matter collected on a weighed filter. The alcoholic filtrate and washings are concentrated to 50 c.c. and left at rest for 24 hours in the cold. The solid fatty acids crystallise out and are weighed, after washing three times with cold alcohol and drying at 105°. The remainder is regarded as oleic acid.

M. J. S.

Estimation of Aldehydes by Means of Hydrazines. I. **Estimation of Vanillin.** By JOS. HANUŠ (*Zeit. Nahr. Genussm.*, 1900, 3, 531—537).—The aqueous solution of vanillin is mixed with a hot solution of *p*-bromophenylhydrazine in such proportion that 2—3 parts of the hydrazine will be present for 1 part of vanillin. After 4—5 hours, the crystalline precipitate is collected in a weighed Gooch crucible containing asbestos, washed with hot water, dried at 100° and weighed. One part of vanillin yields 2.105 parts of the hydrazine compound.

Experiments with other aldehydes are in progress.

L. DE K.

Detection of Aldehyde in Vinegar prepared by Fermentation. By CARL BÖTTINGER (*Chem. Zeit.*, 1900, 24, 793—794).—Vinegars prepared by fermenting alcoholic liquors always contain traces of aldehyde, whereas diluted acetic acid made to resemble vinegar is devoid of that substance.

The aldehyde may be tested for in the usual manner by pouring some of the vinegar on to a solution of a few milligrams of resorcinol in 4 c.c. of sulphuric acid contained in a test-tube, and noticing the characteristic ring at the place of contact. It is remarkable that

when dealing with a true fermentation vinegar, the reaction may also be obtained, although in a lesser degree, with the residue left on evaporation ; this, of course, cannot contain any free aldehyde, but may contain a non-volatile compound of it. L. DE K.

New Colour Reaction for Citral and certain other Aromatic Compounds. By HERBERT E. BURGESS (*Analyst*, 1900, 25, 265—266).—Ten grams of mercuric sulphate are dissolved in, and made up to 100 c.c. with, 25 per cent sulphuric acid. Two c.c. of the substance to be tested are put into a small phial fitted with a cork, 5 c.c. of the reagent are added, the whole is vigorously shaken and the colour noticed at once, and also after 10 minutes. The following reactions are characteristic : Cinnamaldehyde, formaldehyde, acetaldehyde, benzaldehyde, and anisaldehyde give no reaction. Citral gives a transient, bright red coloration, and a whitish compound floating on the surface ; citronellal a fairly permanent yellow coloration ; limonene faint flesh coloration which instantly disappears ; linalyl acetate a permanent brilliant violet coloration ; linalool a deep violet coloration ; caryophyllin a yellowish coloration ; eugenol a slight violet coloration after a time, and terpineol a flesh coloration and precipitate.

Oil of cassia gives a yellowish compound floating on the surface and no reduction on shaking. Oil of cinnamon forms a brown compound and a slight violet-coloured aqueous layer ; after a time the whole becomes a solid black mass. Oil of cloves gives a violet aqueous layer which becomes darker when kept. L. DE K.

Chemicotoxicology of Sulphonal and Analogous Compounds. By DIOSCORIDE VITALI (*Chem. Centr.*, 1900, ii, 646—647 ; from *Boll. Chim. Farm.*, 39, 461, 497).—To isolate sulphonal from an organic liquid, the liquid is evaporated to dryness, extracted with hot 90 per cent. alcohol, the alcoholic extract filtered after cooling, and distilled. The residual aqueous liquid is filtered while hot, made feebly alkaline with potassium hydroxide, and shaken with ether. The ethereal solution when evaporated leaves a colourless residue of sulphonal, easily recognised under the microscope by the characteristic dendritic form of its crystals. The reactions proposed by Schwartz, Vulpius and others depending on fusion with alkali are not characteristic as they are produced by other sulphur compounds.

Sulphonal may, however, be detected by the following reactions. The substance is heated with three parts of powdered potassium hydroxide, when the liquid becomes yellow, then red, and the colour changes to blue on adding water. On acidifying with hydrochloric acid, an ephemeral violet colour is produced and sulphur separates, whilst sulphur dioxide is evolved, and a sulphate can be detected in the solution. The thiosulphate formed can also be recognised by adding potassium nitrite and an acid, when a transient, yellow colour is produced by the solution of nitric oxide in thiosulphuric acid. That a polysulphide is also formed can be shown by adding sodium nitroprusside.

The homologues of sulphonal (trional and tetronal—see Abstr., 1889, 1233) can be distinguished from sulphonal by their crystalline form and lower melting points. Sulphonal is not altered by the pre-

sence of putrefying matter. All three sulphones pass, to some extent, unchanged into the urine.
M. J. S.

Analysis of Gutta Percha. By HUGO BOENTRÄGER (*Zeit. anal. Chem.*, 1900, 39, 502—504).—Of the three substances, gutta, fluavil, and alban, of which gutta percha is composed, the last is not a chemical individual, but consists approximately of 30 per cent. of a pale resin oil boiling at 200°, 30 per cent. of a dark yellow oil boiling at 250° and 40 per cent. of a solid resin resembling colophony. For the analysis of the crude material, moisture is estimated by drying in an air current at 100°, and woody fibre and earth by dissolving 1 gram in hot benzene. The benzene solution is then concentrated to 50 c.c., mixed with 100 c.c. of absolute alcohol, and kept at 100° for 2 hours. The gutta precipitates, and is weighed after washing with hot alcohol. The alcoholic solution is concentrated to 50 c.c. and cooled in a weighed basin. The fluavil separates and is weighed after washing with cold alcohol and drying at 80°, but as it is more volatile than alban it is better to estimate it from the difference after evaporating the solution containing the alban and drying the latter at 80°
M. J. S.

Estimation of Glycyrrhizin in Liquorice Extract. By B. HAFNER (*Chem. Centr.*, 1900, ii, 501; from *Zeit. Oesterr. Apoth. Verein.*, 38, 241—244. Compare this vol., ii, 328).—The author has shown that the well-known insolubility of glycyrrhizin in dilute sulphuric acid is not due to a chemical combination. Pure glycyrrhizin can only be obtained by extraction with alcoholic sulphuric acid, coupled with purification by acetone as described in the first paper. More glycyrrhizin may apparently be extracted by means of ammoniacal water, but in that way an impure product is obtained. All samples do not yield an equally pure product.
L. DE K.

Analysis of Cayenne Pepper. By GEORG GREGOR (*Zeit. Nahr. Genussm.*, 1900, 3, 460—471).—The author has proved that the plant (*Capsicum annuum*) does not assimilate barium or lead salts when either of these has been purposely added to the soil. Should salts of these metals be found in the commercial article, it may be safely assumed that they have been wilfully added.

It is also stated that the only way of ascertaining the genuineness of cayenne pepper (the ground fruit) is by a thorough microscopic examination. A somewhat high ash does not necessarily point to adulteration; should it, however, amount to 10 per cent., it is as well to treat it with hydrochloric acid and test both the soluble and insoluble portions.
L. DE K.

Estimation of Santonin. By KARL THAETER (*Arch. Pharm.*, 1900, 233, 383—387. Compare *Abstr.*, 1898, ii, 59; 1899, ii, 619; this vol., ii, 122, 583).—The loss in the author's process is not more than about 10 per cent. As a further improvement in the method the recommendation is made that, after the boiling with milk of lime, the alkaline liquid should be slightly acidified with sulphuric acid, and warmed until crystals of santonin begin to separate, before the solution of aluminium acetate is added.
C. F. B.

Detection of Coal-Tar Dyes in Fruit Products. By A. L. WINTON (*J. Amer. Chem. Soc.*, 1900, 22, 582—588).—The author communicates his experiences with some of the recognised methods for the detection of coal-tar colours in foods.

Arata's "wool process" is satisfactory; it is, however, preferable to apply the confirmatory tests to the wool itself and not to the colouring matter obtained from it, because some coal-tar dyes are not properly extracted by amyl alcohol from an alkaline solution. It is also pointed out that some natural colouring matters such as chlorophyll merely form a coating on the wool which may be easily rubbed off, whilst coal-tar colours act as true dyes.

Girard and Dupre's processes (removal of the dye with amyl alcohol either from an alkaline or acid solution and treating the alcoholic extract with wool) give good results. Girard's process for acid magenta (treatment with potassium hydroxide and mercuric acetate and then acidifying the filtrate with sulphuric acid) is useful in the examination of fruit juices and syrups but unsatisfactory in the case of jellies. Cazeneuve's mercuric oxide method, although to be recommended for wines, is not satisfactory for the examination of jellies but may, perhaps, answer for fruit juices and syrups. L. DE K.

Detection of Indican in Pathological Urine. By A. KLETT (*Chem. Zeit.*, 1900, 24, 690).—Ammonium persulphate is much better than bleaching powder as a reagent for indican in urine. A crystal of ammonium persulphate is added to a mixture of urine (10 c.c.) and 25 per cent. hydrochloric acid (5 c.c.), and the mixture shaken with chloroform; the imparting of a blue colour to the latter proves the presence of indican. J. J. S.

Ehrlich's Diazo-reaction. By G. WESENBERG (*Chem. Centr.*, 1900, ii, 67—68; from *Apoth. Zeit.*, 15, 326—328).—The reagent is generally prepared as follows. One gram of sulphanilic acid is dissolved in water containing 50 c.c. of hydrochloric acid and diluted to a litre. When required, 10 c.c. of the solution are mixed with 2 c.c. of a 0.5 per cent. solution of sodium nitrite, and 10 c.c. of the mixture followed by 2.5 c.c. of ammonia are then added to 10 c.c. of the urine to be tested, and the whole is vigorously shaken. If a reaction is obtained and the red liquid exposed to the air for 24 hours, a greenish deposit is obtained, but it often fails to form in cases of tuberculosis.

The author advises that no alterations should be made in the application of the test. It is stated that the diazo-reaction may be caused when naphthalene has been administered; bilirubrin also gives the test, and should be removed by a preliminary treatment with lead acetate or animal charcoal. On the other hand, preparations of tannic acid seem to prevent the reaction. L. DE K.

Ehrlich's Diazo-reaction for the Recognition of some recently introduced Morphine Derivatives. By LUIGI CARCANO (*Chem. Centr.*, 1900, ii, 288; from *Boll. Chim. Farm.*, 39, 425—428).—Ehrlich's reagent in the presence of ammonia (see preceding abstract) acts on heroine (diacetylmorphine), forming a red, crystalline azo-compound of the formula $\text{NH}_4 \cdot \text{SO}_3 \cdot \text{C}_6\text{H}_4 \cdot \text{N}_2 \cdot \text{C}_{21}\text{H}_{22}\text{O}_6\text{N}$. Morphine

gives a similar wine-red but less intense coloration. The reagent is particularly useful for the detection of small quantities of dionine (morphine ethyl ether) in codeine (morphine methyl ether). 0.01 gram of the suspected substance is dissolved in 1 c.c. of water, a few drops of ammonia are added, and then Ehrlich's reagent drop by drop. Pure codeine gives a fine yellow, but dionine a red colour. Narcotine, narceine, papaverine, and thebaine give either a faint yellow colour or no reaction at all.

L. DE K.

Assay of Opium. By J. B. NAGELVOORT (*Pharm. Weekblad*, 1900, No. 24, 1—8).—The acidimetric process introduced by Prescott and Gordin (Abstr., 1899, ii, 714) is recommended. No morphine is removed from the sodium chloride mixture by treatment with benzene, which merely dissolves the inferior opium alkaloids. The results are generally higher than those obtained by the gravimetric process of the U.S.P., but the difference is not always as high as 3 per cent.

A drawback to the method is the long time it takes, also the great waste of alcohol and chloroform, but these might be recovered by distillation.

L. DE K.

Modified Alkalimetric Method for the Valuation of Opium, and other Pharmaceutical Drugs and Preparations that contain Alkaloids. By HARRY M. GORDIN (*Arch. Pharm.*, 1900, 238, 335—341).—The method already described (compare Abstr., 1899, ii, 714, but especially this vol., ii, 110) has been modified slightly. *N*/40 sulphuric acid and *N*/40 potassium hydroxide are used, in place of *N*/20 solutions, in the titration of the alkaloid, which may be extracted in any suitable manner. If it has to be extracted from a solution alkaline with potassium hydroxide, say by shaking with a mixture of ether and chloroform, the extract will contain a little alkali, and must be freed from this before it is evaporated, best by shaking with a little ignited magnesia and filtering. In the case of alkaloids which dissolve with difficulty in very dilute acids, such as strychnine and hydrastine, it is better not to evaporate the ethereal solution, but to shake it with the excess of acid, and then distil off the ether cautiously before titrating.

The method was applied to opium (1 c.c. *N*/40 acid per gram of the sample = 0.71 per cent. of morphine), nux vomica (1 c.c. *N*/40 acid = 0.0091 gram alkaloid, reckoned as equal parts of strychnine and brucine), and cinchona bark (1 c.c. *N*/40 acid = 0.0077 gram alkaloid reckoned as equal parts of quinine and cinchonidine), and also to the commercial extracts of the last two substances and of *Hydrastis canadensis*.

C. F. B.

Action of Iodine on Aconitine and Caffeine. By CARL KIPPENBERGER (*Zeit. anal. Chem.*, 1900, 39, 435—450).—The author has endeavoured to extend to aconitine and caffeine the methods of titration based on the formation of alkaloid periodides (Abstr., 1886, 282, 682; 1899, ii, 534, 584). With caffeine, the presence of a considerable amount of free mineral acid is essential to the precipitation of the periodide; a portion of the caffeine always escapes precipitation, but this may be reduced to inconsiderable traces by using a large excess

of the iodine solution. The amount of iodine consumed varies with the conditions of the titration ; it generally approximates to 4 atoms for one molecule of caffeine, except in the case where the alkaloid hydrochloride is converted into hydriodide by a solution of silver iodide in potassium iodide (Abstr., 1896, ii, 682), when it is very close to 2 atoms. The iodine solution must therefore be standardised against weighed caffeine under conditions identical with those of the titration. Aconitine can be better estimated by alkalimetric titration (this vol., ii, 637) than by means of iodine. M. J. S.

Estimation of Nicotine, Amount of Nicotine in New South Wales Tobaccos. By G. HARKER (*Chem. News*, 1900, 81, 273).—Kissling's and Biel's methods give similar results ; but the modification of the latter involving the weighing of the double sulphates of nicotine and ammonia, and also attempts to estimate nicotine volumetrically in presence of ammonia, have not proved successful. No loss of nicotine has being observed during the evaporation of its ethereal solution. Four varieties of New South Wales tobaccos gave the following percentages of nicotine :—Manilla, 1.95 ; Tamworth, 2.36 ; Tumut, 3.84 ; Bathurst, 4.53. D. A. L.

Estimation of Strychnine. By E. H. FARR and ROBERT WRIGHT (*Pharm. J.*, 1900, [iv], 11, 82—85).—In view of Schweissinger's criticisms (*Pharm. J.*, 1885, [iii], 16, 447), the authors have examined the pharmacopoeial process for the assay of nux vomica preparations (compare Dunstan and Short, Abstr., 1883, 689, 1175). Strychnine ferrocyanide is not quite insoluble in water acidified with sulphuric acid, and if precipitated in presence of brucine, the latter can never be entirely separated. If the amount of brucine is large, this alkaloid may form more than half the precipitate ; almost the whole, however, can be removed by washing with acidified water. The authors recommend that not more than 5 c.c. of the liquid extract or 30 c.c. of the tincture should be assayed, and that 200 c.c. of wash water at a stated temperature (38°) should be employed, a correction being made for the strychnine dissolved by it. R. L. J.

Behaviour of Proteids to Alkaloid Reagents, and a Method of Estimating Combined Hydrochloric Acid. By OTTO COHNHEIM and H. KRIEGER (*Zeit. Biol.*, 1900, 40, 95—116).—The combinations of albumoses and hydrochloric acid which are formed in the stomach are salts which react acid to litmus, phenolphthalein, and other indicators, and neutral to Congo-red, methyl-violet, &c. If a mixture contains only hydrochloric acid and such acid proteoses, the use of such indicators enables the free acid to be estimated ; but this is not the case with the contents of the stomach, where salts and other acids are also present. For the estimation of acid-proteoses, salting-out is a method which was found impracticable, but certain alkaloid reagents precipitate them readily. Sodium phosphotungstate, for instance, will not precipitate proteid, but it will precipitate proteid which is combined with hydrochloric acid. In this, proteids resemble Hantzsch's pseudo-ammonium bases. Various alkaloid reagents were tested with artificial mixtures and stomach contents. The results

with calcium phosphotungstate and potassio-mercuric iodide were satisfactory, and agree well with those obtained by Sjoqvist's more complicated method. W. D. H.

Modification of Ritthausen's Method of Determining Proteids. By F. BARNSTEIN (*Landw. Versuchs-Stat.* 1900, 54, 327—336).—Instead of gradually adding sodium hydroxide until the solution is neutral, it is proposed to add a definite volume of aqueous sodium hydroxide, insufficient to completely precipitate the copper. In this manner, the difficulty of exactly neutralising coloured liquids is avoided, and there is a further advantage that the precipitate settles quickly, whilst the liquid filters more easily than is the case with Stutzer's method. The process is as follows.

The substance is boiled with 50 c.c. of water, or, if starchy, is heated for 10 minutes in a water-bath, treated with 25 c.c. of a solution of copper sulphate (containing 60 grams of the crystallised salt per litre); 25 c.c. of aqueous sodium hydroxide (12.5 : 1000) is then added, the liquid being stirred; the supernatant liquid is poured through a filter, the precipitate washed several times by decantation, and finally on the filter. Washing is continued until the solution no longer shows a reaction with potassium ferrocyanide or barium chloride. The nitrogen is then determined by the Kjeldahl process without removing the precipitate from the filter.

A number of results are given agreeing very nearly with those obtained by Stutzer's method. In the case of tea, sugar-beet, lupins, and tobacco, however, somewhat high results are obtained (+0.07 to 0.19 per cent). The results of special determinations showed that asparagine, guanine, and betaine are not precipitated by copper hydroxide. Probably the malt-germ extract with which the substances were mixed kept the guanine in solution (compare Bosshard and Schulze, *Landw. Versuchs-Stat.*, 1887, 33, 132). Tobacco which had been boiled with 40 per cent. alcohol, acidified with acetic acid (Kellner, *Landw. Versuchs-Stat.*, 24, 439) still gave a rather higher result (+0.09 per cent). than by Stutzer's method. The new modification is, however, suitable for most purposes.

As regards peptones, it was found that both with vegetable and animal albumin the precipitation was not complete, but in the modification adopted by the author the copper precipitate contained more nitrogen than was obtained by Stutzer's method. N. H. J. M.

Precipitation of Proteids. By HENRIK SCHJERNING (*Zeit. anal. Chem.*, 1900, 39, 545—566).—In continuation of earlier work on this subject (Abstr., 1896, ii, 631; 1898, ii, 271, 416, 658), the author inquires how far his proposed reagents, and those suggested by others, fulfil the three conditions (I) of giving clear filtrates and washings, (II) of invariably precipitating certain groups of proteids, (III) of precipitating no other nitrogenous organic substances. The reagents investigated (in addition to his own) are (1) Bromine water (Abstr., 1898, ii, 320), (2) tannic acid, (3) Stutzer's copper reagent prepared by Fassbender's method (Abstr., 1881, 205), (4) phosphotungstic acid. Experiments with about 20 different nitrogenous substances show that none of the proposed reagents conforms completely with condition

III, but that the author's six reagents are by far the safest inasmuch as, with the exception of magnesium sulphate, they precipitate very few of these substances, and then in most cases in but small amount. On the other hand, many of these nitrogenous substances are precipitated, and sometimes in large amounts, by bromine water, Stutzer's reagent, and especially by phosphotungstic acid, whilst in other cases precipitates are produced which pass through filter-paper, but would be retained if formed simultaneously with proteid precipitates. Uranium acetate in presence of phosphates and mercuric chloride precipitates ammonia from the acetate. The errors so produced can be avoided by precipitating the phosphoric acid by lead acetate (not in excess) at 50° before adding uranium acetate, or by heating the precipitate with magnesia; the precipitation of ammonia from its acetate by mercuric chloride is prevented by the presence of alkali chlorides, especially ammonium chloride, or the use of mercuric chloride can be avoided altogether by employing lead acetate, which throws down the same proteids. As regards the actual precipitation of proteids by the reagents mentioned, it is shown that bromine water causes very incomplete precipitation and is very liable to give turbid filtrates, that tannic acid and Stutzer's reagent precipitate albumoses and peptones incompletely or not at all, and that phosphotungstic acid in some cases fails to conform with condition II. Laszczynski's proposal to coagulate the proteids by heating at a pressure of $1\frac{1}{2}$ atmospheres is likewise shown to give very imperfect results. In cases where large amounts of salts of the light metals are present all the reagents fail to give quantitative results, with the exception of magnesium sulphate, stannous chloride, and probably Stutzer's reagent and tannic acid.

INDEX OF SUBJECTS.

ABSTRACTS. 1900. Parts I & II.

(Marked A. i and A. ii respectively); and also to Transactions, 1900 (marked T.); and to Proceedings of the Session 1899—1900; Nos. 213 to 226, Nov., 1899—June, 1900 (marked P.).

A.

- Abienic, α - and β -Abietinolic and Abietolic acids and Abietoresen** (TSCHIRCH and WEIGEL), A., i, 679.
- Abies canadensis*, balsam of** (TSCHIRCH and BRÜNING), A., i, 678.
- Abies pectinata*, balsam of** (TSCHIRCH and WEIGEL), A., i, 679.
- Absorption in the small intestine** (COHN-HEIM), A., ii, 289.
- of carbohydrates, fats, and proteids (MOSSO), A., ii, 605.
- of fat (HOFBAUER), A., ii, 605; (PFLÜGER), A., ii, 667; (FRIEDENTHAL), A., ii, 668.
- of fat in the large intestine (HAMBURGER), A., ii, 418.
- of iodides by the skin (GALLARD), A., ii, 419.
- of iron by the intestine (ABDERHALDEN), A., ii, 223, 289, 416.
- of free oxygen by normal urine (BERTHELOT), A., ii, 740.
- of saline solutions by the small intestine (WALLACE and CUSHNY), A., ii, 31.
- of sugars in the intestine (HEDON), A., ii, 223.
- Acacetin from *Robinia Pseudacacia* and its acetyl derivative** (PERKIN), T., 430; P., 1900, 45.
- Accumulators.** See Electrochemistry.
- Acet-.** See also Aceto-, Acetyl-, and under the Parent Substance.
- Acetal-*m*- and -*p*-cresol and -resorcinol** (FOSSE and ETTLINGER), A., i, 392.
- Acetaldehyde, heat of combustion and of formation of** (BERTHELOT and DELÉPINE), A., ii, 334.
- Acetaldehyde, condensation of, with propaldehyde** (SCHMALZHOFFER), A., i, 626.
- colour reaction of (RIMINI), A., ii, 56, 454; (LEWIN), A., ii, 179.
- detection of, in ether (BLASER), A., ii, 179.
- detection of, in fermentation vinegar (BÖTTINGER), A., ii, 773.
- Acetaldehyde, dibromo-, hydrate of** (WITTORFF), A., i, 421.
- Acetaldoxime, spectrum of** (HARTLEY and DOBBIE), T., 321; P., 1900, 14.
- Acetamide, action of chlorodinitrobenzene on** (KYM), A., i, 158.
- thiocyano- (FRIEDRICH and BECKURTS), A., i, 478.
- Acetanilide, action of dry silver oxide and ethyl iodide on** (LANDER), T., 737; P., 1900, 6, 90.
- Acetanilide, 3:5-dibromo-, 4:2- and 2:4-chlorobromo-, 2:4-bromonitro-, and 2:6:4-dibromonitro-** (CHATTAWAY and ORTON), A., i, 643.
- o*-mono- and 2:4-di-bromo- and -chloro-, formation of (CHATTAWAY and ORTON), T., 798; P., 1900, 112.
- m*-chloro-, action of bleaching powder on a hot acetic acid solution of (CHATTAWAY, ORTON, and HURTLEY), T., 804.
- substituted nitrogen chlorides from, and their transformation (CHATTAWAY, ORTON and HURTLEY), T., 800; P., 1900, 125.
- di*-, *tri*-, and *tetra*-chloro-derivatives of, from substituted nitrogen chlorides (CHATTAWAY, ORTON and HURTLEY), T., 800; P., 1900, 125.

- Acetanilide**, 3-chloro-4-bromo-, 3:4:6-chlorobromonitro-, 3:6-*di*bromo-, 3:4:6-*tri*bromo-, and 4-bromo-3-iodo- (WHEELER and VALENTINE), A., i, 25.
p-nitro-, electrolytic reduction of (SONNEBORN), A., i, 464.
- Acetanilide sodium hydroxide**, thio- (WHEELER), A., i, 493.
- Acetanilide**, *di*nitro- (MELDOLA and WECHSLER), T., 1172; P., 1900, 167.
- Acetic acid**, formation of, during the lactic acid fermentation of milk
 (BARTHEL), A., ii, 742.
 specific heat and heat of vaporisation of (LUGININ), A., ii, 334.
 freezing point of aqueous solutions of (DAHMS; DE COPPET), A., ii, 65.
 compounds of, with manganese (MEYER and BEST), A., ii, 77.
 detection of, in urine (ARNOLD), A., ii, 113.
 estimation of, in vinegar (DURIEU), A., ii, 322.
 estimation of propionic and butyric acids in (MUSPRATT), A., ii, 375.
- Acetic acid**, silver salt, electrolysis of (MULDER), A., ii, 724.
 uranyl salts and its double salts, behaviour of, towards water (ZEHEENTER), A., i, 424.
- Acetic acid**, *p*-aminobenzoylmethyl, *p*-acetylaminobenzoylmethyl, acetyl-amino-*o*-tolylmethyl, and *p*-amino-*m*-dimethylbenzoylmethyl esters (KUNCKELL), A., i, 663.
*di*bromo-*p*-hydroxymesityl ester (AUWERS, TRAUEN, and WELDE), A., i, 167.
 bromomethyl ester (HENRY), A., i, 537.
 ethyl ester, rate of hydrolysis of (GOLDSCHMIDT and MESSERSCHMITT), A., ii, 200.
 influence of sugars on the velocity of hydrolysis of (COHEN), A., ii, 716.
 solubility of, in aqueous salt solutions (EULER), A., ii, 196.
 methyl, ethyl, propyl, and isobutyl esters, rate of hydrolysis of, at various temperatures (PRICE), A., ii, 528.
 methyl ester, rate of hydrolysis of (COJAZZI), A., i, 327; (DE HEMPTINNE), A., ii, 199; (CAJOLA and CAPPELLINI), A., ii, 394.
 action of strong aqueous soda on, in presence of methyl alcohol and acetone (CUNIASSE), A., ii, 175.
 phenyl, *p*-tolyl, and thymyl esters, transformation of, into the corresponding benzoates (BODROUX), A., i, 224.
- Acetic acid**, picryl ester, action of diazomethane on (v. PECHMANN), A., i, 313.
 α -santalyl ester (v. SODEN), A., i, 677.
 trimethylenepicryl and pyrazolinedimethylenepicryl esters (v. PECHMANN), A., i, 313.
- Acetic acid**, amino-. See Glycine.
 bromo- and chloro-, esters, action of hexamethylenetetramine on (LOCQUIN), A., i, 589.
 chloro-, action of, on diphenylthiosemicarbazide (v. WALTHER and STENZ), A., i, 569.
 action of, on thioncarbamates and thioncarbanilates (WHEELER and BARNES), A., i, 565.
 methyl ester, action of, on tertiary bases (CENSI), A., i, 363.
 phenyl ester, reactions of (MOREL), A., i, 157, 158.
mono-, *di*- and *tri*-chloro-, dissociation constants of, dissolved in mixtures of organic solvents and water (MORELLO), A., ii, 395.
 action of chloral on (GABUTTI), A., i, 370.
- ciano**-, ethyl ester, action of, on ketones (GUARESCHI and GRANDE), A., i, 111; (MINOZZI), A., i, 407.
 constitution of the sodium derivative of (THORPE), T., 923; P., 1900, 113.
 action of bromine and carbon disulphide on the sodium derivative of (WENZEL), A., i, 536.
 condensation of the sodium derivative of, with ethyl β -isopropylacrylate, and with ethyl α - and β -methylacrylates (HOWLES, THORPE, and UDALL), T., 943; P., 1900, 115.
 iodo- and bromo-derivatives of (THORPE and YOUNG), T., 936; P., 1900, 115.
 esters of, acyl derivatives of, action of, on benzenediazonium and diphenyltetrazonium chlorides (FAVREL), A., i, 532.
- thiocyano**-, action of phenylhydrazines on (HARRIES and KLAMT), A., i, 413.
 derivatives of (FRERICHS and BECKURTS), A., i, 478.
 esters of, formation and boiling points of (WHEELER and BARNES), A., i, 565.
- Acetic acid bacteria** (HENNEBERG), A., ii, 297.
- Acetic anhydride** and sulphuric acid, action of, on quinones (THIELE and WINTER), A., i, 504.

- Acetic anhydride** and sulphuric acid as oxidising agents (THIELE and WINTER), A., i, 500.
- Acetic peroxides**, *mono-* and *tri-chloro-* (VANINO and UHLEFELDER), A., i, 371.
- Aceto-**. See also under Parent Substance.
- Acetoacetic acid**, detection and estimation of, in pathological urine (ARNOLD), A., ii, 768.
- estimation of, in urine (SABBATANI), A., ii, 32.
- Acetoacetic acid**, ethyl ester, constitution of, and action of dry silver oxide and ethyl iodide, and dry silver oxide and ethyl iodoacetate on (LANDER), T., 788; P., 1900, 6, 90.
- influence of the solvent on the constitution of (WISLICIENUS), A., i, 9.
- affinity and hydrolytic constants of (GOLDSCHMIDT and OSLAN), A., i, 132, 373.
- acetylation of (CLAISEN and HAASE), A., i, 373.
- and substituted acetoacetates, action of, on *p*-aminobenzoic acid, in presence or absence of pyridine (TROEGER), A., i, 226.
- condensation of, with *m*-aminophenols (v. PECHMANN; v. PECHMANN and SCHALL), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- action of phenylcarbimide on (DIECKMANN), A., i, 482.
- condensations of, with sodium ethoxide, and their reversal (DIECKMANN), A., i, 623.
- menthyl ester (COHN; COHN and TAUSS), A., i, 350.
- Acetoacetic acid**, α -chloro-, ethyl ester, interaction of, with thiosulphonates (TROEGER and EWERS), A., i, 494.
- Acetol**. See Acetylcarbinol.
- 1-Acetonaphthalide**, 2:4-dinitro-, action of tin and of iron on (MELDOLA and EYNON), T., 1159; P., 1900, 166.
- Acetone**, formation of (SABBATANI), A., i, 536.
- heat of combustion and of formation of (BERTHELOT and DELÉPINE), A., ii, 334.
- boiling point of mixtures of, with benzene (HAYWOOD), A., ii, 64.
- vapour pressure relations of mixtures of water and (TAYLOR), A., ii, 529.
- equilibrium between phenol, water, and (SCHREINEMAKERS), A., ii, 393.
- chemical dynamics of the condensation of (KOELICHEN), A., ii, 395.
- action of ammonium cyanide on (v. GULEWITSCH), A., i, 476.
- Acetone**, condensation of, with *iso*-butaldehyde (FRANKE and KOHN), A., i, 206.
- action of Caro's reagent on (v. BAEYER and VILLIGER), A., i, 133, 206, 328.
- methylation of (NEF), A., i, 349.
- action of *iso*amyl nitrite and alcoholic hydrogen chloride on (KISSEL), A., i, 621.
- reactions in water and (ROHLAND), A., ii, 468.
- formation of, in the body (WALD-VOGEL), A., ii, 153.
- testing of (CONROY), A., ii, 374.
- detection of (RIMINI), A., ii, 56.
- detection of, in urine and other secretions (OPPENHEIMER), A., ii, 180.
- estimation of, in urine (SABBATANI), A., ii, 32.
- separation of, from acetoacetic and acetonedicarboxylic acids (SABBATANI), A., ii, 32.
- Acetone**, chloro-, action of, Caro's reagent on (v. BAEYER and VILLIGER), A., i, 329.
- action of, on phenyl-*p*-tolylthiocarbamide (v. WALTHER and STENZ), A., i, 569.
- nitro-, and its phenylhydrazone (LUCAS), A., i, 82.
- Acetonechloroform** (*chlortone*), pharmacology of (ALDRICH and HOUGHTON), A., ii, 353.
- Acetonediamyldisulphone**, amino-, and its salts (POSNER and FAHRENHORST), A., i, 17.
- Acetonedicarboxylic acid**, formation of (DENIGES), A., i, 204; (SABBATANI), A., i, 536.
- oxidation of, in presence of ferrous salts (FENTON and JONES), T., 76; P., 1899, 224.
- mercury salts and derivatives of (LEY), A., i, 382.
- compound of, with mercuric sulphate, and detection of (DENIGES), A., i, 89.
- physiological action of, and estimation of, in urine (SABBATANI), A., ii, 32.
- Acetonedicarboxylic acid**, methyl or ethyl ester, condensation of with benzaldehyde (PETRENKO-KRITSCHENKO and ELTCHANINOFF), A., i, 307.
- ethyl ester, action of ethyl ethoxymethylenecetoacetate and ethoxymethylenemalonate on (ERRERA), A., i, 33.
- trimethyl ester, condensation of, to trimethyl orcinoltricarboxylate (DOOTSON), T., 1196; P., 1900, 170.

- Acetonedicarboxylic acid**, cyano-, ethyl ester, ethyl derivative, and salts of (DERÔME), A., i, 426.
- Acetonediphenyldisulphone**, amino-, and its platinumchloride (POSNER and FAHRENHORST), A., i, 18.
- Acetone glycosuria** (RUSCHHAUPT), A., -ii, 675.
- Acetone peroxide** (v. BAEYER and VILLIGER), A., i, 133, 328.
- Acetonitrile**, action of, on anthranilic acid (BOGERT and GOTTHELF), A., i, 412.
- Acetonuria** (LÜTHJE), A., ii, 229.
- Acetonylacetone**, preparation of (KNORR), A., i, 376.
condensation of, with diethyl oxalate (GRAY), A., i, 376.
- 2-Acetonyl- α -naphthaquinone-3-acetic acid**, ethyl ester of (LIEBERMANN), A., i, 311.
- Acetophenone**, specific heat and heat of vaporisation of (LUGININ), A., ii, 334.
conversion of, into triphenylbenzene (DELACRE), A., i, 603.
bromo-, action of, on piperidine, and on pyridine (SCHMIDT and HARTONG VAN ARK), A., i, 686, 687.
dibromo- and α -dichloro- (WITTORFF), A., i, 422.
- Acetophenoneazobilirubin** (PRÖSCHER), A., i, 571.
- Acetophenonesphenylacetylene** (NEF), A., i, 21.
- Aceto- m -toluidide**, chlorination of (REVERDIN and CRÉPIEUX), A., i, 644.
- Acetotoluidides**, o - and p -, substituted nitrogen chlorides and bromides from (CHATTAWAY and ORTON), T., 789; P., 1900, 102.
- Acetoxime**, spectra of (HARTLEY and DOBBIE), T., 321; P., 1900, 14.
oxidation of (SCHMIDT), A., i, 332.
- p -Acetoxy- ψ -cumyl alcohol**, bromide, and iodide, dibromo- (AUWERS, TRAUN, and WELDE), A., i, 165, 168.
dibromo- p - ψ -cumyl ether, dibromo- (AUWERS, TRAUN, and WELDE), A., i, 169.
- 4-Acetoxy-mesityl bromide**, 2:6-dibromo-, ethers from (AUWERS, TRAUN, and WELDE), A., i, 168.
iodide, 2:6-dibromo- (AUWERS, TRAUN, and WELDE), A., i, 166.
- Acetoxymesityl oxide** (*methyl acetoxymesityl ketone*) (PAULY and LIECK), A., i, 275.
- Acetoxynaphthalic anhydride** and derivatives (ANSELM and ZUCKMAYER), A., i, 175.
- 5-Acetoxy-1-phenyltriazole** (RUPE and LABHARDT), A., i, 259.
- Acetyl-**. See also under Parent Substance.
- Acetyl- p -acetaminobenzoic acid**, and chloro- (TROEGER), A., i, 226.
- Acetylacetanilide**, **Acetylaceto- ψ -cumidide**, and **Acetylaceto- m - and - p -toluidides**, and **Acetyl- α -aceto- m -xylylidide chloro-** (KUNCKELL), A., i, 663.
- Acetylacetone**, action of ethyl mercaptan on (LLAGUER), A., i, 504.
new metallic salts of (GACH), A., i, 276.
- Acetylaconitic acid**, ethyl ester (RUHEMANN and STAPLETON), T., 804; P., 1900, 121.
- o -Acetylaminooacetophenone**, action of aqueous soda on (CAMPS), A., i, 115.
- 7-Acetyl-amino-4-anilino- β -naphthaquinone** (KEHRMANN and WOLFF), A., i, 449.
- 4- p -Acetylaminobenzeneazo-1-phenyl-3-methylpyrazolone** (BÜLOW), A., i, 261.
- Acetyl-amino-benzoic** and -**cinnamic acids**, chloro- m - and - p -, methyl esters (EINHORN and OPPENHEIMER), A., i, 493.
- p -Acetylaminobenzoylecarbinol** and its phenylhydrazone (KUNCKELL), A., i, 663.
- Acetyl-amino- m - and - p -hydroxybenzoic acids**, 4- and 3-chloro-, methyl esters (EINHORN and OPPENHEIMER), A., i, 493.
- Acetylaminomethylphenonaphthacridine** ("*acetylaminomethylnaphthacridine*"), methylation of, and its methyl sulphate (ULLMANN and NAERF), A., i, 689.
- 9-Acetylaminonaphthaphenasine** (KEHRMANN and WOLFF), A., i, 450.
- 7-Acetyl-amino- β -naphthaquinone** (KEHRMANN and WOLFF), A., i, 449, 463.
- 7-Acetyl-amino-2-naphthol** and its 1-amino-derivative (KEHRMANN and WOLFF), A., 449.
- α - p -Acetylaminophenylazoacetoacetic acid**, its ethyl ester and amides (BÜLOW), A., i, 261.
- 2-Acetyl-amino-7-phenylnaphthaphenazonium 7-bromide** (KEHRMANN and WOLFF), A., i, 464.
- 2-Acetyl-amino-12-phenylisonaphthaphenazonium salts** (KEHRMANN and WOLFF), A., i, 463.
- Acetylaminosalicylic acid**, 5- and 3-, chloro-, methyl esters (EINHORN and OPPENHEIMER), A., i, 493.
- 1- o - and - p -Acetyl-amino- p - and - o -tolyl-2:5-dimethylpyrrole-3:4-dicarboxylic acid**, ethyl esters (BÜLOW), A., i, 690.

- Acetylaniline**, *p*-chloro- (KUNCKELL), A., i, 663.
- Acetyl-anthranil**, formation of (BREDT and HOF), A., i, 229.
- Acetyl-anthranilic acid** (ERDMANN), A., i, 189.
- chloro-, methyl ester (EINHORN and OPPENHEIMER), A., i, 493.
- Acetylation** in presence of pyridine (MINUNNI), A., i, 214.
- with acetic anhydride in aqueous solution (PINNOW), A., i, 214.
- of primary and secondary amines (MUSSELIUS), A., i, 334.
- Acetylbenzoyl-*t*-diphenylethylenediamine** (JAPP and MOIR), T., 612; P., 1899, 211.
- β*-Acetylisobutyric acid**, mercury salts and derivatives of (LEY), A., i, 382.
- Acetylcarbamide**, cyano- (TRAUBE), A., i, 416.
- Acetylcarbinol** (*acetol*) from propylene glycol (KLING), A., i, 129.
- its condensation product, phenylhydrazone, -osazone, and semicarbazone (PERATONER and LEONARDI), A., i, 551.
- Acetyl-chloro- and -bromo-aminobenzenes** (*phenyl acetyl nitrogen chlorides and bromides*), and their chloro- and bromo-derivatives, transformation of (CHATTAWAY and ORTON), T., 798; P., 1900, 112.
- Acetylchloroamino-mono-, -di-, and -trichlorobenzenes** (*chlorophenyl acetyl nitrogen chlorides*) (CHATTAWAY, ORTON, and HURLEY), T., 800; P., 1900, 125.
- Acetyl-chloro- and -bromo-aminotoluenes**, *o*- and *p*- (*o*- and *p*-*tolyl acetyl nitrogen chlorides and bromides*) and their chloro- and bromo-derivatives (CHATTAWAY and ORTON), T., 790; P., 1900, 102.
- Acetylchloromorphide** (SCHRYVER and LEES), T., 1024; P., 1900, 143.
- 1-Acetylcoumarone** and its bromide, and 4-bromo- and 4-chloro-, and their oximes (STOERMER), A., i, 655.
- Acetyl- ψ -cumidine**, chloro-, and chloro-nitro- (KUNCKELL), A., i, 664.
- γ -Acetyl- β -diethylacetoacetic acid**, ethyl ester (DIECKMANN), A., i, 624.
- 1-Acetyl-4:4-dimethyldihydrodithiazine**, 2:6-dicyano- (HELLSING), A., i, 518.
- Acetyldiphenylamide**, and its sulphonic acid, α -*di-p*-nitro- (GNEHM and WERDENBERG), A., i, 93.
- Acetylene**, generation and purification of, (MATHEWS), A., i, 323.
- purification of (ULLMANN and GOLDBERG), A., i, 1.
- Acetylene**, disadvantage of using sawdust in the purification of (AHRENS), A., i, 1.
- products of the explosion of (MIXTER), A., i, 197.
- and mixtures of acetylene and nitrogen, products of the explosion of (MIXTER), A., i, 618.
- action of anhydrous aluminium chloride on (BAUD), A., i, 369.
- action of copper on (SABATIER and SENDERENS), A., i, 197.
- action of cuprous chloride dissolved in potassium chloride solution on (CHAVASTELON), A., i, 470.
- action of, on copper oxides and on silver oxide (GOOCH and BALDWIN), A., i, 74.
- hydrogenation of, in presence of copper (SABATIER and SENDERENS), A., i, 421.
- action of reduced nickel on (SABATIER and SENDERENS), A., i, 471.
- action of finely divided platinum, cobalt, and iron on (SABATIER and SENDERENS), A., i, 534.
- hydrogenation of, in presence of reduced iron or cobalt, or finely divided platinum (SABATIER and SENDERENS), A., i, 470, 471.
- action of hypochlorous and hypobromous acids on (WITTOEFF), A., i, 421.
- oxidation of (BASCHIERI), A., i, 534.
- action of hydrogen peroxide on (CROSS, BEVAN, and HEIBERG), A., i, 534.
- as a laboratory fuel (LACHMAN), A., ii, 593.
- compounds of, with cuprous and potassium chlorides (CHAVASTELON), A., i, 470.
- detection of, by ammoniacal copper solutions and hydroxylamine (ILOSVAY DE NAGY ILOVA), A., ii, 52.
- Acetylene purifiers**, estimation of chromic acid in (ULLMANN and GOLDBERG), A., i, 1.
- Acetylenedicarboxylic acid**, oxidation of, in presence of ferrous salts (FENTON and JONES), T., 76; P., 1899, 224.
- Acetylenedicarboxylic acid**, ethyl ester, preparation of (RUHMANN and BEDDOW), T., 1121.
- condensation of, with β -ketonic esters and with benzamidine and with guanidine (RUHMANN and STAPLETON), T., 804; P., 1900, 121.
- action of phenols on (RUHMANN and BEDDOW), T., 1119; P., 1900, 165.

- Acetylenedicarboxylic acid**, ethyl ester, condensation of, with phenyl mercaptan (RUHEMANN and STAPLETON), T., 1181; P., 1900, 168.
- Acetylguanidine**, cyano- (TRAUBE), A., i, 416.
- 3-Acetyl-4-hydroxyisocarbostyryl** and its isomeride (GABRIEL and COLMAN), A., i, 689.
- Acetylmalonanilic acid**, ethyl ester, formation of (DIECKMANN), A., i, 482.
- Acetylmethylcyclohexanone** and a ketonic acid from (LESER), A., i, 430.
- Acetylmethylhexoic acid** (LESER), A., i, 430.
- Acetylmethylnaphthindenequinone-carboxylic acid**, ethyl ester (MICHEL), A., i, 670.
- Acetylmethylnitrolic acid**, isomeric compounds, $C_6H_5O_4N_4$, from (STEFFENS), A., i, 74.
- β -Acetylisoo- β -pentene- $\alpha\alpha$ -dicarboxylic acid**, ethyl ester (*ethyl mesityl-oxide-malonate*) (PAULY and LIECK), A., i, 275.
- Acetylphenylthiocarbamide** and its isomeride (HUGERSHOFF), A., i, 156.
- Acetylphenylacetylene** and its diiodide (NEF), A., i, 21.
action of potash on (MOUREU and DELANGE), A., i, 397.
- Acetylphenylglycine- α -carboxylic acid** and its diethyl ester (VORLÄNDER and WEISSBRENNER), A., i, 295.
- Acetylphenylhydrazonedi- p -tolylguanidine** (SCHALL), A., i, 464.
- Acetylphenylthiocarbamide**, and its isomeride (HUGERSHOFF), A., i, 156.
action of phenylhydrazine on, (WHEELER and SANDERS), A., i, 564.
- Acetylphenylurethane** and the action of phenylhydrazine on (WHEELER and SANDERS), A., i, 564.
- β -Acetylpropionic acid**. See Lævulic acid.
- α -Acetylpropionitrile**, and α -chloro- (HENRY), A., i, 538.
- Acetylpropionylsalicylic acid osazone** (AUDEN), P., 1899, 231.
- Acetylpyrrolidone** (TAFEL and STERN), A., i, 557.
- Acetyl tartaric acid**, diethyl ester, rotation of (McCRAE and PATTERSON), T., 1096; P., 1900, 161.
- Acetylthiocarbimide**, reactions of, with imino-ethers (WHEELER and SANDERS), A., i, 563.
- Acetyl- α -, - m -, and - p -toluidine**, chloro- (KUNCKELL), A., i, 663.
- Acetyl- α - and - p -tolylthiocarbamides** and their isomerides (HUGERSHOFF), A., i, 156.
- 5-Acetyl-1:2:3-triazole** and its 4-carboxylic acid, trichloro- (ZINCKE, STOFFEL, and PETERMANN), A., i, 526.
- Acetyl- α - m -xylidine**, chloro- and chloronitro- (KUNCKELL), A., i, 664.
- Acetylxyldinesulphonic acids** (JUNGHANN), A., i, 389.
- Acetylxylononitrile** (MAQUENNE), A., i, 423, 472.
- Achroodextrin III**, preparation and properties of (PRIOR and WIEGMANN), A., i, 541.
- Acid** (m. p. 115°) from benzyl cyanide and ethyl fumarate (HENZE), A., i, 347.
(m. p. 279-280°) from the oxidation of ricinine (EVANS), A., i, 309.
- $C_4H_4O_3$, from β -bromoglutaric acid (SSEMENOFF), A., i, 10.
- $C_4H_4O_3$, from β -hydroxyglutaric acid (FICHTER and KRAFFT), A., i, 8.
- $C_6H_3O_3N_3Cl_2$, from the action of sodium hydroxide on azimino*tetra*-chloroketodihydrobenzene (ZINCKE, STOFFEL, and PETERMANN), A., i, 527.
- $C_7H_{10}O_6$, from the oxidation of isopilocarpine with permanganate (JOWETT), T., 852; P., 1900, 124.
- $C_7H_{12}O_2$, from methylcyclohexanone-oxime and from suberoneisoxime (WALLACH), A., i, 45.
- $C_8H_{10}O_2$, from the action of potassium hydroxide on the methylammonium hydroxide of *cis*-hexahydro- p -diethylbenzylaminecarboxylic acid (EINHORN and PAPASTAVROS), A., i, 228.
- $C_8H_{12}O_4$, and $C_9H_{14}O_3$, from verbenone (KERSCHBAUM), A., i, 353.
- $C_9H_{14}O_3$, from the action of sodium and amyl alcohol on phenylaminoacetic acid (EINHORN and PREIFFER), A., i, 222.
- $C_8H_{14}O_3$, and $C_{10}H_{16}O_4$ (or O_5), from isobutyl nitrite, alcohol, and hydrogen chloride (KISSEL), A., i, 621.
- $C_9H_{12}O_4$, and $C_{11}H_{18}O_4$, from cyclopentanone and ethyl succinate (STOBBE and FISCHER), A., i, 179.
- $C_9H_{14}O_2$ (two), from the hydrolysis of methyl bromodihydro- ψ -lauronolate (LEES and PERKIN), P., 1900, 19.
- $C_9H_{14}O_2$, $C_9H_{16}O_2$, and $C_9H_{10}O_2$, from camphoric anhydride and aluminium chloride (BLANC), A., i, 134.
- $C_9H_{14}O_4$, from the reduction of β -hydroxy- γ -tetramethylglutaric acid (MICHAILENKO and JAVORSKY), A., i, 586.

- Acid**, $C_9H_{14}O_6$, from the oxidation of *iso*-lauronic acid (BLANC), A., i, 329.
- $C_9H_{13}BrO_2$ (two), from the action of hydrogen bromide in glacial acetic acid on ψ -campholactone (LEES and PERKIN), P., 1900, 18.
- $C_9H_{16}O_3$ (two), from the action of alkalis on ψ -campholactone (LEES and PERKIN), P., 1900, 18.
- $C_{10}H_9O_5N$, from permanganate and chloroacetyl-*o*-toluidine (KUNCKELL), A., i, 664.
- $C_{10}H_{10}O_8$, from the oxidation of *iso*-safrole (BOUGAULT), A., i, 495.
- $C_{10}H_{12}O_3$, from the aldehyde $C_{10}H_{12}O_2$, from the oxidation of anethole (BOUGAULT), A., i, 495.
- $C_{10}H_{16}O_4$, from α -dibromocamphor and nitric acid (LAPWORTH and CHAPMAN), T., 310; P., 1900, 4.
- $C_{10}H_{16}O_8$, and $C_{10}H_{14}O_8$, from the oxidation of dihydrocampholenic acid (MAHLA and TIEMANN), A., i, 507.
- $C_{11}H_{12}O_7$, $C_{20}H_{20}O_8$, and $C_{20}H_{20}O_{10}$, from the oxidation of tetramethylhematoxylin (PERKIN and YATES), P., 1900, 108.
- $C_{11}H_{16}O_4$, and $C_{11}H_{18}O_5$, from the action of hydrogen cyanide and hydrochloric acid on camphonic acid (LAPWORTH and CHAPMAN), T., 450; P., 1900, 56.
- $C_{11}H_{20}O_4$, from the oxidation of undecenoic acid (THOMS), A., i, 622.
- $C_{12}H_{12}O_8$, and $C_{12}H_{14}O_9$, from the oxidation of trimethylbrazilin (GILBODY, PERKIN, and YATES), P., 1900, 106.
- $C_{12}H_{14}O_8$, from the oxidation of *iso*-apiole (BOUGAULT), A., i, 495.
- $C_{13}H_{18}O_9$, from methylenebisdihydroresorcinol and caustic alkali (VORLÄNDER and KALKOW), A., i, 99.
- $C_{14}H_{14}O_4$, from the oxidation of *iso*-methyleugenol (BOUGAULT), A., i, 495.
- $C_{14}H_{16}O_8$, and $C_{20}H_{26}O_8$, from oil of savin (FROMM), A., i, 402.
- $C_{15}H_{24}O_8$, and $C_{15}H_{24}O_9$, from the fusion of dihydroxystearic acid with potash (LE SUEUR), P., 1900, 91.
- $C_{21}H_{26}O_{12}$, from ethyl cetipate and hydrogen cyanide (THOMAS-MAMERT and WEIL), A., i, 427.
- $C_{22}H_{26}O_9$, from the hydrogen chloride additive product of benzylidenedibenzyl ketone (GOLDSCHMIEDT and KNÖFFER), A., i, 35.
- $C_{24}H_{22}O_6N_2$, or $C_{24}H_{22}O_5N_3$, from benzoylusnic acid (PATERNO), A., i, 662.
- Acid**, $C_{21}H_{24}O_4$, from the bromo-derivative of 2:5-diphenylethylenetetrahydropyrone-3-carboxylic acid (COEN), A., i, 308.
- Acid amides**, formation and stability of (MEYER and v. LUTZAU), A., i, 643. structure of (MENSCHUTKIN), A., i, 337. determination of the constitution of, cryoscopically (AUWERS and DOHEN), A., ii, 134.
- Acid chloride**, conversion of an, into an anhydride, by the action of haloid acids (VANDEVELDE), A., i, 272.
- Acidimetry** (ASTRUC), A., ii, 572. of organic basic acids (ASTRUC), A., i, 199; ii, 508; (IMBERT and ASTRUC), A., i, 226. of cacodylic acid (IMBERT), A., i, 145. of substituted malonic acids compared with that of corresponding normal dibasic acids (MASSOL), A., i, 200.
- Acids**, thermal value of the acidity of (DE FORCRAND), A., ii, 527, 528. velocity of reaction of, in organic solvents (GEIGER), A., ii, 394. relation of the taste of, to their degree of dissociation (KAHLENBERG), A., ii, 270, 646; (RICHARDS), A., ii, 391. action of, on nitrogen iodide (CHATTAWAY and STEVENS), A., ii, 722. toxic action of, on *Lupinus albus* (TRUE), A., ii, 303; (KAHLENBERG and AUSTIN), A., ii, 747. standardising (SEYDA), A., ii, 44; (THIELE and RICHTER), A., ii, 620. precautions necessary in using phenolphthalein as an indicator in titrating (MAGNIER DE LA SOURCE), A., ii, 620. separation and identification of (AREGG and HERZ), A., ii, 436; (FRESSENIUS), A., ii, 754. from ethyl cyanoacetate, method of separating the *cis*- and *trans*-modifications of (THORPE), T., 934; P., 1900, 114.
- Acids**, acyclic and cyclic, mixed anhydrides of (BÉHAL), A., i, 8.
- Acids**, fatty, determination of the constitution of (CROSSLEY and LE SUEUR), T., 83; P., 1899, 225. determination of the solidifying point of (FREUNDLICH), A., ii, 250. iodation of (ZERNOFF), A., i, 327. dibasic, heat of neutralisation of, compared with that of substituted malonic acids (MASSOL), A., i, 200. containing isopropyl, action of nitric acid on (BREDT and KERSHAW), A., i, 136.

- Acids, fatty**, dibasic, action of phenyl-carbimide and -thiocarbimide on (BÉNECH), A., i, 340.
 oxidation of, by acid potassium permanganate (PERRIX), A., i, 582.
 identification of (AUWERS), A., i, 84.
 saturated, constitution of (KOMPPA), A., i, 201.
 dissociation constants of (WALKER), T., 397.
 substituted (VANDEVELDE), A., i, 272.
 unsaturated, preparation of, by boiling dibasic β -hydroxy-acids with aqueous sodium hydroxide (FICHTER and DREYFUS), A., i, 426.
 free, estimation of, volumetrically (SWOBODA), A., ii, 514.
 halogenated, action of water on (DE BARR), A., i, 76.
 lower, estimation and separation of (SCHÜTZ), A., ii, 250.
 saturated, affinity coefficients of (BILLITZER), A., i, 7.
 unsaturated, from mercaptols and disulphones of ketonic acids (POSNER), A., i, 5.
 action of hypobromous and hypochlorous acids on (MELIKOFF), A., i, 536.
 estimation of, in fish oils (BULL), A., ii, 250, 325.
 volatile, in beer (SPAETH), A., ii, 177.
 origin of, in butter (ZUNTZ and USSOW), A., ii, 669.
 estimation of, in butter by the Leffmann-Beam's glycerol-soda process (SEYDA), A., ii, 772.
- Acids, inorganic**, complex (KEHRMANN and RÜTTIMANN), A., ii, 145.
 weak, hydrolysis of the sodium salts of, in relation to their dissociation constants (WALKER), A., ii, 268.
 very weak, dissociation constants of (WALKER and CORMACK), T., 5; P., 1899, 208.
- Acids, organic**, isolation and separation of (SCHOORL), A., ii, 449.
 electrolysis of the alkali salts of (PETERSEN), A., ii, 522.
 acidimetry of (ASTRUC), A., i, 199; ii, 508; (IMBERT and ASTRUC), A., i, 226.
 oxidation of, in presence of ferrous salts (FENTON and JONES), T., 69; P., 1899, 224.
- Acids of the oxalic acid series**, derivatives and physical properties of (MEERBURG), A., i, 144.
- Acids of the sugar group**, formation of, and their methylene derivatives (CLOWES and TOLLENS), A., i, 205.
- Acids, unsaturated**, coloured, dibasic, transformation of, into colourless stereoisomerides (STOBBER), A., i, 659.
- Acids, weak**, characterisation of (HANTZSCH), A., i, 94.
 change in the strength of, by the addition of salts (ARRHENIUS), A., ii, 201.

 α - and β -Methyladipic acids.
 Methylaminoembelic acid.
 α -Methyl- α ′-isomethylsuccinic acids.
 Methylaniliminocarbaminothiogly-
collic acid.
 Methylanthranilic acid.
 1-Methylbenzoxazole-4-carboxylic acid.
 α -Methyl- α ′-isobutylglutaric acid.
 β -Methyl-*tert*.-butylhydracrylic acid.
 4-Methyl-6-butyl-1:2-phthalic acid.
 α -Methyl- α ′-isobutylpropanetricarb-
oxylic acid.
 $\alpha\alpha$ ′-Methylisobutylsuccinic acids.
 α - and β -Methylbutyric acids.
 2-Methylcamphenepyrrole-3-carb-
oxylic acid.
 2-Methylcamphenepyrroline-3-carb-
oxylic acid.
 Methylcarboxyresoreylacetic acid.
 Methylcyanoacetic acid.
 Methylidilituric acid.
 Methylenemalononic acids.
 Methylenehydrazylacrylic acid.
 Methylenehydrazylacrylic acid.
 6-Methylglauconic acid.
 α - and β -Methylglutaric acids.
 β -Methyl- $\alpha\epsilon$ -heptadienoic acid.
 6-Methylhydroglauconic acid.
 1-Methyl-2-ketohexamethylenecarb-
oxylic acid.
 4-Methyl-2-ketopentamethylenecarb-
oxylic acid.
 Methylmalonic acid (*isosuccinic acid*).
 2-Methyl- α -naphthimidazolesulphonic
acid.
 Methylloxaluric acid.
 1-Methylcyclopentanonecarboxylic
acid.
 α -Methyl-*p*-isopropylcinnamic acid.
 α -Methyl- β -isopropylglutaric acids.
 $\alpha\alpha$ ′-Methylpropylsuccinic acids.
 1-Methyl-1-propyltrimethylenedicarb-
oxylic acid.
 3-Methylpyrazole-1-*p*-benzoic acid.
 2-Methylpyridine-6-carboxylic acid.
 1-Methylpyrrolidine-2-mono- and -2:2-
di-carboxylic acids.
 Methylresorcinolacetic acid.
 Methylsuccinic acid.
 α -Methyltetronic acid.
 Methyluracilcarboxylic acid.
 Methyluric acids.
 γ -Methylvaleric acid (*isohexanoic acid*).
 Methylvioluric acid.
 Mucic acid.
 Naphtha- β -ketopentamethyleneazine-
carboxylic acid.

Acids. See:—

Naphtha- β -ketopentamethyleneazine-
4-sulphonic acid.
 Naphthalene-1:3:5-trisulphonic acid.
 Naphthalic acid (1:8-Naphthalenedi-
carboxylic acid).
 Naphthaquinoneacetoacetic acids.
 Naphthaquinonebenzoylacetic acid.
 α -Naphthaquinonedimalonic acid.
 α -Naphthaquinoneisoinondedicarb-
oxylic acid.
 β -Naphthaquinone-4-malonic acid.
 Naphthaquinoneoxalacetic acid.
 Naphthaquinoneoxalinediacetic acids.
 1:2-Naphthazine-6:6′-disulphonic
acid.
 α -Naphtholcarboxylic acid.
 α -Naphthol-2-carboxy-3-malonic acid.
 α - and β -Naphthoxybutyric acids.
 β -Naphthoxycinnamic acids.
 α - and β -Naphthoxypropionic acids.
 α - and β -Naphthoxyisovaleric acids.
 α -Naphthoyl-*o*-benzoic acid.
 α - and β -Naphthylcarbamic acid.
 Naphthylcamphorformeneaminecarb-
oxylic acids.
 Naphthylhydrazidoxalhydroxamic
acids.
 Naphthylthiosulphonacetoacetic acids.
*iso*Nicotinic acid.
 "Nitroic acids."
 Norpic acid.
 Nucleic acids.
 Nucleothymic acid.
 Octanedicarboxylic acids.
 $\gamma\delta$ -*iso*Octenoic acid.
 Octenoic acid.
 Oleic acid.
 Opianic acid.

Aconite alkaloids (DUNSTAN and READ), T., 45; P., 1899, 206.

Aconitine, action of iodine on (KIPPENBERGER), A., ii, 777.
value of tests for (MECKE), A., ii, 121.

Aconitum Napellus, comparison of the properties of the alkaloids from, with those from Japanese aconite (DUNSTAN and READ), T., 63.

Acraldehyde (*acrolein*), detection of (LEWIN), A., ii, 179.

Acridine derivatives, action of form-aldehyde on (KOENIGS), A., i, 190.

Acridine series, syntheses in the (ULLMANN and NAEF), A., i, 360, 361, 689.

Acroses, α - and β -, from glycollic aldehyde (JACKSON), T., 129; P., 1899, 238.

Acrylic acid, anhydrous (BILLMANN), A., i, 473.

methods for the preparation of (BILLMANN and WÖHLK), A., i, 425.

preparation of, from allyl alcohol (BILLMANN), A., i, 425.

preparation of, from glycerol (WÖHLK), A., i, 425.

Acrylic acid, α -chloro-, and its ethyl ester (MELIKOFF), A., i, 536.

Actinium (DEBIERNE), A., ii, 20, 350.

Address, presidential (THORPE), T., 555; P., 1900, 77.

n-Adipic acid (*butanedicarboxylic acid*), thermochemistry of (MASSOL), A., ii, 260.

Adlumia cirrhosa, protopine from (SCHLOTTERBECK), A., ii, 746.

Adsorption, experiments on (VRIENS), A., ii, 202.

AFFINITY, CHEMICAL:—

Association, molecular, in liquids (BERTHELOT), A., ii, 335, 337.

Chemical affinity (VAUBEL), A., ii, 264, 590.

Affinity coefficients of saturated fatty acids (BILLITZER), A., i, 7.

AFFINITY, CHEMICAL:—

Affinity constants of acids containing a ring of seven carbon atoms (ROTH), A., ii, 590.

of nitrous acid (SCHÜMMANN), A., ii, 264.

Dilution law (BANCROFT), A., ii, 186.

Mass law, the, and physical reactions (LINCOLN), A., ii, 392.

Modulus law (PONSOT), A., ii, 392.

Chemical change, function of the medium in (BRÜHL), A., ii, 11.

Chemical reactions (MICHAEL), A., i, 321.

characteristics of certain (GIBSON), A., ii, 198.

auxiliary (WEGSCHEIDER), A., ii, 199, 532.

kinetics of, with auxiliary reactions (WEGSCHEIDER), A., ii, 199.

influence of magnetism on (DE HEMPTINNE), A., ii, 707.

in water and acetone (ROHLAND), A., ii, 468.

in solution (PONSOT), A., ii, 337.

in heterogeneous systems (WILDERMANN), A., ii, 200.

limited, in homogeneous systems (PONSOT), A., ii, 392.

reversible: lecture experiments (MILLER and KENRICK), A., ii, 534.

between hydrogen chloride and silver (JOUNIAUX), A., ii, 139.

between metals (COLSON), A., ii, 140.

Catalytic actions, theory of (EULER), A., ii, 532.

an addition to the theory of (WEGSCHEIDER), A., ii, 532.

of alkali in oxidation processes (MANCHOT), A., i, 300.

of various substances in oxidation processes (v. GEORGIEVICS and SPRINGER), A., i, 560.

of some metals (SULC), A., ii, 395.

Catalytic agents, influence of, on oxidation (JONISSEN and REICHER), A., ii, 200.

Catalysis of normal salts (EULER), A., ii, 269.

Chemical equilibrium and electromotive force (ROTHMUND), A., ii, 183; (DANNIEL), A., ii, 464.

numerical laws of (BOUDOUARD), A., ii, 199.

of heterogeneous systems, the law of (WILDERMANN), A., ii, 200.

in a system of four gases (PÉLABON), A., ii, 265.

in the partition of an acid between ammonia and cadmium hydroxide (HERZ), A., ii, 532.

AFFINITY, CHEMICAL :—

Chemical equilibrium in the partition of an acid between zinc hydroxide and ammonia (HERZ), A., ii, 337.
 between hydrogen peroxide and "persulphuric acid" (LOWRY and WEST), T., 955; P., 1900, 127.
 between manganous salts and ammonia (HERZ), A., ii, 68.
 in precipitated silver bromide and iodide (THIEL), A., ii, 521.
 of carnallite (VAN'T HOFF and MEYERHOFFER), A., ii, 12.
 between benzenesulphoncamphylamide and sodium hydroxide solution (DUDEN), A., ii, 267.

Decomposition by sodium of organic halogen compounds dissolved in amyl alcohol (LÖWENHERZ), A., ii, 338.

Hydrolysis of salt solutions (LEY), A., ii, 67, 731; (BRUNER), A., ii, 268.

in organic solvents (CAJOLA and CAPPELLINI), A., ii, 394.

of the sodium salts of weak inorganic acids, in relation to their dissociation constants (WALKER), A., ii, 268.

of metallic salts (CARRARA and VESPIGNANT), A., ii, 647.

of chlorine compounds of gold, platinum and tin on standing, and under the influence of light (KOHLEAUSCH), A., ii, 408.

of silicon and titanium tetrachlorides (v. KOWALEWSKY), A., ii, 731.

of stannic chloride solutions (v. KOWALEWSKY), A., ii, 256.

of amylogen and starch (SYNIEWSKI), A., i, 78.

of polysaccharides (ŠULC), A., ii, 395.

of phenol and its *mono*-, *di*-, and *tri*-chloro-, cyano-, and nitro-derivatives (HANTZSCH), A., i, 95.

Partition of ammonia between chloroform and aqueous solutions of metallic salts (DAWSON and McCRAE), T., 1241; P., 1900, 172.

Velocity of acetylation of primary and secondary amines (MUSSELLIUS), A., i, 334; (MENSCHUTKIN), A., i, 341.

Velocity of graded actions (WALKER), A., ii, 198.

Velocity of change of white into grey tin (COHEN and VAN RIJK), A., ii, 83, 212; (COHEN), A., ii, 212.

Velocity of combination of secondary amines and alkyl bromides (MENSCHUTKIN), A., i, 335, 341.

AFFINITY, CHEMICAL :—

Velocity of decomposition of hydrogen peroxide by colloidal platinum (BREDIG and MÜLLER v. BERNECK), A., ii, 214.

Velocity of diasotisation (SCHÜMANN), A., ii, 264.

Velocity of displacement of halogens from halogenated fatty acids (DE BARR), A., i, 76.

Velocity of esterification of phosphoric acid by glycerol (IMBERT and BELUGOU), A., i, 130.

Velocity of formation of esters from benzoic chloride and fatty alcohols (BRUNER and TOLLOCHKO), A., ii, 648.

of bromobenzene (BRUNER), A., ii, 647.

of carbamide from solid ammonium cyanate (WALKER and WOOD), T., 30; P., 1899, 209.

of olefines (BRUSSOFF), A., i, 322.

Velocity of hydrolysis in heterogeneous systems (GOLDSCHMIDT and MESSERSCHMITT), A., ii, 200.

of ethyl acetoacetate (GOLDSCHMIDT and OSLAN), A., i, 132, 373.

of ethyl acetate, effect of sugars on the (COHEN), A., ii, 716.

of methyl acetate (COJAZZI), A., i, 327; (DE HEMPTINNE), A., ii, 199; (CAJOLA and CAPPELLINI), A., ii, 394.

of esters of formic, acetic, and propionic acids at various temperatures, (PRICE), A., ii, 528.

of ethyl dimethylacetoacetate (GOLDSCHMIDT and OSLAN), A., i, 373.

Velocity of inversion of sugar, influence of normal salts on (ARRHENIUS), A., ii, 201.

Velocity of oxidation, influence of catalytic agents on the (JORISSEN and REICHER), A., ii, 200.

Velocity of reaction before complete equilibrium and before transition points (WILDERMANN), A., ii, 200.

influence of the medium on the (BUCHBÖCK), A., ii, 590.

in isomeric benzene derivatives, influence of chemically indifferent solvents on (MENSCHUTKIN), A., i, 341.

of acids in organic solvents (GEIGER), A., ii, 394.

of acetic acid and primary and secondary amines (MUSSELLIUS), A., i, 334; (MENSCHUTKIN), A., i, 341.

AFFINITY, CHEMICAL:—

Velocity of reaction between benzaldehyde and sodium hydroxide (POMERANZ), A., i, 552.

of bromine on phenylsulphon-acetic and -propionic acids (RAMBERG), A., ii, 717.

of hydroxy-methane-, -ethane-, and -pentane-sulphonic acids (COJAZZI), A., i, 327.

Velocity of solidification and viscosity of supercooled liquids (WILSON), A., ii, 712.

Agar, equilibrium between water and (HARDY), A., ii, 396.

Agaricus campestris, composition of (ZEGA), A., ii, 498.

Agaricus phalloides, constituents of (KOBERT), A., ii, 156.

Agglutination, mechanism of (EENST and ROBEY), A., ii, 560.

of blood corpuscles by chemical agents (HÉDON), A., ii, 665.

Agoniatin, identity of, with plumieride (FRANCHIMONT), A., i, 680.

AGRICULTURAL CHEMISTRY—

ANIMALS, DAIRY PRODUCTS, FEEDING EXPERIMENTS:—

Bullocks, metabolism in full-grown, with maintenance and fattening foods (KELLNER and KÖHLER), A., ii, 563, 565, 566.

Calves, milk and artificial foods for fattening (DICKSON and MALPEAUX), A., ii, 566.

Cows, feeding experiments on (RAMM and MINTROP), A., ii, 39; (VIRCHOW), A., ii, 93; (ALBERT), A., ii, 103; (RAMM and MÖLLER), A., ii, 104, 503; (ARENANDER), A., ii, 236; (HILLS), A., ii, 236, 568; (HAGEMANN), A., ii, 502.

See also Butter, Milk, and Feeding experiments.

Dogs, hæmorrhage and transfusion in (DAWSON), A., ii, 291, 417.

results of the extirpation of liver in (SALASKIN and ZALESKI), A., ii, 607.

feeding experiments on (VIRCHOW), A., ii, 93.

Horses, metabolism in (PFEIFFER), A., ii, 554.

amount of iron present in the hæmoglobin of (LAPICQUE and GILARDONI), A., i, 467.

blood molasses as food for (LILIEN-THAL), A., ii, 502.

Pigs, feeding experiments on (VIRCHOW), A., ii, 93.

blood molasses as food for (LILIEN-THAL), A., ii, 532.

AGRICULTURAL CHEMISTRY: ANIMALS:—
Ruminants, metabolism in (HAGEMANN), A., ii, 222.

Sheep, influence of asparagine and ammonia on proteid metabolism in (KELLNER, KÖHLER, BARNSTEIN, ZIELSTORFF, EWERT, and WEDEMEYER), A., ii, 417.

DAIRY PRODUCTS:—

Butter from various countries compared (ESTCOURT), A., ii, 452.

composition of (RICHMOND), A., ii, 696.

Danish, composition of (FABER), A., ii, 696.

origin of volatile fatty acids in (ZUNTZ and USSOW), A., ii, 689.

effect of food on the hardness and composition of (BARTLETT), A., ii, 567.

effect of food on the quality of (HILLS), A., ii, 236, 568.

effect on, of feeding cows with cotton and sesamé cake (THEORPE), A., ii, 237.

effect on, by feeding cows with sesamé cake (WEIGMANN), A., ii, 40; (SCHEIBE; VIETH), A., ii, 236.

chemical action of mould on (HANUŠ and STOKČŮ), A., ii, 772.

rancidity of (BROWNE), A., ii, 115; (HANUŠ), A., ii, 634.

nutritive value of margarine and, compared (BERTARELLI), A., ii, 224.

relative digestibility of margarine and, in the human intestine (LÜHRIG), A., ii, 224, 667.

methods of analysis. See Main Index.

Cheese, detection of margarine in (FASCETTI and GHIGI), A., ii, 377.

"**Manur**," composition of (ZEGA), A., ii, 503.

Cream, composition of (RICHMOND), A., ii, 696.

Milk, composition of (RICHMOND), A., ii, 696.

constancy in the composition of, and detection of its adulteration (TIMPE), A., ii, 251.

relation between the specific gravity, fat, and solids not fat in (LEONARD), A., ii, 376.

effect of fatigue on the quantity and quality of (HILLS), A., ii, 567.

source of the fat of (CASPARI), A., ii, 163.

composition of the fat of (BROWNE), A., ii, 55.

AGRICULTURAL CHEMISTRY: DAIRY PRODUCTS:—

- Milk**, changes in the constants of fat of, under the influence of feeding (RUFFIN), A., ii, 324.
 effect of feeding fat on the quality of (BARTLETT), A., ii, 567, 568; (HILLS), A., ii, 568; (HENRIQUES and HANSEN), A., ii, 668.
 proteids of (STORCH), A., i, 266.
 galactase, the proteolytic ferment of, and its action on the proteids of (BABCOCK and RUSSELL; v. FREUDENREICH), A., i, 712.
 sour (RICHMOND and HARRISON), A., ii, 451.
 effect of different substances on the curdling of (BOKORNY), A., ii, 297.
 value of certain antiseptics in (BABCOCK, RUSSELL, and VIVIAN), A., ii, 560.
 effect of preservatives on (SCHULZE), A., ii, 251.
 boric acid and formaldehyde as preservatives of (RIDEAL and FOULERTON), A., ii, 560; (HEHNER), A., ii, 561.
 methods of analysis. See Main Index.

FEEDING EXPERIMENTS:—

- Asparagine**, nutritive value of (BRUTSKUS), A., ii, 237.
Atriplex semibaccata, composition and food value of (JAFFA), A., ii, 539.
Bassia nut and cake as food for cows (RAMM and MÖLLER), A., ii, 503.
Beans, French and Hungarian (KOSUTÁNY, WINDISCH, v. HÉRICHS-TÓTH, v. SZÉLL, and FALTIN), A., ii, 750.
Beet molasses of different origin (KELLNER, PETERS, ZAHN, and STRIGEL), A., ii, 566.
Blood molasses as food for cows (RAMM and MINTROP), A., ii, 39; (LILIENTHAL), A., ii, 502; (STROHMER), A., ii, 681.
 as food for horses and pigs (LILIENTHAL), A., ii, 502, 682.
Brewery residues as food for cows (RAMM and MÖLLER), A., ii, 104.
Cakes, various, value of, as foodstuffs (v. KNIERIEM), A., ii, 39.
Cane-sugar, maize-gluten, and malt-germ molasses as foods for cows (RAMM), A., ii, 749.
Cotton seed oil, feeding experiments on dogs and pigs with (VIRCHOW), A., ii, 98.
English cake as food for cows (RAMM and MÖLLER), A., ii, 503.

AGRICULTURAL CHEMISTRY: FEEDING EXPERIMENTS:—

- Feeding stuffs**, digestibility of some non-nitrogenous constituents of some (FRAPS), A., ii, 748.
Fodders, composition of (EMMERLING), A., ii, 614.
Gluten- and starch-meal as food for bullocks (KELLNER and KÖHLER), A., ii, 563; (KELLNER, KÖHLER, BARNSTEIN, ZIELSTORFF, LÜHBIG, and MACH), A., ii, 565.
Gluten- and starch-meal and earth nut oils as food for bullocks (KELLNER and KÖHLER), A., ii, 563; (KELLNER, KÖHLER, ZIELSTORFF, HERING, EWERT, and LEHMANN), A., ii, 565.
Grain, mixed, and maize, as food for cows (FRIIS), A., ii, 615.
Maize-germ molasses, as food for cows (SCHULZE), A., ii, 502.
Meadow hay, oat straw, starch meal, and molasses as food for bullocks (KELLNER and KÖHLER), A., ii, 563; (KELLNER, KÖHLER, LEHMANN, HERING, WEDEMEYER, and METHNER), A., ii, 566.
Meadow hay, wheat straw, starch meal, extracted rye straw, and molasses as food for bullocks (KELLNER and KÖHLER), A., ii, 563; (KELLNER, KÖHLER, LEHMANN, HERING, WEDEMEYER, VOLHARD, PETERS, v. GILLERN, and ZAHN), A., ii, 566.
Molasses as food for cows (HOPPE), A., ii, 681.
 non-saccharine matter of, as food for cows (RAMM and MONSEN), A., ii, 750.
Oil cakes, composition of (EMMERLING), A., ii, 614.
Palm kernels, crushed, as food for cows (VIETH), A., ii, 682.
Peat-meal molasses, (WOY), A., ii, 682.
Rape cake, development and injurious effect of mustard oil in (SJOLEMA), A., ii, 613.
Rye as food (v. KNIERIEM), A., ii, 748.
Tropon as food for cows (RAMM and MÖLLER), A., ii, 503.
Vetches as food (v. KNIERIEM), A., ii, 749.

PLANTS.

PLANT COMPOSITION AND METABOLISM:—

- Plants**, formation and decomposition of albumin in (SCHULZE), A., ii, 612.

AGRICULTURAL CHEMISTRY: PLANTS:—

Plants, formation of amino-acids and proteids in (EMMERLING), A., ii, 612.

distribution of cane-sugar in (ANDERSEN), A., ii, 561.

chromium, molybdenum, and vanadium in (DEMARÇAY), A., ii, 235.

copper in (MACDOUGAL), A., ii, 235.

formation of formaldehyde in (POL-LACCI), A., ii, 160, 426.

lithium in (TSCHERMAK), A., ii, 235.

occurrence of myrosin in (BOKORNY), A., ii, 746.

proteids in (BOKORNY), A., ii, 426 ; (EMMERLING), A., ii, 612.

conditions of the production of living proteids in, and their importance in the respiration of (PALLADIN), A., ii, 612.

proteid metabolism in (SCHULZE), A., ii, 745.

amount of sulphur in (BOGDANOFF), A., ii, 160.

genesis of terpenic constituents in (CHARABOT), A., i, 241, 303 ; ii, 101, 361, 362.

relation of the ash to the height of (MILLS, IMRIE, and GRAY), A., ii, 496.

action of dry and moist air on (EBERHARDT), A., ii, 561.

effect of manuring on the inner processes of some (MÜLLER-THURGAU), A., ii, 506.

nutrition of, with organic nitrogenous compounds (LUTZ), A., ii, 233.

absorption of iodine by (BOURCET), A., ii, 100.

absorption of soluble salts by (DEMOUSSEY), A., ii, 161.

utilisation of potash in soil by (SCHLESING), A., ii, 806.

assimilation by, in soils containing different amounts of sand (GROSS), A., ii, 363.

chlorophyllous, phosphorus compound first formed in (POSTERNAK), A., ii, 679.

etiolated, changes produced in (ANDRÉ), A., ii, 423.

medicinal, ashes of some (GRIFFITHS), A., ii, 679.

importance of, used for green-manuring in increasing the amount of nitrogen in the soil (LARSEN), A., ii, 505.

PLANTS:—

Ashes of some medicinal plants (GRIFFITHS), A., ii, 679.

VOL. LXXVIII. ii.

AGRICULTURAL CHEMISTRY: PLANTS:—

Cell, chemistry of the (SOSNOWSKI), A., ii, 100.

production of sucrose from dextrose in the (GROSS), A., ii, 361.

Chlorophyll, chemistry of (MARCHLEWSKI and SCHUNCK), T., 1080 ; P., 1900, 148.

formation of, in the dark (RADAIS), A., ii, 362.

decomposition of, by oxidising enzymes (WOODS), A., ii, 234.

assimilation of, induced by sunlight filtered through leaves (GRIFFON), A., ii, 159.

Chlorophyllous assimilation, influence of pressure on (FRIEDEL), A., ii, 679.

in indoor plants (GRIFFON), A., ii, 426.

Leaves, yellow colouring matters of, and their spectrum (SCHUNCK), A., ii, 36.

Root nodules of alder and Elæagnus (HILTNER), A., ii, 426.

of leguminous plants, nature and functions of (STOKLASA and DAWSON), A., ii, 610.

value of, in lupin cultivation (DEHÉRAIN and DEMOUSSEY), A., ii, 238.

leguminous, action of, in water cultures (NOBBE and HILTNER), A., ii, 234.

Root secretions (CZAPEK), A., ii, 234.

Roots, influence of nitrogen on the growth of (MÜLLER-THURGAU), A., ii, 361.

Seeds, action of anæsthetic vapours on (COUPIN), A., ii, 35.

effect of ferments on the germination of (THOMSON), A., ii, 496.

influence of the temperature of liquid hydrogen on the germinative power of (THISELTON-DYER), A., ii, 300.

changes in the mineral and organic constituents of, during germination (ANDRÉ), A., ii, 159, 300.

digestion of the reserves in, during germination, and their assimilation by the seedlings (MAZÉ), A., ii, 300.

germinating, proteolytic ferments of (HARLAY), A., ii, 744.

occurrence and action of proteolytic ferments in (BUTKEWITSON), A., ii, 744.

Stems, absorption of water and dissolved substances by (BRÉAL), A., ii, 35.

AGRICULTURAL CHEMISTRY: PLANTS:—

Tissues, furfuroids of (CROSS, BEVAN, and REMINGTON), A., ii, 611.

Respiration, importance of "living" proteid in (PALLADIN), A., ii, 613.

Plant growth, importance of Bacteria in (STOKLASA), A., ii, 360.

sugar as an aid to (GOLDING), A., ii, 617.

toxic action of compounds of the alkaline-earth metals towards (COUPIN), A., ii, 363; (SUZUKI), A., ii, 561.

poisonous properties of sodium chloride and sea water towards (COUPIN), A., ii, 236.

Germination (MAQUENNE), A., ii, 678.
action of calcium hydroxide on (WINDISCH), A., ii, 614.

PLANTS:—

Agaricus campestris, composition of (ZEGA), A., ii, 498.

Agaricus phalloides, constituents of (KOBERT), A., ii, 156.

Apios tuberosa, composition of (BRIGHETTI), A., ii, 498.

Apple trees, material for the nutrition of (HOTTER), A., ii, 745.

Astragalus caryocarpus, fruit of (FRANKFORTER), A., ii, 747.

Barley, manurial experiments on (HANAMANN), A., ii, 41, 752; (PRIANISCHNIKOFF), A., ii, 237; (BAESSLER), A., ii, 307.

Barley grain, relation between the weight of, and percentage of nitrogen in the (JOHANNSEN), A., ii, 363.

Beans, effect of alinit and nitragin on (CAMPBELL), A., ii, 433.

Beetroot (sugar), composition of very rich (GRAFTIAU), A., ii, 430.

cultivation of (WILFARTH and WIMMER), A., ii, 365.

experiments with, in 1898 (STONE, CLINTON, KINSELY, and CAVANAUGH), A., ii, 501.

amount of mineral matter and nitrogen in, variously manured and in different soils (SCHNEIDERWIND), A., ii, 364.

assimilation by (WILFARTH), A., ii, 163.

effect of perchlorate in sodium nitrate on the growth of (STOKLASA), A., ii, 305.

seed, does nitrogenous manure injure? (WILFARTH), A., ii, 366.

influence of potash manures on the development of (STOKLASA), A., ii, 163.

physiological importance of furfuroids in (STOKLASA), A., ii, 100.

AGRICULTURAL CHEMISTRY: PLANTS:—

Beetroot (sugar) excrescences, mites in (BUBÁK), A., ii, 501.

Beet leaves, dextrose and levulose in (LINDET), A., ii, 302.

estimation of oxalic acid in (BÜLOW), A., ii, 322.

Cereals, use of alinit in the cultivation of (MALPRAUX), A., ii, 498.

Clover hay, manurial experiments on (CAMPBELL), A., ii, 429.

Coniferous plants, arginine from (SUZUKI), A., ii, 562.

Conifer seeds, decomposition products of proteids of (SCHULZE and WINTERSTEIN), A., ii, 101.

Copper beech, distribution of the ash constituents in sections of the (HORNBERGER), A., ii, 496.

Cork oak (TASSELLI), A., ii, 750.

Crops, basic constituents of (WARRINGTON), A., ii, 569; (DEMOUSSEY), A., ii, 570.

effect of rain and of the nature of the soil on the production of (PAGNOUL), A., ii, 306.

intermediate, accumulation of nitrogen by the cultivation of (MAERCKER), A., ii, 102.

Euonymus alatus, dulcitol in the bark of (HOEHNEL), A., ii, 427.

Euonymus japonicus, "honey" of (MAQUENNE), A., ii, 161.

Fenugreek, composition of (D'ANCONA), A., ii, 364.

Fenugreek seeds, carbohydrates in (BOURQUELOT and HÉRISSEY), A., ii, 301.

enzyme of (BOURQUELOT and HÉRISSEY), A., ii, 233.

Flax, manuring experiments on (OLSCHOWY), A., ii, 500.

Fodder plants, vegetation of (MONVOISIN), A., ii, 303.

Fruit trees, manurial experiments on (STEGELICH), A., ii, 570.

Gramineae, presence of invertase in some plants of the (O'SULLIVAN), T., 691; P., 1900, 61.

Hay, influence of fermentation on the nutritive value of (HOLDEFLEISS), A., ii, 238.

of *Molinia caerulea* and *Carex Goodenowii*, composition of (IMMENDORFF), A., ii, 162.

Norwegian, composition of (WERENSKIÖLD), A., ii, 304.

Hemp, cultivation of (SAMOGGIA), A., ii, 750.

Hollyhock flowers, composition of (ZAY), A., ii, 563.

AGRICULTURAL CHEMISTRY: PLANTS:—

Hops, manuring of (HANAMANN and KOURINSKY), A., ii, 163.
bitter principles of (BARTH), A., ii, 746.

Horse beans, experiments with, in different soils (SEISSEL and GROSS), A., ii, 430.

Indigo plants, occurrence of indican in the chlorophyll grains of (MOLISCH), A., ii, 101.

Kohl-rabi, manurial experiments on (OTTO), A., ii, 753.

Leguminosae, accumulation of asparagine in (BRÉAL), A., ii, 301.
effect of removing the flowers on the assimilation of nitrogen by (SOAVE), A., ii, 496.

Lettuce, manurial experiments on (OTTO), A., ii, 753.

Lotus corniculatus, Italian, composition of (D'ANCONA), A., ii, 161.

Lucerne, cultivation of, at Grignon (DEHÉRAIN), A., ii, 681.
manuring experiments on (MAERCKER), A., ii, 41.

Lupins, manuring experiments on (ULBRICHT), A., ii, 240.
percentage of alkaloids and corn from various (SEMPOLOWSKI), A., ii, 103.

blue and perennial, alkaloids from (CALLSEN), A., i, 186.

blue, cultivation of (DEHÉRAIN and DEMOUSSY), A., ii, 304.

white, cultivation of (DEHÉRAIN and DEMOUSSY), A., ii, 238.

yellow, effect of nitratin and inoculation soil on (ADLER), A., ii, 501.

Lupinus albus, toxic action of acids and of their sodium salts on (TRUE), A., ii, 303; (KAHLENBERG and AUSTIN), A., ii, 747.

Lupinus luteus seedlings, decomposition products of the proteids of (SCHULZE), A., ii, 101.

Maize, manuring experiments on (JENKINS), A., ii, 41; (MAZÉ), A., ii, 499.

as a food in Servia (ZEGA and MAJSTOROVIC), A., ii, 39.

Mangel-wurzel, cultivation of, at Grignon (DEHÉRAIN), A., ii, 680.
experiments with English, German, and French varieties of (WOHLTMANN), A., ii, 501.

changes in the composition of, during storage (MILLER), A., ii, 430.

Mulberry trees, cultivation of (ALFE), A., ii, 617.

AGRICULTURAL CHEMISTRY: PLANTS:—

Oats, cultivation of, at Grignon (DEHÉRAIN), A., ii, 303.

manuring with basic slag and superphosphate (BAESSLER), A., ii, 307.

effect of alinit and nitratin on (CAMPBELL), A., ii, 433.

distribution of the diastatic enzyme in (MAYER), A., ii, 427.

Olives, compressed, changes in, when stored under different conditions (KLEIN), A., ii, 615.

Olive seeds, composition of, before and after germination (SANI), A., ii, 613.

Paranip, cultivation of (GUÉPIN), A., ii, 751.

Pear trees, material for the nutrition of (HOTTER), A., ii, 745.

composition of the branches of, removed by regular thinning (PASSERINI), A., ii, 162.

Peas, manuring experiments on (LUTOSLAWSKI), A., ii, 99.

germination and growth of, in solutions of salts of fatty acids (LÖVINSON), A., ii, 744, 745.

Phenogams, can barium and strontium replace calcium in? (SUZUKI), A., ii, 561.

Phaseolus multiflorus, changes in the mineral constituents of the seed of, during germination (ANDRÉ), A., ii, 159.

Plane-tree leaves, food-stuffs of (TUCKER and TOLLENS), A., ii, 35.

Potato parings, formation of vanillin in (BRÄUTIGAM), A., ii, 427.

Potato plant, distribution of the diastatic enzyme in the (MAYER), A., ii, 427.

Potatoes, cultivation of, at Grignon (DEHÉRAIN), A., ii, 680.

manurial experiments on (GORDON), A., ii, 238; (SJOLLEMA), A., ii, 304, 305.

influence of water and manures on the activity and development of (WILMS), A., ii, 164.

influence of Stassfurt salts on the composition and yield of (SJOLLEMA), A., ii, 305; (PFEIFFER), A., ii, 751.

Rye, chemical alteration of, on becoming mouldy (SCHERPE), A., ii, 429.

Rye straw, weak, composition of (MURRAY), A., ii, 498.

Sainfoin, cultivation of, at Grignon (DEHÉRAIN), A., ii, 681.

Saw palmetto (*Sabal serrulatum*), fruit of (SHERMAN and BRIGGS), A., ii, 102.

AGRICULTURAL CHEMISTRY: PLANTS:—

Spruce fir, relation of ash to the height of a (MILLS, IMRIE, and GRAY), A., ii, 496.

Sugar-cane, experiments on, in Hawaii (MAXWELL), A., ii, 304.

Tobacco plants (BEHRENS), A., ii, 239. manurial experiments on (JENKINS), A., ii, 239.

Tomatoes, use of fertilisers for (JENKINS and BRITTON), A., ii, 365.

Vine, effects of chlorosis in the (CURTEL), A., ii, 428.

oxidising enzyme in the (CORNU), A., ii, 102.

Wheat, cultivation of, at Grignon (DEHÉRAIN), A., ii, 803.

chemical alteration of, on becoming mouldy (SCHERPE), A., ii, 429.

Wheat germ, oil from (FRANKFORDER and HARDING), A., ii, 87.

nucleic acid and proteids of the (OSBORNE and CAMPBELL), A., i, 573.

Flour, gluten constituents of (GUESS), A., ii, 584.

SOILS.

Agricultural land of the Essex coast, injury to, by inundation of sea-water in 1897 (DYMOND and HUGHES), A., ii, 307.

Soil, distribution and importance of fufuroids in (STOKLASA), A., ii, 40.

composition of, under manure heaps, at different depths (EMMERLING and WEHNERT), A., ii, 505.

denitrification and decomposition of animal matters in (ROGÓYSKI), A., ii, 360.

chemically analysed, manuring experiments on (BAESSLER), A., ii, 240.

practical conclusions from the results of (DOERSTLING), A., ii, 752.

testing of, for application of fertilisers (WEBER), A., ii, 165.

methods of ascertaining the lime requirement of (WHEELER, HARTWELL, and SARGENT), A., ii, 432.

effect of nitrogen, gypsum, and lime on (WHEELER, SARGENT, and HARTWELL), A., ii, 104.

behaviour of water-soluble phosphoric acid in (ULLMANN and GRIMM), A., ii, 431.

inoculation of, with nitrugin (FRANK), A., ii, 298; (NOBBE and HILTNER), A., ii, 299.

alluvial, of Lodi, composition of the (FASCETTI and GHIGI), A., ii, 615.

AGRICULTURAL CHEMISTRY: SOILS:—

Soil, arable, effect of carbon disulphide on the fertility of (WOLLNY), A., ii, 504.

amount of phosphoric acid necessary for (PAGNOUL), A., ii, 164.

meadow, action of manures on (MAERCKER), A., ii, 42; (NESSLER), A., ii, 162; (MALDEN), A., ii, 240; (BRIGHTT), A., ii, 303;

(LAWES and GILBERT), A., ii, 499; (ZECCHINI and NUOLI), A., ii, 505.

peat, composition of various kinds of (TACKE and TOLLENS), A., ii, 682.

manuring experiments on (TACKE), A., ii, 42.

action of animal manure on (HELLSTRÖM), A., ii, 616.

vegetation experiments with (IMMENDORFF and TACKE), A., ii, 615.

composition of drainage from manured and unmanured (TACKE, IMMENDORFF, and MINSEN), A., ii, 683.

peat and sandy, impoverishment of, by removing turf and heather (IMMENDORFF), A., ii, 104.

sandy, action of burnt lime and marl on (TACKE, IMMENDORFF, SALFELD, and WOLFF), A., ii, 616.

of the Canton Redon, composition of (LECHARTIER), A., ii, 432, 433.

"alkali," in Montana (TRAPHAGEN and COBLEIGH), A., ii, 40.

Siberian arable, composition of (SEMPOLOWSKI), A., ii, 433.

of the Tokay wine district (v. BITTÓ), A., ii, 751.

methods of analysis. See Main Index.

NITRIFICATION, NITROGEN, and NITROGENOUS COMPOUNDS:—

Nitrification, recent researches on (WABINGTON), P., 1900, 65.

in the soil of forests (MIGULA), A., ii, 744.

of organic nitrogen (OMELIANSKY), A., ii, 97.

Nitrates, action of Bacteria on (GRIMBERT), A., ii, 97; (SEWERIN), A., ii, 232.

Nitrogen in soil, importance of various plants used for manuring in increasing the amount of (LARSEN), A., ii, 505.

atmospheric, assimilation of, by alinit Bacteria (STOKLASA), A., ii, 96.

AGRICULTURAL CHEMISTRY: SOILS:—

Alinit bacillus (KOLKWITZ), A., ii, 233.

Nitric organism from soil (STUTZER and HARTLEB), A., ii, 97.

Nitrifying organism, biology of a (BEYERINCK), A., ii, 425.

Nitrifying organisms, permanent forms of (BEDDIES), A., ii, 34. influence of organic substances on (WINOGRADSKY and OMELIANSKY), A., ii, 96.

magnesia-gypsum as a solid medium for the cultivation of (OMELIANSKY), A., ii, 232.

Denitrification and fermentation (WOLFF), A., ii, 298.

and decomposition of animal matters in soil (ROGÓYSKI), A., ii, 360.

Denitrifying organisms (GRIMBERT), A., ii, 97; (WOLFF), A., ii, 98; (SEWERIN), A., ii, 232.

morphology and biology of (JENSEN), A., ii, 495.

food of (STUTZER and HARTLEB), A., ii, 97, 359; (JENSEN), A., ii, 232;

(STUTZER and JENSEN), A., ii, 494. nutritive value of carbohydrates for (STOKLASA), A., ii, 98.

WATER.

Rain-water collected at Cirencester, amount of chlorine in (KINCH), T., 1271; P., 1900, 183.

MANURES AND MANURING EXPERIMENTS.

Manures, conservation of (SCHNEIDEWIND), A., ii, 105.

distribution of (BERTHAULT), A., ii, 753.

nitrogen value of (JOHNSON, JENKINS, and BRITTON), A., ii, 42.

denitrification and decomposition of (ROGÓYSKI), A., ii, 360.

effect of, on the inner processes of plants (MÜLLER-THURGAU), A., ii, 506.

animal, action of, on peat soil (HELLSTRÖM), A., ii, 616.

artificial, changes in the weight of, when exposed to air (V. WISELL), A., ii, 683.

use of, for forcing house-crops (JENKINS and BRITTON), A., ii, 365; (OTTO), A., ii, 753.

green, composition of, grown on peaty and sandy soils (IMMENDORFF), A., ii, 164.

methods of analysis. See Main Index.

Alinit, behaviour of (KRÜGER and SCHNEIDEWIND), A., ii, 164.

manurial effect of (CAMPBELL; v. FEILITZEN), A., ii, 433; (TACKER), A., ii, 434.

AGRICULTURAL CHEMISTRY: MANURES:—

Alinit, use of, in the cultivation of cereals (MALPEAUX), A., ii, 498.

Ammonium sulphate as a manure (KLÖPPER), A., ii, 616.

Bone-meal, influence of Bacteria on the decomposition of (STOKLASA, DUCHÁČEK, and PITRA), A., ii, 684.

Farmyard manure, methods of experiments on the preservation of (PFEIFFER, MOSZEIK, and LEMMERMANN), A., ii, 753.

composition of the gas confined in (DEHÉRAIN and DUPONT), A., ii, 617.

Fertiliser-nitrogen, availability of (JOHNSON, JENKINS and BRITTON), A., ii, 42, 506.

Guano, bat, from Cagliari, Sardinia (PARIS), A., ii, 106.

fish, experiments with (BAESSLER), A., ii, 308.

Kraal manure, composition of (LEWIS), A., ii, 507.

Lime and magnesia in burnt lime and marls, experiments with (ULBRICHT), A., ii, 240.

Burnt lime, action of, on sandy soil (TACKER, IMMENDORFF, SALFELD, and WOLFF), A., ii, 616.

Manure-soils from Bohemia composition of (KOURINSKY), A., ii, 752.

Marl, action of, on sandy soil (TACKER, IMMENDORFF, SALFELD, and WOLFF), A., ii, 616.

Nitragin, experiments with (FRANK), A., ii, 298; (NOBBE and HILTNER), A., ii, 299; (CAMPBELL), A., ii, 433; (ADLER), A., ii, 501; (DICKSON and MALPEAUX; SCHRIEBAUX), A., ii, 505; (STOKLASA; DAWSON), A., ii, 610.

Phosphates, infection of, and its prevention (BORNTÄGER), A., ii, 684.

experiments with (SCHREIBER; WAGNER), A., ii, 506, 507.

Tricalcium phosphate, solubility of, in natural waters in presence of carbonic acid (SCHLOSSING), A., ii, 541, 618.

Phosphatic manures, value of lime in (BÜTCHER), A., ii, 106.

Phosphoric acid, water-soluble, behaviour of, in soils (ULLMANN and GRIMM), A., ii, 431.

of basic slag and phosphates, solubility of, in peat soils, dependent on the amount of free humic acid in the soil (MINNSEN and TACKER), A., ii, 618.

AGRICULTURAL CHEMISTRY: MANURES:

Phosphoric acid, methods of analysis.

See Main Index.

Phosphorite, manuring experiments with (SEMPOLOWSKI), A., ii, 43.

Potash-lime manure, experiments with (BAESSLER), A., ii, 308.

Poultry manure, importance of (ULRICH), A., ii, 308.

Slag, basic, experiments with (SEMPOLOWSKI), A., ii, 43; (SCHREIBER; WAGNER), A., ii, 506, 507.

methods of analysis. See Main Index.

Sodium nitrate as a manure (KLÖPPER), A., ii, 616.

perchlorate in, injurious effect of, on the growth of sugar-beet (STOKLASA), A., ii, 305.

Sheep dung deposits, composition of (LEWIS), A., ii, 507.

Stable manure, loss of nitrogen in (MAERCKER and SCHNEIDEWIND), A., ii, 105.

storage of (HOLDEFLEISS), A., ii, 571.

Street-dust as manure (CASALI), A., ii, 754.

Superphosphate and basic slag, experiments with (BAESSLER), A., ii, 307.

reversion of soluble phosphoric acid in (SCHUCHT), A., ii, 44.

bone- and mineral-, comparison between (MENOZZI), A., ii, 43.

methods of analysis. See Main Index.

Manuring experiments on the Schultz-Lupitz system (BAESSLER), A., ii, 504.

with green and dead plants and parts of plants (WOOLNY), A., ii, 683.

Air. See Atmospheric air.

Albaspidin (HAUSMANN), A., i, 49.

Albito from Virginia (VIOLA), A., ii, 663.

Albumen of the seed of the American bean (*Gleditschia triacanthos*), composition of the (GORET), A., ii, 562. of St. Ignatius bean and Nux vomica, composition of the (BOURQUELOT and LAURENT), A., ii, 498, 611.

Albumin, formation and decomposition of, in plants (SCHULZE), A., ii, 612. in the cell of the queen bee (SÜSS; KLETT), A., ii, 93.

in ox-serum (HOUGARDY), A., i, 709.

in normal urine (BELLOCQ), A., ii, 556.

Bence-Jones, occurrence of, in urine (MAGNUS-LEVY), A., i, 615.

Albumin, action of heat, dilute acids and alcohol on (PANORMOFF), A., i, 127. formation of bases from (COHN), A., i, 466.

digestion of, by papain (HARLAY), A., i, 419.

detection of, in urine (MANKIEWICZ), A., ii, 459; (JOLLES), A., ii, 516.

error in estimating, in urine (DEROIDE and OUI), A., ii, 123.

Albumin, egg-, preparation of a pure (HOPKINS), A., i, 466.

crystalline, oxidation of, by hydrogen peroxide (SCHULZ), A., i, 266.

effect of desiccation on the coagulability of (FARMER), A., i, 572.

Albumins, egg-, nomenclature of (PANORMOFF), A., i, 126.

Albuminuria, origin of the proteids in (CLOËTTA), A., ii, 155.

Albumin, action of heat, dilute acids, and alcohol on (PANORMOFF), A., i, 571.

Albuminoid. See Proteid.

Albumoses, formation of (BOKORNY), A., i, 126.

amount of nitrogen from (FRIEDMANN), A., i, 265.

influence of, on urinary secretion (THOMPSON), A., ii, 226.

detection of, in urine (V. ALDOE), A., ii, 123.

Alkali-albumose, from the action of alkali on proteid (MAAS), A., i, 709.

Hetero-albumose from fibrin, nutritive value of (BLUM), A., ii, 667.

Proto-albumose from casein, nutritive value of (BLUM), A., ii, 667.

Hetero- and Proto-albumoses, composition of (PICK), A., i, 68.

Alcohol. See Ethyl alcohol.

Alcohol (b. p. 83-84°), from the hydrocarbon from isofenchyl alcohol (BERTRAM and HELLE), A., i, 399.

pentahydric, from methylallylcarbinol, and its acetyl derivatives (MAXIMOVITSCH), A., i, 325.

C₅H₁₀O, from isoprene bromide (MOKIEWSKY), A., i, 509.

Alcoholism, acute, estimation of in blood and tissues in (GREEN), A., ii, 95, 112.

Alcohols, synthesis of (GRIGNARD), A., i, 382.

magnetic behaviour of (HEINRICH), A., ii, 707.

acidity of (DE FORCAND), A., ii, 527.

reaction of, with alkyl nitrites, in presence of excess of alcoholic hydrogen chloride (KISSEL), A., i, 520.

Alcohols, action of aluminium amalgam on (TISTSCHENKO), A., i, 269.
determination of the toxicity of (VANDEVELDE), A., ii, 302.
detection of aldehydes in (ISTRATI), A., ii, 117.
detection of methyl alcohol in (WOLFF), A., ii, 111.
estimation of, in brandy (ADAM), A., ii, 53.

- Amarine**, racemic and optically active forms of (SNAPE), T., 778; P., 1899, 228; 1900, 118.
- Ambrite**, from New Zealand coal (BEDSON), A., ii, 20.
- Amethyst**, colour of (NABL), A., ii, 661.
- Amides**, action of dry silver oxide and alkyl iodides on (LANDER), T., 736; P., 1900, 6, 90.
 formation of the sodium salts of (WHEELER), A., i, 492.
- Amidines**, action of, on mesityl oxide and phorone (TRAUBE and LORENZ), A., i, 116.
- Amidosulphite**, formation and decomposition of (DIVERS and OGAWA), T., 327; P., 1900, 38.
- Amidosulphuric acid**, production of (DIVERS and HAGA), T., 978; P., 1900, 147.

Amine nitrates, dehydration of, to nitramines (*diazotic acids*) (BAMBERGER and HOFF), A., i, 435.

Amines in aqueous solutions, molecular dissociation of (HANTZSCH and SEBALDT), A., ii, 69.

alkalimetry of the (ASTRUO), A., i, 141.

oxidation of, by Caro's reagent (BAMBERGER and HILL), A., i, 281; (BAMBERGER), A., i, 500.

action of, on acylthioncarbamate esters (WHEELER and JOHNSON), A., i, 632.

action of, on hydroxamic acids (THIELE and PICKARD), A., i, 29.

condensation of, with salol (COHN), A., i, 548.

bromo-, action of silver oxide and of hydroxylamine on (KIJNER), A., i, 277, 338, 629.

Amines, aromatic, direct introduction of nitro-groups into the side chain of (BAMBERGER and HOFF), A., i, 435.

action of cyanogen on (MEVES), A., i, 483.

action of phosphoryl chloride, and of phosphorus thiochloride on, in presence of alkali (AUTENRIETH and RUDOLPH), A., i, 570.

action of picryl chloride on (WEDEKIND), A., i, 216.

primary aromatic, action of hypochlorous acid on (MEIGEN and NORMANN), A., i, 702.

action of nitrous acid on (TÄUBER and WALDER), A., i, 566.

tertiary aromatic (HÄUSSERMANN), A., i, 365.

aromatic and fatty, compounds of, with tellurium tetrabromide and tetrachloride (LENHER), A., i, 379.

fatty, action of Caro's reagent on (BAMBERGER and HILL), A., i, 281.

action of hydrogen peroxide on (MAMLOCK and WOLFFENSTEIN), A., i, 209.

action of sulphur dioxide on (SCHUMANN), A., ii, 272.

detection of (RIMINI), A., ii, 56, 454.

primary and secondary, acetylation of (MUSSELIUS), A., i, 334; (MENSCHUTKIN), A., i, 335, 341.

secondary, new synthesis of (TINGLE), A., i, 641.

velocity of combination of alkyl bromides with (MENSCHUTKIN), A., i, 335, 341.

condensation of, with aldehydes and dithio-oxamide (WALLACH), A., i, 210.

Amines, tertiary, action of cyanogen bromide on (v. BRAUN), A., i, 430, 541, 687.

action of hypochlorous acid on (WILLTÄTTER and IGLAUER), A., i, 458.

primary, secondary and tertiary, distinguishing (SOLONINA), A., i, 147; (MARCKWALD), A., i, 149, 336; (DUDEN), A., i, 282; (MENSCHUTKIN), A., i, 335.

action of, on dibromotriacetoneamine (PAULY and BOEHM), A., i, 357.

compounds of, with iminothiodiphenylimine (SCHAPOSCHNIKOFF), A., i, 523.

 bromiodobromide (JACKSON and DEBBY), A., ii, 596.
 chloride, temperature of maximum density of solutions of (DE COPPET), A., ii, 529.
 action of, on minerals (CLARKE and STEIGER), A., ii, 24, 219, 414.
 action of, on strontium chromate (DUMESNIL), A., ii, 625.
 perchlorate, use of, in the manufacture of new explosives (ALVISI), A., ii, 205.
 fluoride, compound of, with silver fluoride (GRÜTZNER), A., ii, 541.
 fluorohyperborate (MELIKOFF and LORDKIPANIDZE), A., ii, 139.
 telluriodate (WEINLAND and PRAUSE), A., ii, 399.
 mercuriodide, dissociation of (FRANÇOIS), A., ii, 142.
 permanganate (CHRISTENSEN), A., ii, 596.
 permanganomolybdates and salts with potassium (FRIEDHEIM and SAMELSON), A., ii, 547.
 vanadiomolybdates and silicovanadiomolybdates (FRIEDHEIM and CASTENDYCKE), A., ii, 483.
 nitrate, change of the transition point of, through the addition of potassium nitrate (MÜLLER), A., ii, 188.
Ammonium phosphates (v. KNOERRE), A., ii, 652.
 of beryllium, cadmium, and zinc, estimation of the metals in (AUSTIN), A., ii, 49.
 earthy phosphates, attempts to prepare (BARTHE), A., ii, 480.
 magnesium phosphate, composition of, (NEUBAUER; GOOCH and AUSTIN), A., ii, 108.
 sulphate as a manure (KLÖPPER), A., ii, 616.
 chromous sulphate (LAURENT), A., ii, 547.
 hydroximidosulphate, production of (DIVERS and HAGA), T., 689; P., 1900, 71.
 thiosulphate, preparation of, and action of heat on (DIVERS and OGAWA), T., 335; P., 1900, 89.
 double salt with silver and with copper haloids, thiosulphates, and sulphites (ROSENHEIM and STEINHÄUSER), A., ii, 652, 653.
 sulphite, double, with silver and copper (ROSENHEIM and STEINHÄUSER), A., ii, 652.
 amidosulphite, formation and decomposition of (DIVERS and OGAWA), T., 237; P., 1900, 38.
 imidosulphite (DIVERS and OGAWA), P., 1900, 113.
 palladous trichlorosulphite (ROSENHEIM and ITZIG), A., ii, 282.
 sulphites, preparation of, and action of heat on (DIVERS and OGAWA), T., 335; P., 1900, 39.
 thioantimonite and double salt with silver (POUGET), A., ii, 84.
 dithiocarbonate as a substitute for hydrogen and ammonium sulphides (VOGTHERR), A., ii, 241.
 trithionate, preparation of, and action of heat on (DIVERS and OGAWA), T., 335; P., 1900, 39.
Ammonium organic compounds:—
Ammonium compounds, quaternary, formation of (FISCHER and WINDAUS), A., i, 224, 484.
 salts, organic stereoisomeric, characteristics of (WEDEKIND), A., i, 155.
 alcoholates (DECKER), A., i, 522.
 cyanate, solid, preparation and properties of (WALKER and WOOD), T., 21; P., 1899, 209.
 cyanates, substituted, transformation of (WALKER and WOOD), T., 33; P., 1899, 209.
 cyanide, action of, on acetone (v. GULEWITSCH), A., i, 476.
 platosemi-ethylene and -amine chlorides (JÖRGENSEN), A., i, 542.

Amygdalinamidoxime (SCHIFF), A., i, 49.
n-**Amyl alcohol**, solubility coefficients of water and (AIGNAN and DUGAS), A., ii, 68.
Amyl chloride, action of, on calcium carbide (LEFEBVRE), A., i, 323.
 nitrite, action of, on vision (FILEHNE), A., ii, 424.
 sulphide-mercuric iodide (SMILES), T., 164; P., 1899, 240.
*iso***Amyl nitrite**, action of acetone, of methyl propyl ketone, of ethyl alcohol, and of *isocamyl* alcohol on, in presence of alcoholic hydrogen chloride (KISSEL), A., i, 620.
Amylase, preparation of (YVON), A., i, 196.
 action of, on starch (POTTEVIN), A., i, 80.
*iso***Amylcitraconic acid** (LAWRENCE), P., 1900, 156.
Amylene (*γ*-methyl-*β*-butylene) nitrosate (IPATIEFF), A., i, 3.
β-**Amylene nitrosate** (IPATIEFF), A., i, 3.
Amylogen and its hydrolysis (SYNIEWSKI), A., i, 78.
*iso***Amyloxyacetone** (KISSEL), A., i, 621.
*iso***Amylsuccinic acid**, melting point of (LAWRENCE), P., 1900, 156.
Amylxanthic acid, sodium salt of, use of, in qualitative analysis (GRASSINI), A., ii, 510.
Amyrol (v. SODEN), A., i, 401.
Anæmia, pernicious, metabolism in (v. MORACZEWSKI), A., ii, 295.
 condition of the blood in (SMITH), A., ii, 416.
Anæsthetics, action of (MEYER; BAUM), A., ii, 156.
Anagyrine and its compounds and physiological action (SCHMIDT; LITTERSCHEID), A., i, 513; (KLOSTERMANN), A., i, 516.
Analcite from Nova Scotia (CLARKE and STEIGER), A., ii, 25.
 action of ammonium chloride on (CLARKE and STEIGER), A., ii, 25, 219.
Analysis, application of the fractional precipitation of neutral salts to (FINDLAY), A., ii, 716.
 solubility of precipitates in (IMMERWAHR), A., ii, 642.
 use of iodic acid in (JØRGENSEN), A., ii, 620.
 elementary organic, absorption apparatus for (BENEDICT), A., ii, 439.
 qualitative, of the ammonium sulphide group (JEAN), A., ii, 619.
 use of ammonium dithiocarbonate in (VOGTHER), A., ii, 241.

- action of hypobromous acid on (CHATTAWAY, ORTON, and HURTLEY), A., i, 152.
- action of hypochlorous and hypobromous acids on (CHATTAWAY and ORTON), T., 134, 789, 797; P., 1899, 232; P., 1900, 102, 112; (CHATTAWAY, ORTON, and HURTLEY), T., 800; P., 1900, 125; (ARMSTRONG), T., 1047; P., 1900, 160.
- substituted (CHATTAWAY, ORTON, and HURTLEY), A., i, 151; (CHATTAWAY and ORTON), A., i, 152, 643.
- substitution in (ARMSTRONG), T., 1047; P., 1900, 160.
- Aniliminocarbaminothioglycollic acid** (HARRIES and KLAMT), A., i, 418.
- Aniline** and its hydrochloride, electrolysis of fused mixtures of (SZARVASY), T., 208; P., 1899, 194.
- solubility coefficients of water and (AIGNAN and DUGAS), A., ii, 68.
- action of, on α -benzoylaminocinnamic anhydride (ERLENMEYER), A., i, 550.
- reactions of, with hydroxy- and unsaturated compounds (TINGLE), A., i, 544.
- oxidation of (BAMBERGER and TSCHIRNER), A., i, 435.
- meta-sulphonation of (ARMSTRONG and BERRY), P., 1900, 159.
- antimonio-chloride and -iodides (HIGBER), A., i, 285.
- hydrochloride, double salt of, with bismuth chloride (HAUSER and VANINO), A., i, 641.
- Aniline**, hydrochloride, action of, on phosphoryl chloride (ODDO), A., i, 92.
- stannobromide (RICHARDSON and ADAMS), A., i, 151.
- tellurium bromides and chlorides (LENHER), A., i, 379.
- Aniline**, 3:4-*di*-, 2:3:4- and 3:4:6-*tri*-, and 2:3:4:6-*tetra*-bromo- (WHEELER and VALENTINE), A., i, 26.
- pentabromo*-, diazo-salts of (HANTZSCH and SMYTHE), A., i, 316.
- 4-*mono*-, 4:6-*di*-, and 2:4:6-*tri*-bromo-3-iodo- (WHEELER and VALENTINE), A., i, 26.
- 3-chloro-4-*mono*-, 4:6-*di*-, and 2:4:6-*tri*-bromo-, 4-chloro-3-bromo-, 3:4:6-chlorobromonitro-, and 3-chloro-4-bromo-2:6-dinitro- (WHEELER and VALENTINE), A., i, 25, 26.
- 4:2-, and 2:4-chlorobromo- (CHATTAWAY and ORTON), A., i, 643.
- "cyano-" and its acetyl and anhydrobenzoyl derivatives (MEVES), A., i, 483.
- o-nitro-, action of formaldehyde on (MEYER and ROHMER), A., i, 222.
- methylated, nitrosoamines of (BAMBERGER and MÜLLER), A., i, 217.
- Anilineazobenzoylacetone**, *i*-*p*-nitro-. See Benzeneazobenzoylacetone, *p*-nitro-.
- Anilinoacetic acid**, action of sodium and amyl alcohol on (EINHORN and PFEIFFER), A., i, 221.
- ethyl ester, action of sodium ethoxide on (VORLÄNDER and DE MOUILPIED), A., i, 644.
- Anilino-diphenylbenzoquinone** (BORSCHKE), A., i, 594.
- Anilino-diphenylguanidine**, action of carbonyl chloride on (SCHALL), A., i, 464.
- 7-Anilino-3:4-diphenyltriazole** (BUSCH and BAUER), A., i, 415.
- Anilinoembellic acid** (HEFFTER and FEUERSTEIN), A., i, 498.
- 3-Anilino-*flavinduline* chloride**, 2-amino- (KEHRMANN and STOFFEL), A., i, 225.
- 3-Anilino-1-indone** (SCHLOSSBERG), A., i, 665.
- Anilinoinduline**, B., 4, electrolytic preparation of (SZARVASY), T., 207; P., 1899, 194.
- Anilinomalonic acid**, ethyl ester, action of nitrous acid on (CURTISS), A., i, 482.
- Anilinomauveine** (*anilinophenylphenosafranine*) (FISCHER and HEPP), A., i, 462.

- Anilino-4-methylpyrimidines**, 2- and 6-, and their amino-derivatives (GABRIEL and COLSON), A., i, 54.
- Anilinophenosafranine** (FISCHER and HEPP), A., i, 463.
- Anilinophenylglycine-*o*-carboxylic acid**, and esters (VORLÄNDER and WEISSBRENNER), A., i, 295.
- 9-Anilino-7-phenylnaphthaphenazonium 7-chloride**, 10-amino- (KEHRMANN and VALENCIEN), A., i, 255.
- Anilinophenylphenosafranine** (FISCHER and HEPP), A., i, 463.
- 5-Anilino-4-phenyltriazole** and its acetyl and 3-methyl derivatives (BUSCH and BAUER), A., i, 414.
- Animal fluids**, estimation of the reducing power of (ROSIN), A., ii, 319.
- juices and tissues, chemico-physical relations of (OKER-BLOM), A., ii, 290, 356, 607.
- matter, detection of nitric acid in (VITALI), A., ii, 46.
- Animals**, marine, death temperature of (VERNON), A., ii, 93.
- Anime**, East and West Indian, examination of (DIETERICH), A., ii, 118.
- Anisaldehyde** (*o*-methoxybenzaldehyde), preparation of (LABBÉ), A., i, 177.
- p*-Anisaldoximes** (CARVETH), A., i, 34.
- Anisidine**, chloro-*o*-, *m*- and *p*-, and their acetyl derivatives (REVERDIN and ECKHARD), A., i, 28.
- dinitro-, diazotisation of (MELDOLA and WECHSLER), T., 1172; P., 1900, 167.
- "**Anisidines**, cyano-*o*-, and *p*-," and their guanidine derivatives (MEVES), A., i, 483.
- Anisoin**, preparation of (ORNDORFF and MORTON), A., i, 289.
- Anisole**, diamino-, dihydrochloride (HERZIG and AIGNER), A., i, 545.
- o*-, *m*-, and *p*-chloro-, and their nitro-derivatives (REVERDIN and ECKHARD), A., i, 28.
- Anisole-diazoeyanides**, and -diazonium cyanide (HANTZSCH), A., i, 567.
- Anisolesyndiasotato**, potassium (HANTZSCH), A., i, 567.
- Anisole-diazoaloids** (HANTZSCH), A., i, 568.
- αβ*-Anisoylanisylcarbamide** (VAN DAM), A., i, 172.
- Anisylanthranillic acid** (PSCHORR and WOLFES), A., i, 170.
- Ankerite** from Missouri (ROGERS), A., ii, 550.
- Anatto**, colouring matter of (ZWICK), A., i, 513.
- Annual General Meeting**, T., 556; P., 1900, 77.
- Anorthoclase** from Portland, Maine (LORD), A., ii, 603.
- Anthracene**, refraction of (CHILESOTTI), A., i, 339.
- Anthracite** and anthraxolite from Canada (ELLIS and LAWSON), A., ii, 660.
- estimation of volatile combustible matter in (MEADE and ATTIX), A., ii, 168.
- Anthragallool** (1:2:3-*trihydroxyanthraquinone*), its acyl and halogen derivatives (SLAMA), A., i, 181.
- Anthraglucoosennia** (TSCHIRCH and HIEPE), A., i, 682.
- Anthranillic acid** (*o*-aminobenzoic acid), from *o*-nitrotoluene (PREUSS and BINZ), A., i, 392.
- action of acetonitrile on (BOGERT and GOTTHELF), A., i, 412.
- action of chloroform and potash on (ELLIOTT), T., 213; P., 1899, 243.
- ethyl ester, formation of indigotin from (VORLÄNDER and KOETTNITZ), A., i, 649.
- glyciny derivatives of the esters of (EINHORN and OPPENHEIMER), A., i, 493.
- Anthranilic acid**, 3:6-dichloro- (GRAEBE and GOUREVITZ), A., i, 547.
- Anthranilphenylacetic acid** (HENZE), A., i, 119.
- 9-Anthranol-2-carboxylic acid** and dinitro- (LIMPRICHT and LACH), A., i, 31.
- Anthraphenones** (PERRIER), A., i, 350.
- Anthraquinone-2-carboxylic acid** and dinitro- (LIMPRICHT and LACH), A., i, 31.
- Antifebrin**, test for, in antipyrine (RAIKOW and SCHTARBANOW), A., ii, 456.
- Antimony**, alleged transformation of phosphorus into (WINKLER), A., ii, 476; (FITTICA), A., ii, 651.
- Antimony alloys** with tin (REINDERS), A., ii, 731.
- Antimony compounds** with sulphur (FAKTOR), A., ii, 598.
- Antimony trichloride** in cryoscopy (TOLLOZKO), A., ii, 190.
- pentachloride*, compound of, with nitrosyl chloride (VAN HETEREN), A., ii, 187.
- Antimonous oxide** action of, on sulphur chloride (ODDO and SERRA), A., ii, 74.
- Tri- and tetra-antimonie acids** and their salts (DEACROIX), A., ii, 145.
- Antimony sulphide**, action of hydrogen on (PÉLABON), A., ii, 352.
- Antimony, organic compounds** (PARTHEIL and MANNHEIM), A., i, 479.

- Antimony**, double halogen salts of, with aniline and the toluidines (HIGBER), A., i, 285.
- Antimony**, estimation and separation of:—
 estimation of, electrolytically (OST and KLAPPROTH), A., ii, 692.
 estimation of, in ores (BROWN), A., ii, 51.
 estimation and separation of arsenic and, in ores (BECK and FISHER), A., ii, 312.
 separation of arsenic and tin from (MARBURG), A., ii, 248.
- Antipeptone** (KUTSCHER), A., i, 72.
- Antipyrine** (1-phenyldimethylpyrazolone), compounds of, with copper chloride, and with metallic benzoates and salicylates (SCHUYTEN), A., i, 57.
 compounds of, with mercury halogen salts (VILLER and ASTRE), A., i, 362, 411.
 action of iodine on (BOUGAULT), A., i, 311, 312.
 excretion of (LAWROFF), A., ii, 741.
 and amino-, reactions of (HOFFMANN), A., ii, 379.
 tests for antifebrin, exalgin and phenacetin in (RAIKOW and SCHARBANO), A., ii, 456.
- Antipyrine**, bromo- (MICHAELIS and SCHWABE), A., i, 695.
 iodo- (BOUGAULT), A., i, 312.
 compounds of, with mercury salts (BOUGAULT), A., i, 312, 361.
- Antipyrine benzoates**. See Benzopyrines.
- Antipyrine-1-p-benzoic acid** (antipyrine-Bz-p-carboxylic acid), (MICHAELIS and SUDENDORF), A., i, 696.
- Antipyrine salicylates**. See Salipyrrines.
- Apigenin** (1-3-4'-trihydroxyflavone), synthesis of, and its triacetyl derivative (CZAJKOWSKI, v. KOSTANECKI, and TAMBOR), A., i, 504.
- Apigenin** and **Apilin**, action of nitric acid on (PERKIN), T., 416; P., 1900, 44.
- Apigetrin**, and nitro- (PERKIN), T., 420; P., 1900, 45.
- isoApiole**, acid, $C_{15}H_{14}O_6$, from the oxidation of (BOUGAULT), A., i, 495.
- Apios tuberosa**, composition of (BRIGHETTI), A., ii, 498.
- Aplysia**, digestion of carbohydrates by (RÜHMANN), A., ii, 289.
- Apple chips**, estimation of zinc in (LEHMANN), A., ii, 170.
 trees. See Agricultural Chemistry.
- Arabic acid** from beetroot (VOTOČEK and SEBOR), A., i, 208.
- Arabinose** from tragacanth (WIDTSON and TOLLENS), A., i, 207.
- Arabinose**, fermentation of (SALKOWSKI), A., i, 628.
- α -Arabinose**, phenylbenzylhydrazone of (RUFF and OLLENDORFF), A., i, 77.
- l-Arabinose**, amylicercapal and diphenylhydrazones of (NEUBERG), A., i, 539.
 phenylosazones of (NEUBERG), A., i, 189.
 conversion of, into l-erythrose (WOHL), A., i, 140.
- r-Arabinose** in urine, and phenylhydrazones, osazones, and amylicercapal of (NEUBERG), A., i, 539.
- Aragonite** and calcite, physicochemical relations of (FOOTE), A., ii, 541.
- Aralia nudicaulis**, araliene and oil from (ALPERS), A., i, 107.
- Araroba powder** (HMSER), A., i, 41.
- Arctostaphylos Uva-ursi**, constituents of (PERKIN), T., 424; P., 1900, 45.
- Arenicols**, the pigment of the (FAUVEL), A., ii, 227.
- Arginine** from coniferous plants (SUZUKI), A., ii, 562.
 from the proteid of conifer seeds (SCHULZE and WINTERSTEIN), A., ii, 101.
 from malt, formation of (PETIT and LABOURASSE), A., ii, 612.
 constitution of (SCHULZE and WINTERSTEIN), A., i, 110.
 identity of animal and vegetable (SCHULZE), A., i, 515.
 action of, on the tryptic digestion of proteid (LAWROFF), A., ii, 28.
- Argon**, new lines in the spectrum of (NASINI, ANDERLINI, and SALVADORI), A., ii, 181.
 relative rates of effusion of, and of other gases (DONNAN), A., ii, 390.
 solubility of, in water (ESTREICHER), A., ii, 205.
 passage of, through thin films of indiarubber (RAYLEIGH), A., ii, 342.
 viscosity of, as affected by temperature (RAYLEIGH), A., ii, 590.
- Aromatic compounds**, colour reaction for certain (BURGESS), A., ii, 774.
 series, isomerism in the (OCHSNER DE CONINCK), A., i, 592.
- Arsenic**, supposed transformation of phosphorus into (WINKLER), A., ii, 476; (FITTICA), A., ii, 651; (NÖLTING and FEUERSTEIN), A., ii, 722.
 action of potassammonium on (HUGOT), A., ii, 14.
 in the organism, origin, localisation, and elimination of (GAUTIER), A., ii, 162, 226.

- Arsenic**, elimination of, from the system (SCHERBATSCHOFF), A., ii, 622.
 metabolism of (GAUTIER), A., ii, 670.
Arsenious oxide, action of, on sulphur chloride (ODDO and SERRA), A., ii, 74.
Arsenic acid, estimation of, iodometrically (GOOCH and MORRIS), A., ii, 686.
Arseno-duodeci- and -luteo-tungstic acids (KEHRMANN and RÜTTIMANN), A., ii, 145.
Arsenic sulphide, action of hydrogen on (PÉLABON), A., ii, 652.
 new sulphide of (As_2S) (SCOTT), T., 651; P., 1900, 69.
Arsenic, detection, estimation, and separation of:—
 Bettendorf's test for (DIETZE; ENELL; FRERICHs), A., ii, 244.
 biological proof of the presence of (ABEL and BUTTENBERG), A., ii, 299.
 biological detection of, in skin, hairs, perspiration, and urine (SCHOLTZ), A., ii, 244.
 detection of, in the organism (SCHERBATSCHOFF), A., ii, 622.
 detection and estimation of, in the organism (GAUTIER), A., ii, 168.
 estimation of, in alloys and metals (HOLLAND and BERTIAUX), A., ii, 438.
 estimation of, in Paris green (SMITH), A., ii, 47; (HAYWOOD; HILGARD), A., ii, 758.
 estimation and separation of antimony and, in ores (BECK and FISHER), A., ii, 312.
 separation of antimony and tin from (MARBURG), A., ii, 248.
Arsenical insecticides, adulteration and analysis of (HAYWOOD; HILGARD), A., ii, 758.
Asbestos, composition of (VAN DER BELLEN), A., ii, 602.
 retention of moisture by (AUCHY), A., ii, 309.
Asbestos filters (LOHSE and THOMAS-CHIEWSKI), A., ii, 508.
Asetic fluid, human, lipolytic ferment in (HAMBURGER), A., ii, 420.
Ash analysis, apparatus for (TUCKER), A., ii, 52; (SHUTTLEWORTH and TOLLENS), A., ii, 111.
 See also Agricultural Chemistry.
Asparagine, accumulation of, in leguminous plants (BRÉAL), A., ii, 301.
Aspergillus niger, proteolytic enzyme produced by (MALFITANO), A., ii, 493.
 nutritive value of raffinose for (GILLOT), A., ii, 99.
Aspergillus Oryzæ, composition of the spores of (ASO), A., ii, 563.
 a ferment of "sake" (KOZAI), A., ii, 743.
Asphalt from Barbados (BEDSON), A., ii, 20.
Aspidin and Aspidinol (HAUSMANN), A., i, 49.
Association. See Affinity.
Astragalose from *Astragalus caryocarpus* (FRANKFORTER), A., ii, 747.
Asymmetry and vitalism (ULPIANI and CONDELLI), A., ii, 463.
Atmospheric air, composition of, at various altitudes (HINRICHS), A., ii, 649.
 combustible gases of (GAUTIER), A., ii, 537, 538, 720.
 heat of vaporisation of (BEHN), A., ii, 260.
 liquid, distillation of, and the composition of the gaseous and liquid phases (BALY), A., ii, 589.
 change in composition of, on evaporation (GROUSINOFF), A., ii, 720.
 influence of the temperature of, on Bacteria (MACFADYEN and ROWLAND), A., ii, 610.
 of forests, high mountains, and the sea (GAUTIER), A., ii, 537, 538.
 of the Tharandt forest, sulphur dioxide in the (WISLICIENUS), A., ii, 38.
 of Paris, combustible gases of the (GAUTIER), A., ii, 537, 720.
 estimation of carbon dioxide in (WALKER), T., 1110; P., 1900, 164; (LETTs and BLAKE), A., ii, 622.
 estimation of formaldehyde in (WINTGEN), A., ii, 117.
Atomic heats, additivity of (MEYER), A., ii, 464.
Atomic theory, Dalton's, genesis of (DEBUS), A., ii, 136.
Atomic weight of a new metal from uranium residues (CURIE), A., ii, 83.
 of barium, boron, bromine, carbon, chlorine, hydrogen, oxygen, silver, sodium, and sulphur (HINRICHS), A., ii, 534.
 of radio-active barium (CURIE), A., ii, 83, 654.
 of boron (GAUTIER), A., ii, 14, 15; (HINRICHS), A., ii, 534, 539.
 of cobalt (RICHARDS and BAXTER), A., ii, 78.
 of gadolinium (BENEDICKS), A., ii, 209; (DEMARÇAY), A., ii, 597.
 of iron (RICHARDS and BAXTER), A., ii, 407.

- Atomic weight of nitrogen** (DEAN), T., 117; P., 1899, 213.
of palladium (HARDIN), A., ii, 85.
of tungsten (SMITH and HARDIN), A., ii, 80.
of yttrium (MUTHMANN and BÜHM), A., ii, 209.
- Atomic weights**, report of the American Committee on (CLARKE), A., ii, 339.
report of the International Commission on (LANDOLT, OSTWALD, and SEUBERT), A., ii, 533.
and crystallography (MUTHMANN), A., ii, 533; (LINCK), A., ii, 717.
in relation to physical properties (SANDER), A., ii, 137; (BAYLEY), A., ii, 188.
and specific heat (TILDEN), A., ii, 524.
- Atoms**, additive nature of the properties of (MEYER), A., ii, 533.
- Atriplex semibaccata*. See Agricultural Chemistry.
- Atropa Belladonna*, estimation of the alkaloids of the leaves of (SCHMIDT), A., ii, 379.
- Atropine**, action of chloroform or ether on (SCHAEER), A., ii, 455.
- i*-**Atropine** from *Scopolia atropoides* roots (HESSE), A., i, 50; (GADAMER), A., i, 356.
- Atroscine**, (*atrosine*, *i*-*scopolamine*, *i*-*hyosine*), from commercial scopolamine (HESSE), A., i, 50; (GADAMER), A., i, 356.
- Augite** from Japan (IWASAKI), A., ii, 286.
from Latium (ZAMBONINI), A., ii, 662.
from Moravia (PELIKAN), A., ii, 662.
- Auramine**, constitution of (STOCK), A., i, 258.
- Austrium** (PRIBRAM), A., ii, 347.
- Autodigestion** of the pancreas (PFÖRRINGER), A., ii, 28.
- Auxidation**. See Oxidation.
- Axinite** from Japan (JIMBŌ), A., ii, 87.
- Azelaic acid** (*heptanedicarboxylic acid*), preparation of (MAQUENNE), A., i, 135.
- Asimino benzene**, ketochlorides and quinones of, and acids therefrom (ZINCKE, STOFFEL, and PETERMANN), A., i, 524.
- Asimino ethylenedicarboxylic acid**. See 1:2:3-Triazole-4:5-dicarboxylic acid.
- Asimino ethylenedicarboxylic acid**. See 1-Hydroxy-1:2:3-triazole-4:5-dicarboxylic acid.
- Asines**, formation of, by the decomposition of semicarbazones (KIPPING), P., 1900, 64; (YOUNG and WITHAM), P., 1900, 78.
- Asocamines and Asocamine oxides**, difference in behaviour of (BAMBERGER and STIEGELMANN), A., i, 193.
- Azobenzene**, electrolysis of (LÖB), A., i, 697; ii, 706.
nitro-derivatives of (WEKNER and STIASNY), A., i, 194; (MEIGEN and NORMANN), A., i, 702.
- Azobenzene-4:3:5'-trisulphonic acid** and its 4'-amino-derivative and their salts (JUNGHAHN), A., i, 418.
- Azo-compounds** differentiated from hydrazone compounds by bromine (ARMSTRONG), P., 1899, 243.
o-amino-, triazines from (BUSCH and HARTMANN), A., i, 59.
- Azo-compounds**. See preceding entries, and also:—
Acetophenoneazobilirubin.
Acetylamino benzene-*o*-1-phenyl-3-methylpyrazolone.
Acetylamino phenylazoacetoacetic acid. Aldazines.
Aniline, diazo salts of.
Anisole diazocyanides.
Anisole diazohaloids.
Anisole diazonium cyanide.
Anisolesyndiotates.
Azodibenzoyl.
Azodicarbamide.
2-Azolepidine.
Azo-mono- and -di-quinoline.
Azotoluene.
Azoxyanisole.
Azoxybenzene.
Azoxydiquinoline.
Benzaldazine.
Benzeneazobenzoylacetone.
Benzeneazo-*o*-dibromophenol.
Benzeneazo-4-chloro-*m*-phenylenediamine.
Benzeneazodiacetylsuccinic acid.
Benzeneazodiphenylamine oxide.
Benzeneazo-ethyl- β -naphthylamine.
3-Benzeneazo-6-hydroxybenzylideneacetophenone.
Benzeneazomethyl aniline oxide.
Benzeneazo- β -naphthol.
Benzeneazo- β -naphthylcarbamic acid.
Benzeneazo-*o*-nitrophenol.
Benzeneazonitrosobenzene.
Benzeneazophenol.
Benzeneazosalicylaldehyde.
Benzene-6-diazoaminoquinoline.
Benzenediazocyanide.
Benzenediazonium salts.
Benzenediazonium-*o*-sulphonic acid.
Bisdiazocetic acid.
Bisdiazobenzene phenyltetrazone.
Bisdiazobenzene-*p*-tolyltetrazone.
Bisdiazomethane (*dihydrotetrazine*).
Bisdiazotetrazones (*octazines*).
Bis-*p*-diazotoluene phenyltetrazone.
Bis-1-phenyl-3-methylpyrazoloneazobenzene.

Azo compounds. See:—

Caffeineazo-compounds.
 Capronaldazine.
 ψ -Cumenediazocyanides.
 ψ -Cumenediazohaloids.
 ψ -Cumenediazonium cyanide.
 ψ -Cumenesyndiazotates.
 Diazoacetic acid.
 Diazoaminobenzene.
 Diazoaminobenzenedi-*p*-sulphonic acid.
 Diazoazobenzenetrisulphonic acid.
 Diazobenzene.
 Diazobenzenebenzylamine.
 Diazobenzene chloride and nitrate.
 Diazobenzenehydrazides.
 Diazobenzene-*m*-hydrazinobenzoic acid.
 Diazobenzeneimide.
 Diazobenzenephenylhydrazide.
 Diazobenzenepiperidide.
 Diazobenzene-*o*-sulphonic acid.
 Diazobenzoic acid phenylhydrazide.
 Diazocaffeine.

- pyocyaneus*, colouring matters of (BOLAND), A., i, 70.
- typhoid, action of toxic products of, on the heart (KEMP and DEWEY), A., ii, 559.
- viscosus brucei*, behaviour of (VAN LAER), A., ii, 158.
- Bacteria**, influence of the temperature of liquid air and of liquid hydrogen on (MACFADYEN and ROWLAND), A., ii, 610.
- influence of metals on broth cultures of (ISACHENKO), A., ii, 230.
- action of solutions of salts of fatty acids on (LÖVINSON), A., ii, 745.
- replacement of potassium salts by rubidium salts in the development of (LOEW), A., ii, 36.
- Bacteria**, influence of, on the decomposition of bones (STOKLASA, DUCHÁČEK, and PITRA), A., ii, 684.
- importance of, for plant development (STOKLASA), A., ii, 360.
- acetic (HENNEBERG), A., ii, 297.
- denitrifying and nitrifying. See Agricultural Chemistry.
- ester-producing (MAASSEN), A., ii, 231.
- Bacterium**, a sugar (WARD and GREEN), A., ii, 33.
- sorbose, oxidation of erythritol by the (BERTRAND), A., i, 377.
- Balance Sheet** of the Chemical Society, March, 1900, and of the Research Fund, March, 1900. See Annual General Meeting, T., 588.
- Balsam**, of *Abies canadensis* (TSCHIRCH and BRÜNING), A., i, 678.
- of *Abies pectinata* (TSCHIRCH and WEIGEL), A., i, 679.
- of *Larix decidua* (TSCHIRCH and WEIGEL), A., i, 680.
- Barbaloins**, and their chloro- and bromo-derivatives (LÉGER), A., i, 512.
- Barbarea praeox*, constituents of (GADAMER), A., i, 49.
- Barbituric acid**, nitroso- (*violuric acid*), heat of dissociation of (ABEGO), A., ii, 190.
- Barium amalgam** (KEPP and BÜTTGER), A., ii, 656.
- Barium salts**, toxic action of, in plant culture (COUPIN), A., ii, 363; (SUZUKI), A., ii, 561.
- Barium aluminates** (ALLEN and ROGERS), A., ii, 727.
- borates, action of carbon dioxide on (MORSE and HORN), A., ii, 626.
- bromide, electrolysis of solutions of (SARGHEL), A., ii, 401.
- chlorate, decomposition products of (SODEAU), T., 137; P., 1890, 157.
- hydroxide, action of hydrogen peroxide on (DE FORCRAND), A., ii, 277.
- peroxides, hydrated (DE FORCRAND), A., ii, 344.
- phosphide, crystallised (JABOIN), A., ii, 76.
- hydroximidosulphate, production of (DIVERS and HAGA), T., 690; P., 1900, 71.
- thioantimonite (POUGET), A., ii, 84.
- Barium**, detection and separation of:—
- Barium**, detection of calcium, strontium, and (DUMESNIL), A., ii, 625.
- separation of strontium, calcium and (KÜSTER), A., ii, 108.
- Barium**, radio-active (v. LENGUEL), A., ii, 402; (GIESEL), A., ii, 480; (DEBIERNE), A., ii, 586.

- Barium**, radio-active, atomic weight of (CURIE), A., ii, 83, 654.
- Barley**. See Agricultural Chemistry.
- Base**, $C_8H_{13}N$, $C_9H_{13}N$, and $C_9H_{17}N$, from methylcycloheptenoneoxime (WALLACH), A., i, 46.
- $C_8H_{15}ON$, from the action of bromine on lupanine hydrochloride (CALLSEN), A., i, 186.
- $C_9H_{15}N$, and $C_9H_{19}N$, from thujaketoneoxime (WALLACH), A., i, 45.
- $C_9H_{17}N$, from fenchocamphorone (WALLACH, NEUMANN, and V. WESTPHALEN), A., i, 241.
- $C_9H_{17}ON$, from pomegranate root (PICCININI), A., i, 110.
- $C_{10}H_9O_2N_6$, from 4-methylpyrimidine and nitric acid (GABRIEL and COLMAN), A., i, 56.
- $C_{12}H_{25}N_2$, from the reduction of leucinimide (COHN), A., i, 466.
- $C_{12}H_{13}O_2N$, by distilling decahydro-acridinedione (VORLÄNDER and KALKOW), A., i, 99.
- $C_{12}H_{15}N$, from $C_{14}H_{17}N$, from tetrahydrocarbazole (PLANCHER), A., i, 562.
- $C_{13}H_{21}ON$, from alcoholic potash and ethyl 2-methylcamphenepyrrole-3-carboxylate (DUDEN and TREFF), A., i, 673.
- $C_{30}H_{18}ON_3$, from the decomposition of $C_{32}H_{26}N_6(NO)_2$, formula of (SCHALL), A., i, 464.
- Wessel's, $C_{32}H_{26}N_6$, and its dinitroso-derivative (SCHALL), A., i, 464.
- $C_{44}H_{41}O_7N$, by the action of alcoholic ammonia on the ethyl ester of the acid $C_{24}H_{24}O_4$ (COEN), A., i, 308.
- Bases**, formation of, from albumin (COHN), A., i, 466.
- from the reduction of camphoceenonitrile (BLAISE and BLANC), A., i, 184.
- from paramucosin (LEATHES), A., i, 318.
- from Californian petroleum (MABERY), A., i, 533.
- action of potassium permanganate on (WILLSTÄTTER), A., i, 404.
- aromatic, action of carbonyl chloride on (VITTENER), A., i, 153.
- See also Pseudo-bases.
- Basicity**, difference of, of the two amino-groups of substituted diamines (BÜLOW), A., i, 690.
- Basic slag**. See Slag, basic, and also Agricultural Chemistry.
- Bassia nut**. See Agricultural Chemistry.
- Bassoria** (HILGER and DREYFUS), A., i, 379.
- Bean oil'** (KOSUTÁNY, WINDISCH, v. HÉRICES-TÓTH, v. SZÉLL, and FALTIN), A., ii, 750.
- Beans**. See Agricultural Chemistry.
- Bdellium resin**, examination of (DIETRICH), A., ii, 118.
- Becquerel rays**. See Photochemistry.
- Bea**, queen, albumin in the cell of the (STÜSS; KLETT), A., ii, 93.
- Beer**, volatile acids in (SPAETH), A., ii, 177.
- detection of furfuraldehyde in (HEIM), A., ii, 327.
- detection of neutralising agents in (SPAETH), A., ii, 177.
- detection of "saccharin" in (RÖSSING), A., ii, 119.
- Beer disease**, a (VAN LAER), A., ii, 158.
- Beeswax**. See Wax.
- Beet molasses**. See Agricultural Chemistry.
- Beetroot**, estimation of sugar in (KOVÁŘ), A., ii, 694.
- See also Agricultural Chemistry.
- Benz-**. See also Benzoyl, and under the Parent Substance.
- Benzal-**. See Benzylidene-.
- Benzaldazine**, reduction of (CURTIUS), A., i, 611.
- Benzaldazines**, nitro- (CURTIUS and LUBLIN), A., i, 700.
- Benzaldehyde**, velocity of the reaction between sodium hydroxide and (POMERANZ), A., i, 552.
- oxidation of, in air (v. BAEYER and VILLIGER), A., i, 487.
- condensation of, with dibenzyl ketone (GOLDSCHMIEDT and KNÖPFER), A., i, 86.
- condensation of, with methyl or ethyl acetonedicarboxylate (PETRENKO-KRITSCHENKO and ELTCHANINOFF), A., i, 307.
- action of, on ethyl- β -naphthylamine (MORGAN), T., 1210; P., 1900, 171.
- action of dry silver oxide and ethyl iodide on (LANDER), T., 746.
- compounds of, with substances belonging to the sugar group (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.
- Benzaldehyde diacetate**, nitro- (THIELE and WINTER), A., i, 500.
- Benzaldehyde pyrrolylhydrazones** (PICCININI and SALMONI), A., i, 562.
- Benzaldoxime**, preparation of (SCHOLL), A., i, 144.
- oxidation of, by Caro's reagent (BAMBERGER), A., i, 500.
- benzylether, and its *p*-bromo-, *p*-chloro-, and *p*-nitro-derivatives (SCHROETER and PESCHKES), A., i, 485.

- Benzaldoximes**, *anti*- and *syn*-, curves of the molecular vibrations of (HARTLEY and DOBBIE), T., 509; P., 1900, 58.
- Benzamide**, action of dry silver oxide and ethyl iodide on (LANDER), T., 736; P., 1900, 6.
- hexachloride*, preparation and properties of (MATTHEWS), T., 1275; P., 1900, 176.
- Benzamide**, 2:4:6-*tribromo*-, sodium salt of, and compound of, with sodium hydroxide (WHEELER), A., i, 492.
- Benzamidine**, condensation of, with the ethyl esters of acetylenedicarboxylic and chlorofumaric acids (RUHEMANN and STAPLETON), T., 809; P., 1900, 122.
- action of, on ethyl phenylpropionate (RUHEMANN and STAPLETON), T., 239; P., 1900, 11.
- Benzanilide** (SILBERRAD), T., 1191.
- o*-bromo- and -chloro-, nitrogen bromides and chlorides from (CHATTAWAY and ORTON), T., 800.
- 3:5-*di*bromo-, and *o*-chloro- (CHATTAWAY and ORTON), A., i, 643.
- Benzaniline**. See Benzophenone, *p*-amino-.
- Benzdiazimide** (MEYER and ROHMER), A., i, 223.
- Benzene**, formation of, from acetylene (SABATIER and SENDERENS), A., i, 470, 471, 534.
- refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.
- boiling-point of, with mixtures of acetone, carbon tetrachloride, chloroform, ether, and methyl alcohol (HAYWOOD), A., ii, 64.
- direct aldoxidation of (SCHOLL), A., i, 144.
- action of chlorine monoxide on (SCHOLL and NÖRR), A., i, 337.
- action of hydrogen peroxide on (CROSS, BEVAN, and HEIBERG), A., i, 534.
- derivatives, formation of tri-substituted from di-substituted (HOLLEMAN), A., i, 387.
- methyl derivatives, oxidation of, by means of acetic anhydride and sulphuric acid (THIBLE and WINTER), A., i, 500.
- vapour and hydrogen, action of platinum- and of palladium-black on (LUNGE and AKUNOFF), A., i, 543.
- vapour, estimation of, in illuminating gas (PFEIFFER), A., ii, 173.
- detection of, in denatured spirit (HALPHEN), A., ii, 446.
- Benzene**, estimation of, in coal gas (HABER), A., i, 629.
- Benzene**, bromo-, rate of formation of (BRUNER), A., ii, 647.
- and *m*-xylene dibromide, action of sodium on a mixture of (PELLEGRIN), A., i, 151.
- pentabromo*- (JACOBSON and LOEB), A., i, 281.
- 4-bromo-3-iodonitro- (WHEELER and VALENTINE), A., i, 26.
- 1:4-*di*bromo-2:3-*dinitro*- ("α-*di*bromodinitrobenzene") (CALHANE and WHEELER), A., i, 146.
- chloro- and bromo-, electrolytic preparation of (VOTOČEK and ZENÍŠEK), A., i, 19.
- chloro-, *tetrachloride*, preparation of (MATTHEWS), T., 1276; P., 1900, 176.
- mono*-, 1:2- and 1:4-*di*-, 1:2:4-*tri*- and 1:2:4:5-*tetra*-chloro-, action of bromine of (MOUNEYRAT and POURRET), A., i, 19.
- 1:2:4-*trichloro*-, and 2:4:5-*trichloro*-1-nitro- (COHN and FISCHER), A., i, 459.
- 4-chloro-3-bromonitro- (WHEELER and VALENTINE), A., i, 26.
- m*-chloriodo- (KLAGES and LIECKE), A., i, 387.
- o*- and *p*-chloronitro-, simultaneous formation of (HOLLEMAN and DE BRUYN), A., i, 638.
- chloro-*dinitro*-, action of, on potassium benzoate and on acetamide (KYM), A., i, 158.
- nitro-, electrolysis of (LÖB), A., i, 697; ii, 706.
- electrolytic reduction of (HABER), A., i, 281; ii, 257; (HABER and SCHMIDT), A., i, 282.
- nitration of (HOLLEMAN), A., i, 387; (HOLLEMAN and DE BRUYN), A., i, 481.
- reduction of, with sodium (SCHMIDT), A., i, 20.
- conversion of, into *o*-nitrophenol (WOHL), A., i, 157.
- o*-, *m*-, and *p*-*dinitro*-, formation of (HOLLEMAN), A., i, 387; (HOLLEMAN and DE BRUYN), A., i, 481.
- trinitro*-, compounds of, with sodium alkyl oxides and with ethyl sodioacetate or sodiomalonate (JACKSON and GAZZOLLO), A., i, 433.
- nitroso-, action of aqueous sodium hydroxide on (BAMBERGER), A., i, 531.
- Benzeneazimonomol**. See 1-Hydroxy-1:2:3-benzotriazole.

- Benzeneazobenzoylacetone**, *p*-nitro-, and its methylimide and phenylimide, and its condensation products with phenylhydrazine and reactions with semicarbazide sulphate, hydroxylamine and hydrochloric acid (BÜLOW), A., i, 65, 66.
- Benzeneazo-*o*-dibromophenol**, its acyl derivatives and ethyl ether (HEWITT and ASTON), T., 712; P., 1900, 89.
- p*-bromo-, and its acyl derivatives and ethyl ether (HEWITT and ASTON), T., 810; P., 1900, 131.
- Benzeneazo-4-chloro-*m*-phenylenediamine** (COHN and FISCHER), A., i, 458.
- Benzeneasodiacetylsuccinic acid**, diethyl ester of, isopyrazole derivatives from (BÜLOW and SCHLESINGER), A., i, 56.
- Benzeneasodiphenylamine oxide**, and *p*-bromo- (BAMBERGER and STIEGELMANN), A., i, 193.
- Benzeneasoethyl- β -naphthylamine**, *p*-nitro- (MORGAN), T., 1214.
- 3-Benzeneazo-6-hydroxybenzylideneacetophenone** (BORSCHKE), A., i, 419.
- Benzeneasomethylaniline oxide**, and *p*-bromo- (BAMBERGER and STIEGELMANN), A., i, 193.
- Benzeneazo- β -naphthol** (MÖHLAU and STROHBACH), A., i, 368.
- Benzeneazo- β -naphthylcarbamio acid**, ethyl ester (BUSCH and HARTMANN), A., i, 60.
- Benzeneazo-*o*-nitrophenol**, preparation, properties, and reactions of, and its acetyl and benzoyl derivatives (HEWITT), T., 99; P., 1899, 229.
- Benzeneazonitrosobenzene** (WERNER and STIASNY), A., i, 194.
- Benzeneasophenol**, bromination of (HEWITT and ASTON), T., 712, 810; P., 1900, 89, 131.
- nitration of (HEWITT), T., 99; P., 1899, 229.
- Benzeneasophenol**, *p*-nitro- and its acetyl and benzoyl derivatives, and *p*-amino-, and its acetyl derivatives (MELDOLA and WILLIAMS), P., 1899, 196.
- Benzeneasosalicylaldehyde** and the action of acetophenone on (BORSCHKE), A., i, 419.
- Benzeneacyanonitric acid**, dinitro- (trinitrobenzene cyanhydrin) (HANTZSCH and KISSEL), A., i, 90.
- Benzene-6-diazoaminoquinoline** (KNUFFEL), A., i, 188.
- Benzenediazocyanide** and its bromine derivatives and their dissociation to diazonium cyanides (HANTZSCH), A., i, 568.
- Benzenediazonium**. See Diazonium.
- Benzenediazonium-*o*-sulphonic acid** (diazobenzene-*o*-sulphonic acid), *p*-bromo-, and *syn*-diazotates from (GERILOWSKI), A., i, 706.
- Benzene-mono- and tri-dimetaphosphoric acids** (GIRAN), A., i, 146.
- Benzene-*o*-disulphonic acid** and its salts derivatives (ARMSTRONG and NAPPER), P., 1900, 160.
- Benzene potassium cyanide**, trinitro- (HANTZSCH and KISSEL), A., i, 90.
- Benzene ring**, gradual synthesis of the (DELAORE), A., i, 603.
- law governing the elimination of halogens from the (KLAGES and LIECKE), A., i, 387.
- Benzenestearosulphonic acid**. See Sulphophenylstearic acid.
- r*- α -**Benzenesulphaminobutyric acid** (FISCHER and MOUNEYRAT), A., i, 647.
- Benzenesulphocamphenamide** (DUDEN and MACINTYRE), A., i, 302.
- Benzenesulphonamides** of primary bases (DUDEN), A., i, 282; (WILLSTÄTTER and LESSING), A., i, 304.
- Benzenesulphone- and Benzenesulphone-methyl-*o*-anisidine** (DIEFOLDER), A., i, 191.
- Benzenesulphonic acid**, aromatic esters of, and compounds of, with aminophenols and acids (GEORGESCU), A., i, 343.
- 1:2:3:4-Benzenetetra-carboxylic acid** (*prehnitic acid*) (DOEBNER), A., i, 500.
- Benzenoid hydrocarbons**, refractive and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.
- action of cyanogen bromide and aluminium chloride on (SCHOLL and NÖRR), A., i, 386.
- Benzoyl-*o*-aminophenol**, *m*-nitro- (RANSON), A., i, 218.
- Benzoylanilinoxime**, its nitro-derivatives, and dinitrophenyl ethers (WERNER and HERBERGER), A., i, 58.
- Benzoylmethyliminocchloride**, decomposition of (V. PECHMANN and OBERMILLER), A., i, 294.
- pp*-Benzhydroidicarboxylic acid** (LIMPRICHT), A., i, 599.
- Benzhydroxamic acid** from the oxidation of benzaldoxime (BAMBERGER), A., i, 500.
- its acetyl, benzoyl, and chloro-derivatives (VAN RAALTE), A., i, 147.
- Benzidine**, electrolytic preparation of (LÖB), A., i, 697; ii, 706.
- colour test for (WOLFF), A., ii, 119.
- "**Benzidine, cyano-**" platinichloride (MEVES), A., i, 484.
- Benzil**, action of ethyl mercaptan on (LLAGUET), A., i, 503.

- β*-Benzildioxime**, double compounds of, with certain solvents (PETRENKO-KRITSCHENKO and KASANEZKY), A., i, 350.
- Benzimino-ethers**, rearrangement of (WHEELER), A., i, 293; (WISLICENUS and GOLDSCHMIDT), A., i, 435.
- Benzoic acid**, electrical conductivity of, influence of substituents on (TINGLE), A., ii, 6.
- oxidation of, in presence of ferrous salts (FENTON and JONES), T., 76; P., 1899, 224.
- mercury derivative of (PESCI), A., i, 548.
- potassium salt, action of chlorodinitrobenzene on (KYM), A., i, 158.
- hexachloride, preparation of (MATTHEWS), T., 1276; P., 1900, 176.
- Benzoic acid**, *p*-acetylaminobenzoylmethyl, acetylaminobenzoylmethyl, and *p*-amino-*m*-dimethylbenzoylmethyl esters (KUNCKELL), A., i, 663.
- o*-benzoylaminophenyl and *o*-benzoylmethylaminophenyl esters of, and their nitro-derivatives (RANSOM), A., i, 219.
- phenyl, *p*-tolyl, and thymyl esters, formation of (BODROUX), A., i, 224.
- Benzoic acid**, *o*-amino-. See Anthranilic acid.
- m*- and *p*-amino-, glycinyl derivatives of the esters of (EINHORN and OFFENHEIMER), A., i, 493.
- p*-amino-, action of ethyl acetoacetate and substituted acetoacetates on, in presence and absence of pyridine (TROEGER), A., i, 226.
- diaminocyno-, quinoneimide of (NIETZKI and PETRI), A., i, 486.
- 2:3:4:6-tetramino-5-cyano- (NIETZKI and PETRI), A., i, 486.
- m*-chloro-, nitration of (HOLLEMAN and DE BRUYN), A., i, 638.
- o*-, *m*-, and *p*-chloro-, and their derivatives, nitration of (HOLLEMAN), A., i, 388; (MONTAGNE), A., i, 491.
- methylamides of (MONTAGNE), A., i, 491.
- iodoso- (m. p. 228°) (VANINO and UHLFELDER), A., i, 371.
- m*-nitro-, ethyl ester, chloro- and bromo-imide of (STIEGLITZ and SLOSSON), P., 1900, 2.
- o*-, *m*-, and *p*-nitro-, formation and nitration of (HOLLEMAN), A., i, 387.
- thio- and nitrothio-, and their dinitrophenyl esters (KYM), A., i, 190.
- Benzoic chloride**, action of, on *s*-3:6-dimethylidihydrotriazine (SILBERRAD), T., 1185; P., 1900, 169.
- Benzoic chloride**, additive compound of, with aluminium chloride (KRONBERG), A., i, 502.
- Benzoic chloride**, 2:5-, 3:4-, and 4:3-chloronitro-, methylamides of (MONTAGNE), A., i, 491.
- Benzoic hydrogen peroxide** (v. BAeyer and VILLIGER), A., i, 328, 437.
- Benzoic peroxides**, bromo-, iodo- and nitro- (VANINO and UHLFELDER), A., i, 371.
- o*-Benzoisulphinide**. See "Saccharin."
- Benzoin**, action of ethyl mercaptan on (LLAGUET), A., i, 503.
- action of dry silver oxide and alkyl iodides on (LANDER), T., 783; P., 1900, 6, 90.
- Benzoin-β-phenylhydrazones**, action of benzoic chloride on (FREER), A., i, 124.
- Benzonitrile**, specific heat and heat of vaporisation of (LUGININ), A., ii, 334.
- hydrolysis of (RABAUT), A., i, 170.
- Benzonitrile hexachloride**, preparation and properties of (MATTHEWS), T., 1273; P., 1900, 175.
- Benzonitroic acid**, dinitro-, barium salt (HANTZSCH and KISSEL), A., i, 90.
- Benzophenone**, allotropy of (OECHSNER DE CONINCK), A., i, 236.
- solubility of (DERRIEN), A., i, 299.
- additive compound of, with aluminium chloride (KRONBERG), A., i, 502.
- new derivative of (OECHSNER DE CONINCK and DERRIEN), A., i, 502.
- Benzophenone**, *p*-amino- (*benzaniline*) derivatives of (DINGLINGER), A., i, 503.
- Benzophenone-3:4'-dicarboxylic acid** (LIMPRICHT), A., i, 32.
- Benzophenone-4:4'-dicarboxylic acid** (LIMPRICHT), A., i, 598.
- Benzophenone diethyl, diphenyl, and ditolyl diketones** (LIMPRICHT), A., i, 32.
- Benzophenonediphenyldiketonedicarboxylic acid** (LIMPRICHT), A., i, 32.
- Benzophenonephenylacetylene** (NEF), A., i, 21.
- Benzopyrines**, metallic (SCHUYTEN), A., i, 57.
- Benzo-γ-pyrone** and its carboxylic acid (RUHEMANN and STAPLETON), T., 1180; P., 1900, 168.
- p*-Benzoxymesityl bromide and ethyl ether, dibromo- (AUWERS, TRAUN, and WELDE), A., i, 169.
- Benzoyl-**. See also under Parent Substance.
- Benzoylacetetic acid** (RUHEMANN and STAPLETON), T., 1180; P., 1900, 168.

- Benzoylacetone**, *dithio*-, action of hydroxylamine and phenylhydrazine on (VAILLANT), A., i, 239.
- Benzoylaconitic acid**, ethyl ester of (RUHEMANN and STAPLETON), T., 804; P., 1900, 121.
- Benzoyl- α -aminobutyric acids**, *d*-, *l*-, and *r*-, (FISCHER and MOUNEYRAT), A., i, 647.
- α -Benzoylaminocinnamic anhydride**, action of amines on (ERLENMEYER), A., i, 549.
- α -Benzoylaminocinnamide** (ERLENMEYER), A., i, 549.
- Benzoylaminodiphenylguanidine** (BUSCH and BAUER), A., i, 415.
- o*-Benzoylaminophenol** and its *o*-methyl-compound and their benzoates and nitro-derivatives (RANSOM), A., i, 218.
- Benzoylaminosulphonol** (POSNER and FAHRENHORST), A., i, 16.
- p*-Benzoylanilinocinnamylformic acid**, *p*-benzanilide of (DINGLINGER), A., i, 503.
- Benzoylanisoylmethane** (POND, MAXWELL, and NORMAN), A., i, 102.
- Benzoylanthranilic acid** (PSCHORR and WOLFF), A., i, 170.
- Benzoyl-*l*-aspartic acid** and its salts (SCHULTZE), A., i, 596.
- Benzoylation** in presence of pyridine (MINUNNI), A., i, 214.
- o*-Benzoylbenzenesulphonic acid**, *p*-nitro-, and its salts and chloride (HOLLIS), A., i, 292.
- Benzoylbenzhydrol** (NEF), A., i, 21.
- Benzoylbenzimidazole ether**, action of ethyl iodide on (WHEELER), A., i, 294.
- o*-Benzoylbenzoic acid**, tautomerism of (HALLER and GUYOT), A., i, 170.
- 3:6-dichloro- and tetrachloro-**, esterification of (GRAEBE), A., i, 548.
- Benzoylbenzylidenehydrazide** (MINUNNI and CARTA-SATTA), A., i, 252; (CURTIUS), A., i, 701.
- Benzoylisobutylamide** (WHEELER), A., i, 293.
- Benzoyl-carbamides** and ψ -carbamides, formation of (WHEELER and JOHNSON), A., i, 632.
- Benzoylcarbaminothioglycollic acid** (WHEELER and JOHNSON), A., i, 633.
- Benzoylcarbinol**, *p*-amino-, and its hydrochloride and phenylhydrazone (KUNCKELL), A., i, 663.
- Benzoylcarbonyl-*o*-aminophenol** and *m*-nitro- (RANSOM), A., i, 218.
- Benzoyl-*s*-dibenzyl-*i*-diphenylethylenediamine** ("*dibenzylamarine*") (JAPP and MOIR), T., 608; P., 1899, 211.
- Benzoyl-*s*-dimethyl- and -*s*-diethyl-*i*-diphenylethylenediamine** ("*dimethyl*-" and "*diethyl-amarine*") (JAPP and MOIR), T., 608; P., 1899, 211.
- Benzoylfurfurylidenehydrazide** (MINUNNI and CARTA-SATTA), A., i, 252.
- Benzoylglutamic acid** and its salts (SCHULTZE), A., i, 596.
- 3-Benzoyl-4-hydroxyisocarbostyryl** (GABRIEL and COLMAN), A., i, 689.
- Benzoyliminothiocarbonic acid**, esters, formation of (WHEELER and JOHNSON), A., i, 634.
- Benzoylleucine** and its salts (SCHULTZE), A., i, 595.
- Benzoyl-*r*-leucine**, resolution of, into its active components (FISCHER), A., i, 646.
- o*-Benzoylmethylamino-phenol** and **-phenyl ethyl carbonate** (RANSOM), A., i, 219.
- β -Benzoyl- α -methylpropionic acid** (*phenylmethylbutanoic acid*), synthesis of (KLOBB), A., i, 497.
- 4-Benzoylnicotinic acid** (FULDA), A., i, 53.
- Benzoylphenetidinesulphonic acid** (COHN), A., i, 29.
- Benzoylphenylacetylene** and its diiodide (NEF), A., i, 21.
- action of potash on** (MOUREU and DELANGE), A., i, 397.
- Benzoyl-*d*-phenylalanine** (FISCHER and MOUNEYRAT), A., i, 647.
- p*-Benzoylphenyl-carbimide**, and **-methylurethane** (DINGLINGER), A., i, 503.
- $\alpha\alpha$ -Benzoylphenylhydrazide**, action of heat on (SILBERRAD), T., 1190; P., 1900, 169.
- α -Benzoylphenylhydrazide-*trichloroquinone*** (MCIPHERSON and FISCHER), A., i, 411.
- s*-Benzoylphenylhydrazine-*p*-sulphonic acid** (FICHTER and SCHIESS), A., i, 366.
- p*-Benzoylphenylexamic acid**, ethyl ester (DINGLINGER), A., i, 503.
- p*-Benzoylphenylsuccinimide** (DINGLINGER), A., i, 503.
- p*-Benzoylphenylthio-carbamide** and **-carbimide** (DINGLINGER), A., i, 503.
- p*-Benzoylphenylurethane** (DINGLINGER), A., i, 503.
- β -Benzoylpropionic acid** (DEBOGLAFF), A., i, 490.
- Benzoyl-2:4:6:4'-tetramethoxyacetophenone** (CZAJKOWSKI, v. KOSTANECKI, and TAMBOR), A., i, 504.
- Benzoylthiamide**, *p*-bromo- (SAULMANN), A., i, 687.

- Benzoylthiocarbimide**, reactions of, with imino-ethers (WHEELER and SANDERS), A., i, 563.
- Benzoyl-*r*-tyrosine**, resolution of, into its optically active components (FISCHER), A., i, 172.
- Benzoylusnic acid** and its oxime (PATERNO), A., i, 662.
- Benzyl alcohol**, action of methylene sulphate on (DELÉPINE), A., i, 163. *m*-nitro-*p*-amino- and its anhydro-derivative (MEYER and ROHMER), A., i, 222.
- Benzyl chloride**, *p*-cyano-, reactions of (MOSES), A., i, 658. cyanide. See Phenylacetoneitrile. hydrogen sulphate (DELÉPINE), A., i, 164. iodide, *p*-chloro- (VAN RAALTE), A., i, 147. nitrate (NEF), A., i, 5. thiocyanate, *p*-cyano-, reactions of (MOSES), A., i, 658.
- β -Benzylallylamine** and its salts (POSNER and FAHRENHORST), A., i, 18.
- Benzylaminocarboxylic acid**. See Phenylacetic acid, amino-.
- Benzylaminochloroindone** (LANSER and WIEDERMANN), A., i, 667.
- 3-Benzylamine-1-indone** (SCHLOSSBERG), A., i, 665.
- Benzylisoamylamine** (EINHORN and PFEIFFER), A., i, 222.
- Benzylaniline**, *o*-chloro-, and its nitroso-derivative (BAMBERGER and MÜLLER), A., i, 706.
- Benzylanilinesulphonic acids** (SMEDLEY), P., 1900, 160.
- Benzylascimide** (WOHL and OESTERLIN), A., i, 698; (CURTIUS), A., i, 699.
- Benzylbenzylaminooxime** and its 2:4-dinitrophenyl ether (WERNER and HERBERGER), A., i, 59.
- Benzylbenzylidenhydrazine** and its acetyl derivative (WOHL and OESTERLIN), A., i, 698. and its salts (CURTIUS), A., i, 611.
- Benzylbutylamines** (EINHORN and PFEIFFER), A., i, 222.
- Benzylcamphor**, bromo- (HALLER and MINGUIN), A., i, 452.
- Benzylcarbinol** (β -phenylethyl alcohol) from German oil of roses (v. SODEN and ROJAHN), A., i, 489. in rose blossoms (WALBAUM), A., i, 509, 645.
- Benzylchloroformoxime** (BIDDLE), A., i, 137.
- Benzylidguanide** (BRUTEL), A., i, 367.
- Benzylidimethylcarbinol** (GRIGNARD), A., i, 382.
- Benzylethylthetine** platinichloride (STRÖMHOLM), A., i, 326.
- Benzylformhydroxamic acid** (BIDDLE), A., i, 137.
- Benzylhydrazine** and its hydrochloride and nitroso-derivative (WOHL and OESTERLIN; CURTIUS), A., i, 698. synthesis of, and its dibenzoyl derivative (CURTIUS), A., i, 610. reduction of benzylidenhydrazine to (CURTIUS), A., i, 700.
- Benzyl-*o*-hydroxybenzylidenhydrazine** (CURTIUS), A., i, 611.
- α -Benzylhydroxylamine** and action of ethyl formate on (SCHROETER and PESCHKES), A., i, 485.
- Benzylidenacetoxime**, oxidation of (HARRIES), A., i, 504.
- Benzylideneaminodiphenylguanidine** (BUSCH and BAUER), A., i, 414.
- Benzylideneaminodi-*o*- and -*p*-tolyl-guanidines** (BUSCH and BAUER), A., i, 415.
- Benzylideneaniline**, *o*-chloro- (BAMBERGER and MÜLLER), A., i, 706.
- Benzylidenearsine**, formation of (YOUNG and WITHAM), P., 1900, 73. *m*- and *p*-nitro- (MINUNNI and CARTASATTA), A., i, 251.
- Benzylidenebisacetonedicarboxylic acid**, methyl ester (PETRENKO-KRITSCHENKO and ELTCHANINOFF), A., i, 307.
- Benzylidenebisacetylacetones**, six isomeric, preparation and configuration of (SCHIFF), A., i, 39.
- Benzylidenebisdihydroresorcinol**, and Benzylidenebisdimethyl- and -phenyldihydroresorcinol (VORLÄNDER and STRAUSS), A., i, 100.
- Benzylidenebis-gallacetophenone** and -resacetophenone and its ethyl ether, and their acetyl derivatives (BLUMSTEIN and V. KOSTANECKI), A., i, 448.
- Benzylidenebis-2-methylindole** (v. WALTHER and CLEMEN), A., i, 408.
- Benzylidenecampholic acid** (HALLER and MINGUIN), A., i, 452.
- Benzylidenecamphor**, action of hydrogen bromide on (HALLER and MINGUIN), A., i, 452.
- r*-Benzylidenecamphor**, resolution of; isomorphism of the active components (MINGUIN), A., i, 301.
- Benzylidenedihydroisocamphor** (RIMINI), A., i, 554.
- Benzylidenefluorene** (phenyldiphenylene-ethylene) (THIELE), A., i, 347.
- Benzylidenehydantoin** and **Benzyliden-imino- and -thio-hydantoin** (RUHMANN and STAPLETON), T., 241; P., 1900, 12.

- Benzylidenedihydrazine**, reduction of, to benzylhydrazine (CURTIUS), A., i, 700.
- o-, m-, and p-nitro-, and their reactions (CURTIUS and LUBLIN), A., i, 700.
- Benzylidene-2-lepidyl- and -4-quin-aldyl-hydrazine** (MARCKWALD and CHAIN), A., i, 521.
- Benzylidene-2-naphthylamine**, 1-bromo- and 1-chloro-, and their hydrocyanides and o- and p-nitro-derivatives (MORGAN), T., 1216; P., 1900, 171.
- Benzylidenescobornylamine** (FORSTER and HART-SMITH), T., 1157; P., 1900, 166.
- "**Benzylidenephenyldihydroresorcinol**." See Triphenyloctohydroxanthenedione.
- Benzylidenephenylhydrazone** (MORGAN), T., 1210.
- Benzylidene-mono- and -di-quinaldine and -lepidine** (KOENIGS), A., i, 189.
- Benzylidene-2-quinolyldihydrazine** and its salts (MARCKWALD and MEYER), A., i, 519.
- Benzylidenesemicarbazone**, oxidation of (YOUNG and WITHAM), T., 226; P., 1900, 5.
- 1-Benzylidene** (MARCKWALD), A., i, 434.
- Benzylisuretine** (BIDDLE), A., i, 137.
- Benzylmethylollepidine** (KOENIGS), A., i, 189.
- Benzyl-mono- and -di-methylolquinaldine** (KOENIGS), A., i, 189.
- Benzylmethylsulphine iodide** and **Benzylmethylisopropylsulphine platinichloride** (STRÖMHOLM), A., i, 326.
- Benzyl-α-naphthaquinone**, 2-chloro-3-α-cyano- (MICHEL), A., i, 669.
- Benzylloximinoformyl ethyl, acetyl, and benzoyl oxides**, and **Benzylloximino-diacetyl oxide** (BIDDLE), A., i, 138.
- Benzylloxycarbamide**, p-bromo- and p-chloro- (SCHROETER and PESCHKES), A., i, 485.
- Benzylphenylnitrosamine**, p-nitro- (BAMBERGER and MÜLLER), A., i, 706.
- Benzylquinaldine**, compound of, with chloral (KOENIGS), A., i, 189.
- Benzylisoquinolines**, 4-, 3-, and 1- (RÜGHEIMER), A., i, 522.
- Benzylsemicarbazide** (CURTIUS), A., i, 611.
- Benzylsulphide-p-dicarboxylic acid** and its nitrile (MOSES), A., i, 658.
- β-Benzylsulphoneallylphthalamide** (POSNER and FAHRENHORST), A., i, 18.
- Benzylthiocarbimide**, action of, on *Saccharomyces mycoderma* (TER MEULEN), A., i, 511.
- Berberine phosphate**, composition of (SHEDDEN), A., i, 683.
- estimation of (TROEGER and LINDE), A., i, 515.
- Bergamot oil** (CHARABOT), A., ii, 101; (SOLDANI and BERTÉ), A., ii, 173.
- Beryllium ammonium phosphate**, estimation of beryllium in (AUSTIN), A., ii, 49.
- separation of, from iron (HAVENS and WAY), A., ii, 50.
- Bendantite** (HARTLEY), A., ii, 601; (PRIOR), A., ii, 602.
- Bile**, human (v. ZEYNEK), A., ii, 29.
- as a digestive juice (BRUNO), A., ii, 553.
- as a solvent (MOORE), A., ii, 291.
- Bile pigments**, detection of, in urine (HAMMARSTEN), A., ii, 637.
- Bilirubin**, detection of, in urine (ARNOLD), A., ii, 114.
- Binnite**, identity of, with tennantite (PRIOR and SPENCER), A., ii, 21.
- Biological chemistry**, ethical and scientific questions of (THUDICHUM), A., ii, 609.
- Biotite** (?) from Japan (JIMBÓ), A., ii, 87.
- Birds**, digestion in (PAIRA-MALL), A., ii, 553.
- Bis-β-diamyldisulphonepropylthiocarbamide** (POSNER and FAHRENHORST), A., i, 17.
- Bisdiazooacetic acid** (HANTZSCH and SILBERRAD), A., i, 261.
- Bisdiazobenzenephenyltetrazone** and its halogen derivatives (WOHL and SCHIFF), A., i, 707.
- Bisdiazobenzene-p-tolyltetrazone** (WOHL and SCHIFF), A., i, 708.
- Bisdiazotetrazones (ozonones)**, formation of (WOHL and SCHIFF), A., i, 706.
- Bis-p-diazotoluenephenyltetrazone** (WOHL and SCHIFF), A., i, 707.
- Bisdiazomethane**. See Dihydratotetrazine.
- Bis-β-diethylidisulphonepropylthiocarbamide** (POSNER and FAHRENHORST), A., i, 16.
- Bismuth alloys** with sodium, composition and melting point of (KURNAKOFF), A., ii, 277.
- Bismuth salts**, action of sodium thiosulphate on (FAKTOR), A., ii, 692.
- Bismuth chloride**, double salts of, with organic bases (HAUSER and VANINO), A., i, 641.
- oxybromide, oxychloride, and oxyiodide (DE SCHULTEN), A., ii, 353.
- suboxide and subsulphide (SCHNEIDER), A., ii, 212.

- Bismuth, trioxide**, action of, on sulphur chloride (ODDO and SERRA), A., ii, 74.
- peroxide**, action of hydrogen sulphide on (VANINO and HAUSER), A., ii, 279.
- sulphates** (ADIE), P., 1899, 226.
- Bismuth organic compounds**:—
- compounds of, with phenols (RICHARD), A., i, 593.
- cobalticyanide (MILLER and MATHEWS), A., ii, 318; (MATHEWS), A., ii, 578.
- Bismuth, estimation and separation of**:—
- estimation of, electrolytically (BALACHOWSKI), A., ii, 578.
- separation of, from lead (CLARK), A., ii, 371.
- Bisnitrosocyclohexanonecarboxylic acid**, diethyl ester (DIECKMANN), A., i, 297.
- Bisnitrosocyclopentanonecarboxylic acid**, diethyl ester (DIECKMANN), A., i, 297.
- p-Bis-1-phenyl-3-methylpyrazoloneazobenzene** (BÜLOW), A., i, 261.
- Bisisopropylasimethylene**. See *iso-Butaldazine*.
- Dispulegone** (HARRIES and ROEDER), A., i, 183.
- Bitumen from Bohemia** (EICHLFITER), A., ii, 354.
- Bitumens**, estimation of sulphur in (S. F. and H. E. PECKHAM), A., ii, 44; (LANGMUIR), A., ii, 310.
- Bleaching powder**, estimation of chlorine in (WOLOWSKI), A., ii, 165.
- Blood**, electrical conductivity of (OKER-BLOM), A., ii, 290, 356, 607.
- specific heat of (BORDIER; BERTHELOT), A., ii, 356.
- relationship of constants of the (JELLINEK and SCHIFFER), A., ii, 152.
- changes in the composition of, after transfusion of sodium chloride, and their relationship to diuresis (MAGNUS), A., ii, 665.
- chemical changes in, from feeding with ammonium sulphate (RUMPF and SCHUMM), A., ii, 417.
- influence of the concentration of, on the tension of carbon dioxide in it (GRANDIS), A., ii, 604.
- influence of moisture on the passage of carbon dioxide from, to the air (GRANDIS), A., ii, 604.
- colouring matter of (NENCKI and ZALESKI), A., i, 709.
- changes in the ether-soluble substances in the (WEIGERT), A., ii, 738.
- hydroxyl-ions of the (HÖBER), A., ii, 738.
- Blood**, iodine in the (GLEY and BOURCET), A., ii, 555.
- oxygen in human (LOEWY), A., ii, 357.
- oxygen capacity and volume of, in man (HALDANE and SMITH), A., ii, 416, 665.
- volume and oxygen capacity of, in chlorosis and pernicious anemia (SMITH), A., ii, 416.
- the ferricyanide method of determining the oxygen capacity of (HALDANE), A., ii, 458.
- oxyhæmoglobin crystals from pigeons' (SCHWANTKE), A., i, 711.
- proteids of, action of lymphagogues on (TIMOFFEFFSKY), A., ii, 95.
- action of antileucocytic serum on the (DELEZENNE), A., ii, 423, 554.
- of mother and foetus, effect of ingested alcohol on the (NICLOUX), A., ii, 416.
- detection of (STRZYZOWSKI), A., ii, 123.
- detection of carbon monoxide in (IPSEN; WACHHOLZ), A., ii, 169.
- estimation of alcohol in, in acute alcoholism (GRÉHANT), A., ii, 95, 112.
- simultaneous estimation of two colouring matters in (HÜFNER), A., ii, 459.
- apparatus for the clinical estimation of phosphorus in (JOLLES), A., ii, 311.
- estimation of the reducing power of (ROSIN), A., ii, 319.
- estimation of uric acid and purine bases in (HIS and HAGEN), A., ii, 769.
- Blood corpuscles**, influence of, on the electrical conductivity of blood (OKER-BLOM), A., ii, 290, 356, 607.
- agglutination of, by chemical agents (HÉDON), A., ii, 665.
- red, and hæmolytic serum (CANTACUZÈNE), A., ii, 741.
- of animals, sodium and potassium in the (BOTTAZZI and CAPPELLI), A., ii, 225.
- Blood-formation**, relationship of iron to (ABDERHALDEN), A., ii, 223, 289, 416; (HOFMANN), A., ii, 491.
- Blood-gases**, action of the, on respiration (PLAVEC), A., ii, 238.
- Blood molasses**. See *Agricultural Chemistry*.
- Blood-pressure**, influence of minimal doses of suprarenal extracts on (MOORE and PURINTON), A., ii, 737.
- Blood-serum**, the anti-rennin of, in pathological conditions (ACHARD and CLERCQ), A., ii, 557.

Bocconia cordata, alkaloids of (MURRILL and SCHLOTTERBECK), A., i, 686.

Body, temperature of the, during fasting, and the speed of assimilation of carbohydrates, proteids, and fats (MOSSO), A., ii, 605.

Boiler water, influence of temperature and concentration on the saline constituents of (CRIBB), A., ii, 542.

Boiling point, relation between the melting point and, in hydrocarbons (BAYLEY), A., i, 369.

of mixtures of chloral and water (CHRISTENSEN), A., i, 626.

constant, of liquid mixtures (RYLAND), A., ii, 64.

increase in, of dilute solutions (SMITS), A., ii, 708.

of various substances (LADENBURG and KRÜGEL), A., ii, 258.

Boiling point apparatus (JONES), A., ii, 187; (BATELLI and STEFANINI), A., ii, 709.

Beckmann's, simplification of (BIGELOW), A., ii, 9.

for securing steady pressure during determinations (SMITS), A., ii, 388.

Boiling point curves of liquid mixtures (HAYWOOD), A., ii, 64; (SPEYERS), A., ii, 464.

Bone, mucin from (GIES), A., i, 317.

Bone meal. See Agricultural Chemistry.

Boragineæ, poisonous alkaloids of the (GREIMER), A., i, 683.

Borax. See Sodium baborate.

Borneol and *iso*Borneol, action of zinc dust on (SEMMLER), A., i, 351.

Borneols, sodium, action of aromatic aldehydes on (HALLER), A., i, 301.

Borneol, β -amino-, and its salts (DUDEN and MACINTYRE), A., i, 674.

Bornyl chloride and iodide, relation of, to pinene hydrochloride and hydriodide (WAGNER and BRICKNER), A., i, 46.

Bornylamine salts, and their molecular rotation (FORSER and HART-SMITH), T., 1152; P., 1900, 166.

Bornylene (WAGNER and BRICKNER), A., i, 554.

β -Bornylhydroxylamine (*1-hydroxyl-aminocamphane*) (FORSTER), T., 255; P., 1900, 14.

Bornylloxamide (FORSTER and HART-SMITH), T., 1155; P., 1900, 166.

Boron, atomic weight of (GAUTIER), A., ii, 14, 15; (HINRICHS), A., ii, 534, 539.

Boric acid, dissociation constant of (WALKER and CORMACK), T., 16; P., 1899, 208.

as a food preservative (RIDEAL and FOULERTON), A., ii, 560; (HEHNER), A., ii, 561.

Boron :—

Boric acid, esters of (WOHL and NEUBERG), A., i, 131.

qualitative test for (E. M. and M. L. WADE), A., ii, 758.

detection of, in borates (BORN-TRÄGER), A., ii, 439.

estimation of (JONES), A., ii, 47; (STOCK), A., ii, 312; (FISCHER), A., ii, 367; (WOLFF), A., ii, 435; (MORSE and HORN), A., ii, 626.

estimation of, in preserved meat and separation of, from borax (BEYTHIEN and HEMPEL), A., ii, 313.

estimation of, in tourmaline (SARGENT), A., ii, 47.

Borates, metallic (OUVRARD), A., ii, 206, 207.

Hyperborates, fluoro- (MELIKOFF and LORDKIPANIDZE), A., ii, 138, 139.

Brain, chemistry of the (BARBIERI), A., ii, 671.

Brandy, estimation of alcohols in (ADAM), A., ii, 53.

Brass, electrolytic deposition of (MORGAN), A., ii, 345.

Brasilein, constitution of (v. KOSTANECKI and FEUERSTEIN), A., i, 355.

Brasilin (GILBODY and PERKIN), P., 1899, 241.

constitution of (GILBODY, PERKIN, and YATES), P., 1900, 107; (v. KOSTANECKI and FEUERSTEIN), A., i, 355.

as a photographic developer (LEPETIT), A., ii, 519.

Bread-making, relation of the constituents of flour to (GUESS), A., ii, 584.

Breads, white and whole-meal, composition of, and digestion experiments with (ROSENHEIM and SCHIDROWITZ), A., ii, 289.

Brewery residues. See Agricultural Chemistry.

"Brilliant fast red G," synthesis of (KOHNER), A., i, 455.

Britholite from Greenland (WINTHER), A., ii, 413.

Bromal, compounds of, with formaldehyde (PINNER), A., i, 427.

Bromination by means of aluminium bromide (POURET), A., i, 369.

Bromine, spectrum of (EDER and VALENTA), A., ii, 330.

vapour density of, at high temperatures (PERMAN and ATKINSON), A., ii, 398.

action of, on phenol and cresols (DITZ and CEDIVODA), A., ii, 54.

physiological action of (FESSEL), A., ii, 227.

- Bromine compounds**, effect of very low temperatures on the colour of (KASTLE), A., ii, 528.
- Hydrobromic acid** (*hydrogen bromide*), preparation of pure (SCOTT), T., 648; P., 1900, 69.
- influence of, on the bromination of trimethylene (GUSTAVSON), A., i, 535.
- Bromates and hypobromites**, formation of, by the electrolysis of the bromides of the alkaline earth metals (SARGHEL), A., ii, 400.
- Hypobromous acid**, action of, on anilides (CHATTAWAY and ORTON), T., 789, 797; P., 1900, 102, 112; (CHATTAWAY, ORTON, and HURLEY), A., i, 152; (ARMSTRONG), T., 1047; P., 1900, 160.
- action of, on diacetyl-*m*-phenylenediamine (MORAN), T., 1203; P., 1900, 170.
- action of, on unsaturated acids (MELIKOFF), A., i, 536.
- Bromine, estimation and separation of**—
- estimation of, in presence of chlorine and iodine (v. WESSELSZKY), A., ii, 436.
- separation of, from chlorine and iodine (CROTOGINO), A., ii, 642.
- Bromoform**, action of, on dimethylpyrrolines (BOCCHI), A., i, 357.
- compound of, with aluminium bromide and carbon disulphide (KONOWALOFF and PLOTNIKOFF), A., i, 323.
- Bronzes from Ephesus**, composition of (NATTERER), A., ii, 480.
- analysis of (FOMIN), A., ii, 109.
- Bullocks**. See Agricultural Chemistry.
- Burette for gas analysis** (WHITE), A., ii, 571.
- Burettes**, use of floats in (KREITLING), A., ii, 685.
- isoButaldazine** (*bisisopropylazimethylene*), transformation of, into 4:4-dimethyl-5-isopropylpyrazoline (FRANKE), A., i, 212.
- isoButaldehyde** and formaldehyde, an aldol from (WESSELY), A., i, 428.
- condensation of, with acetone (FRANKE and KOHN), A., i, 206.
- condensation of, with furfuraldehyde (LINDAUER), A., i, 305.
- condensation of, with glyoxal (v. HORNPOSTEL and SIEBNER), A., i, 206.
- isoButaldehyde**, α -bromo- (2-methyl-2-bromopropional) (FRANKE), A., i, 428.
- p*- α -bromo- (mono- and tri-meric) (FRANKE), A., i, 427.
- isoButane**, dinitro-, and its potassium derivative (PONZIO), A., i, 588.
- Butanedicarboxylic acids**. See:—
- Adipic acid.
- Dimethylsuccinnic acid.
- Methylglutaric acid.
- Propylmalonic acid.
- cycloButanedicarboxylic acid** (*cis-tetramethylene-1:3-dicarboxylic acid*), formation of (BOTTOMLEY and PERKIN), T., 306; P., 1900, 16.
- Butanetetra-carboxylic acid**, α -*di*-bromo-, ethyl ester (LEAN), T., 103; P., 1899, 197.
- Butanol mercury salts** and **Butene-mercury iodide** (SAND and HOFMANN), A., i, 386.
- Butinene α -*di*-bromide** (THIELE), A., i, 2.
- Butter**, rancidity of (BROWNE), A., ii, 115; (HANUS), A., ii, 634.
- detection of normal and "renovated" (HUMMEL), A., ii, 582.
- detection of "process" or "renovated" (HESS and DOOLITTLE), A., ii, 452.
- analysis of (RICHMOND), A., ii, 696.
- and its substitutes, analysis of (INDEMAN), A., ii, 115.
- refractometric value of (LAM), A., ii, 634.
- analysis of, refractometrically (PARTHEIL and v. VEISEN), A., ii, 633.
- detection of cotton-seed oil in (VAN ENGELEN; SOLTSIEN), A., ii, 116; (STRYZOWSKI), A., ii, 325.
- detection of sesame oil in (WEIGMANN), A., ii, 40; (SOHN), A., ii, 55; (KERP), A., ii, 116; (BREMER; SOLTSIEN), A., ii, 325; (AMTHOR), A., ii, 453.
- estimation of the volatile acids in, by Leffmann-Beam's glycerol-soda process (SEYDA), A., ii, 772.
- errors in the estimation of insoluble fatty acids in (MAINSBRECQ), A., ii, 114.
- estimation of fat in, by Gerber's process (WERDER), A., ii, 252.
- the Reichert number of fat in (STEBINS), A., ii, 55.
- See also Agricultural Chemistry.
- n-Butyl isocyanide** (WADE), P., 1900, 157.
- isoButyl nitrite**, action of ethyl alcohol and alcoholic hydrogen chloride on (KISSEL), A., i, 621.
- phosphates and their lead and barium salts (CAVALIER and PROST), A., i, 579.
- tert. Butyl isocyanide** (NER), A., i, 4.

*iso*Butylbenzene, preparation and properties of (PERKIN), T., 288; P., 1899, 237.

*sec.*Butylbenzene and its *p*-sulphonic acid (ESTREICHER), A., i, 213.

4-*tert.*Butylcoumarone (STOERMER), A., i, 653.

Butyleytisine platinichloride, *iso*- and *sec.*- (LITTERScheid), A., i, 513.

Butylene, action of, on mercuric salts (SAND and HOFMANN), A., i, 385.

Butylenedicarboxylic acid. See Dimethylfumaric acid.

*iso*Butylideneacetone, its oxime and acetyl derivative (FRANKE and KOHN), A., i, 206.

*p-sec.*Butylphenol and its acetyl derivative (ESTREICHER), A., i, 213.

5-Butylisophthalic acid, 2-nitro- (BAUR-THURGAU), A., i, 640.

Butyltoluenes. See Methylbutylbenzenes.

Butyltoluic acid, *dinitro*- (BAUR-THURGAU), A., i, 640.

5-Butyl-*p*-toluic acid (BAUR-THURGAU), A., i, 640.

Butylxylene (1:3-*dimethyl-5-butylbenzene*), and its derivatives (BAUR-THURGAU), A., i, 639.

Butylxylidine ($\text{Me}_2\text{C}_4\text{H}_9\text{NH}_2=1:3:5:2$), and its benzylidene and acyl derivatives, salts, and 4-*mono* and 4:6-*dinitro*- and their acetyl derivatives (BAUR-THURGAU), A., i, 639.

($\text{Me}_2\text{C}_4\text{H}_9\text{NH}_2=1:3:5:4$), and its salts and benzoyl derivative (BAUR-THURGAU), A., i, 640.

Butylxylid cyanide, and its *dinitro*-derivative ("cyanide musk"), structure of (BAUR-THURGAU), A., i, 640.

Butylxylaldehyde and its oxime (BAUR-THURGAU and BISCHLER), A., i, 178; (BAUR-THURGAU), A., i, 640.

Butylxylid methyl ketone, structure of (BAUR-THURGAU), A., i, 640.

*iso*Butyralacetone and its oxime (FRANKE and KOHN), A., i, 207.

Butyric acid, α -amino- (v. GULEWITSCH), A., i, 476.

d- and *l*- α -amino-, and their hydrochlorides (FISCHER and MOUNEY-RAT), A., i, 648.

γ -amino-, and its salts (TAFEL and STERN), A., i, 557.

β - and γ -chloro-, preparation of, and action of water on (DE BARR), A., i, 76.

γ -cyano- (DIECKMANN), A., i, 297.

*iso*Butyric acid, *o*-nitrophenyl ester (BISCHOFF), A., i, 442.

*iso*Butyric acid, α -bromo-, ethyl ester, condensation of, with ethyl malonates and ethyl cyanoacetates (LAWRENCE), P., 1900, 154.

α -iodo- (ZERNOFF), A., i, 328.

Butyric acids, *n*- and *iso*-, density of (v. HIRSCH), A., ii, 9.

α -thiocyano-, esters of, formation and boiling points of (WHEELER and BARNES), A., i, 565.

estimation of, in acetic acid (MUSPRATT), A., ii, 375.

separation of, from lactic and valeric acids (SCHNEIDER), A., ii, 177.

*p-iso*Butyroxyl- ψ -cumyl, and -mesityl ethyl ether and bromide, *di*bromo- (AUWERS, TRAUN, and WELDE), A., i, 169.

p-n-Butyryl-acetanilide, and -aniline (KUNCKELL), A., i, 665.

*iso*Butyrylactic and Butyrylacetacetic acids, ethyl esters, and *iso*Butyryl-acetone, synthesis of (BOUVEAULT), A., i, 474.

Butyryl-*o*-flavaniline (CAMPS), A., i, 310.

C.

Cacodylic acid, heat of neutralisation and acidimetry of (IMBERT), A., i, 145.

sodium salt, elimination of, in urine, after ingestion (IMBERT and BADEL), A., ii, 293.

estimation of, volumetrically (IMBERT and ASTRUC), A., ii, 122.

Cadinene from West Indian sandalwood oil (DEUSSEN), A., ii, 579.

nitroso-derivatives of (SCHREINER and KREMER), A., i, 106.

Cadmium, colloidal (BREDIG), A., ii, 278.

boiling point of (BERTHELOT), A., ii, 654.

Cadmium alloys with platinum (HODGKINSON, WARING, and DEBOROUGH), A., ii, 282.

with sodium, composition and melting point of (KURNAKOFF), A., ii, 277.

Cadmium amalgam (KERF and BÖTTGER), A., ii, 656.

Cadmium orthoborate (OUVRARD), A., ii, 206.

haloids, compounds of, with the methylamines and tetramethylammonium (RAGLAND), A., i, 141.

hydroxide, equilibrium in the partition of an acid between ammonia and (HERZ), A., ii, 532.

iodide, combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1246; P., 1900, 173.

trihydrated acid (DOBROSERDOFF), A., ii, 654.

- Cadmium ammonium phosphate**, estimation of cadmium in (AUSTIN), A., ii, 49.
- selenide, dimorphism of (FONZES-DIACON), A., ii, 346.
- ferrous sulphates, solubility of (STORTENBEKER), A., ii, 530.
- vanadinites, production of (DE SCHULTEN), A., ii, 346.
- Cadmium organic compounds**:—
- ferrocyanide (MILLER and FISHER), A., ii, 761.

- estimation of, electrolytically (BALACHOWSKI), A., ii, 688.
- estimation of, gravimetrically (HESS), A., ii, 688.
- estimation of, in cadmium ammonium phosphate (AUSTIN), A., ii, 49.
- estimation of, in zinc (MACKAY), A., ii, 49.
- Cæsium**, preparation of, from the carbonate (GRAEFE and ECKARDT), A., ii, 75.
- physical properties of (ECKARDT and GRAEFE), A., ii, 479.
- Cæsium salts**, extraction of, from lepidolite (FORMÁNEK), A., ii, 15.
- Cæsium chloride**, compound of, with manganese chloride (MEYER and BEST), A., ii, 77.
- fluoroperoxide and hydrogen tetrafluoriodate (WEINLAND and KÜPPEN), A., ii, 139.
- persulphate (KURNAKOFF), A., ii, 277.
- Cæsium, detection of**:—
- microchemical detection of (HUYSE), A., ii, 245.
- Caffeine**, electrolytic reduction of (TAFEL), A., ii, 588.
- action of iodine on (KIPPENBERGER), A., ii, 777.
- action of, on the heart (BOCK), A., ii, 424.
- decomposition of, in the organism (KRÜGER), A., ii, 30, 93.
- influence of, on the output of alkalis in the urine (KATSUYAMA, KUWAHARA, and SENO), A., ii, 94.
- delicate test for (ARCHETTI), A., ii, 121.
- Caffeineazo-compounds** (GOMBERG), A., i, 264.
- Cakes, feeding**. See Agricultural Chemistry.
- Calcite and aragonite**, physicochemical relations of (FOOTE), A., ii, 541.
- Calcium and its compounds** (MOISSAN), A., ii, 76.
- metabolism of (LEIPZIGER), A., ii, 223.
- Calcium salts**, solubility of, in sucrose solutions (STOLLE), A., i, 333.
- Calcium salts**, colour reactions for detecting, in organic tissues (GRANDIS and MAININI), A., ii, 625.
- Calcium aluminates** (ALLEN and ROGERS), A., ii, 727; (DUPAU), A., ii, 728.
- boride, formation of (GEELMUYDEN), A., ii, 344.
- bromide, electrolysis of solutions of (SARGHEL), A., ii, 401.
- carbide, commercial (MOISSAN), A., ii, 15.
- action of amyl chloride on (LEFEBVRE), A., i, 323.
- reducing action of (GEELMUYDEN), A., ii, 344.
- analysis of (ERDMANN and V. UNRUH; MAGNANINI and VAN NINI), A., ii, 511.
- carbonate, solubility of, in sea water (COHEN and RAKEN), A., ii, 725.
- action of, on phosphoric acid (SCHLÖSING), A., ii, 541, 618.
- estimation of, in marls (NOLL), A., ii, 48.
- chloride, combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1249; P., 1900, 173.
- hydroxide, action of, on germination (WINDISCH), A., ii, 614.
- oxide (in three forms), solubility of, in sugar solutions (WEISBERG), A., i, 628.
- oxide (*lime*), action of hydrogen peroxide on (DE FORCRAND), A., ii, 526.
- See also Agricultural Chemistry.
- peroxide, heat of formation of (DE FORCRAND), A., ii, 526.
- anhydrous, and the constitution of its hydrates (DE FORCRAND), A., ii, 479.
- peroxides, hydrated (DE FORCRAND), A., ii, 401.
- phosphate, preparation of (PRUNIER and JOUYE), A., ii, 140.
- Tricalcium phosphate**, solubility of, in natural waters in presence of carbonic acid (SCHLÖSING), A., ii, 541, 618.
- Calcium phosphates**. See also Agricultural Chemistry.
- orthoplumbate* and *perplumbate* (KASNER), A., ii, 725.
- sulphate, hydrates of (VAN'T HOFF and ARMSTRONG), A., ii, 531.
- See also Gypsum.
- hydroximidiosulphate, production of (DIVERS and HAGA), T., 690; P., 1900, 71.

- Calcium, detection, estimation, and separation of:—**
 detection of barium, strontium, and (DUMESNIL), A., ii, 625.
 estimation of, by the citrate method (PASSON), A., ii, 246.
 estimation of, in presence of aluminium and iron (BLUM), A., ii, 511.
 estimation of, photometrically, in limestone (HINDS), A., ii, 575.
 separation of barium, strontium, and (KÜSTER), A., ii, 108.
- Calorimeter, a new coal (PARR), A., ii, 710.**
 Bunsen's ice (MELLOR), A., ii, 334.
Calves. See Agricultural Chemistry.
- 2-Camphanamine, chloro- (DUDEN and MACINTYRE), A., i, 302, 674.**
- Camphane, 1-nitro-, ψ -nitro- and its potassium and benzoyl derivatives, 1:1-bromonitro-, 1:1-chloronitro-, and 1:1-iodonitro- (FORSTER), T., 251; P., 1900, 13.**
- i*-Camphane (ASCHAN), A., i, 399.**
- Camphanic acid, isomeride of (PERKIN and THORPE), P., 1900, 152.**
- Camphenamine, the vinylamine constitution of, and the action of methyl iodide and benzaldehyde on (DUDEN and MACINTYRE), A., i, 302.**
 and the action of nitrous acid on it and its salts (DUDEN and MACINTYRE), A., i, 674.
- Camphene (WAGNER and BRICKNER), A., i, 47, 554.**
 from borneol (SEMMLER), A., i, 351; (KONOWALOFF), A., i, 352.
 constitution of, and action of fuming nitric acid on (BOUVEAULT), A., i, 508.
- Camphenepyrroles, synthesis of (DUDEN and TREFF), A., i, 671.**
- Camphenilaldehyde and *n*- and *iso*-Camphenilanic acids (BREDT and JAGELKI), A., i, 134.**
- iso*-Camphenone, constitution of (RIMINI), A., i, 554.**
- Camphenylone and its oximes (BLAISE and BLANC), A., i, 183.**
- Campherimine, decomposition products of (MAHLA and TIEMANN), A., i, 507.**
- ψ -Campholactone and its isomeride (LEES and PERKIN), P., 1900, 18.**
- Campholene, α -amino- (BLANC), A., i, 581.**
- Campholic acid, and bromo-, synthesis of, by means of camphoric acid (v. BAEYER and VILLIGER), A., i, 133; (HALLER and BLANC), A., i, 202.**
- Campholide (v. BAEYER and VILLIGER), A., i, 133.**
- Campholide, α -bromo-, its formula and hydrolysis (LAPWORTH and CHAPMAN), T., 446; P., 1900, 56.**
*di*bromo- (LAPWORTH and CHAPMAN), T., 310; P., 1900, 4.
- Campholytic acid and its stereoisomeride, reactions and structure of (WALKER and CORMACK), T., 374; P., 1900, 58.**
 constitution of (BLANC), A., i, 581; (NOYES and PHILLIPS), A., i, 622.
- Camphonic acid, its oxime, semicarbazone, and phenylhydrazones, and action of bromine and of hydrogen cyanide on (LAPWORTH and CHAPMAN), T., 446; P., 1900, 56.**
- Camphonolactone, *mono*- and *tri*-bromo- (LAPWORTH and CHAPMAN), T., 446; P., 1900, 56.**
- Camphononic acid, formation of (LAPWORTH), T., 1070.**
 action of bromine and hydrogen cyanide on, and its oxime (LAPWORTH and CHAPMAN), T., 452; P., 1900, 57.
- Camphopyric acid and anhydride, bromo-derivatives of (GARDNER), P., 1900, 46.**
- Camphor, constitution of (LAPWORTH), T., 1053; P., 1900, 128; (BOUVEAULT), A., i, 182.**
 vapour pressure of (ALLEN), T., 413; P., 1899, 413.
 solubility of, in hydrochloric and hydriodic acids (ZAHARIA), A., i, 106.
 oxidation of, by an alkali ferricyanide (ETARD), A., i, 301.
 aromatic compounds of, molecular refraction and dispersion, and specific rotation of (HALLER and MÜLLER), A., i, 182.
 derivatives, molecular volume of (HALLER and MÜLLER), A., ii, 193.
 spirit of, valuation of (PARTHEIL and VAN HAAREN), A., i, 507.
 estimation of, polarimetrically, in camphorated oil (LEONARD and SMITH), A., ii, 699.
- Camphor, α -*di*bromo-, action of fuming nitric acid on (LAPWORTH and CHAPMAN), T., 309; P., 1900, 4.**
 $\alpha\alpha'$ -bromonitro- (LAPWORTH and CHAPMAN), T., 310; P., 1900, 4.
 cyano-, and its chloro- and bromo-derivatives and their hydrolysis (LAPWORTH), T., 1053; P., 1900, 128.

- isocarbostryl**, and the formation of its derivatives (GABRIEL and COLMAN), A., i, 358.
- Carboxylaminophenols**, dibromo- (VAN DAM), A., i, 171.
- α -Carboxyphenoxy-propionic**, *n*- and *iso*-butyric, and *isovaleric* acids, *m*- and *p*-, and their ethyl esters (BISCHOFF), A., i, 397.
- α -Carboxyphenylglycollic acid**, anilide, phenetide, and aniside of (COHN), A., i, 93.
- Carmin**, α - and β -bromo-, and **Carminic acid** and its derivatives (LIEBERMANN, HÜRING, and WIEDERMANN), A., i, 236.
- Carnallite**, equilibrium relations of (VAN'T HOFF and MEYERHOFFER), A., ii, 12.
- Carnallites**, production of substituted (DE SCHULTEN), A., ii, 343.
- Carnosine** from meat extract (v. GULEWITSCH and AMIRADŽIĆ), A., i, 516.
- Carnotite** from West Colorado (HILLEBRAND and RANSOME), A., ii, 599.
- Carob bean seeds**, enzyme of (BOURQUELOT and HÉRISSEY), A., i, 320; ii, 35, 233.
- Caro's acid** or **Caro's reagent** (BACH), A., ii, 470; (BAMBERGER), A., ii, 536.
 preparation of, and action of permanganate on (v. BAEYER and VILLIGER), A., ii, 719.
 oxidation of aliphatic amines, and of aromatic iodides by (BAMBERGER and HILL), A., i, 281.
 action of, on furfuraldehyde (CROSS, BEVAN, and BRIGGS), A., i, 682.
 action of, on ketones (v. BAEYER and VILLIGER), A., i, 133, 206, 328, 627.
 action of, on oximes (BAMBERGER), A., i, 500.
 See also Persulphuric acids under Sulphur.
- Carpaine**, action of phenylthiocarbimide on (LITTSCHNEID), A., i, 516.
- Carpic acid**, bromo- (PINNER and KOHLHAMMER), A., i, 456.
- Carthamus tinctorius***, oil of (*safflower oil*) (LE SUEUR), A., ii, 362.
- Cartilage**, fat in (SACERDOTTI), A., ii, 291.
 sodium in (v. BUNGE), A., ii, 92.
 of the shark, composition of (v. BUNGE), A., ii, 29.
- Carvacrol**, sodium derivative, compounds of, with the ethyl esters of α -bromo- fatty acids (BISCHOFF), A., i, 394.
 bromo- and chloro-amino-, diacetyl derivatives of (KEHRMANN and SCHOEN), A., i, 181.
- α -Carvacroxy-propionic**, *n*- and *iso*-butyric, and *isovaleric* acids and their ethyl esters (BISCHOFF), A., i, 394.
- Carvacryl-acetal**, and *acetaldehyde* and its semicarbazone (STOERMER), A., i, 653.
- Carvenone** from dihydrocarvone (KONDAKOFF and LUTSCHININ), A., i, 104; (KLAGES), A., i, 239.
- Carvomenthene** and **Carvomenthol** and their derivatives (KONDAKOFF and LUTSCHININ), A., i, 104.
- Carvone**, conversion of, into limonene (TSCHUGAEFF), A., i, 352.
 dichloride and its reactions (KLAGES and KRAITH), A., i, 43.

Carvone, estimation of, in volatile oils (LABBÉ), A., i, 398; (ALDEN and NOLTE), A., ii, 117; (ALDEN and EHLERT), A., ii, 631.

Carvones, ψ - and σ -, formulæ of (SEMMER), A., i, 453.

Carvonedihydrodisulphonic acid (LABBÉ), A., i, 398.

Carvotanacetone, constitution of (SEMMER), A., i, 676.

α -Carvoxime, nature of (ROOZEBOOM), A., i, 240.

Caryophyllene and its nitroso-derivatives (SCHREINER and KREMERS), A., i, 106.

Cascarilla oil, constituents of (THOMS), A., i, 622.

Cascarillic acid and its amide, and the action of nitric acid on (THOMS), A., i, 622.

Casein, decomposition of, by sulphuric acid (KUTSCHER), A., i, 67.

Caseinogen of human milk (KOBRAK), A., ii, 420.

Cassiterite from Banca and Billiton (BECK), A., ii, 734.

analysis of (MENNICKE), A., ii, 761.

Cat, nitrogenous metabolism in the (MENDEL and BROWN), A., ii, 151.

Catalysis. See Affinity, chemical.

Catechobis- α -oxy-propionic, n - and \textit{iso} -butyric, and $\textit{isovaleric}$ acids, their ethyl esters and lactones (BISCHOFF), A., i, 445.

Catecho-mono- and bis-oxypropionyl-p-phenetides (BISCHOFF), A., i, 445.

Catechol (*pyrocatechol*: 1:2-dihydroxybenzene), action of picryl chloride on (HILLYER), A., i, 289.

condensation of the disodium derivative of, with esters of α -bromo-fatty acids (BISCHOFF), A., i, 445.

derivatives (MOUREU), A., i, 99.

Catechol-acetanilide, -methylanilide, -piperidide, -phenylhydrazide, and -p-toluidide (LUDEWIG), A., i, 444.

Catecholacetic acid (α -hydroxyphen-oxyacetic acid), and its ethyl ester, anhydride and anilide (CARTER and LAWRENCE), T., 1222; P., 1900, 152.

and its esters and anhydride, and acetyl and bromo- and nitro-derivatives (LUDEWIG), A., i, 444.

Catecholcarbobenzylisoamylamine (EINHORN and PFEIFFER), A., i, 222.

Cattle. See Agricultural Chemistry.

Ceanothus americanus, alkaloids of (GORDIN), A., i, 683.

Cedron, $\text{C}_{16}\text{H}_{18}\text{O}_4$ or $\text{C}_{14}\text{H}_{16}\text{O}_5$, its acetyl derivative and methyl ether (ČRČELSKY), A., i, 225.

Celadonite from Moravia (KOVÁK), A., ii, 149.

Celestite from Baltschiederthal, Switzerland (SCHMIDT), A., ii, 217.

Cells, galvanic. See Electrochemistry.

Cellulose, does, occur in the shield of Sepia? (SCHULZ), A., ii, 292.

molecular weight of (NASTUKOFF), A., i, 540.

specific heat of (FLEURY), A., ii, 188.

fermentation of (OMELIANSKY), A., ii, 493.

enzymes (NEWCOMBE), A., ii, 99.

acetyl derivatives of (FRANCHIMONT), A., i, 141; (VIGNON and GERIN), A., i, 629.

nitrates (LUCK and CROSS), A., i, 541; (VIGNON), A., i, 589.

reduction of (VIGNON), A., i, 629.

estimation of (BECK; KÖNIG), A., ii, 448; (COUNCLER), A., ii, 630.

estimation of, in feces (MANN), A., ii, 250.

estimation of, in plants (KLEIBER), A., ii, 630.

Cell-wall constituents, estimation of, in plants (KLEIBER), A., ii, 630.

Cements, change of volume of, during hydration (LE CHATELIER), A., ii, 140.

testing of (KLEIN and PECKHAM), A., ii, 627.

Cereals. See Agricultural Chemistry.

Cerebrin (*phrenosin*), reactions of (THURDICHUM), A., i, 319.

Cerebro-spinal fluid, composition of (PANZER), A., ii, 152.

absence of cholinein (v. GULEWITSCH), A., ii, 420.

Cerite metals, preparation of the sulphur, bromine and chlorine compounds of (MUTHMANN and STÜTZEL), A., ii, 142.

See also Earths, rare.

Cerium salts, oxidation of, in alkaline solution (JOB), A., ii, 657.

Cerium, double nitrates of quadrivalent (MEYER and JACOBY), A., ii, 597.

oxide (*ceria*), luminosity of mixtures of thoria and (THIELE), A., ii, 208.

sulphates (MUTHMANN and STÜTZEL), A., ii, 544.

estimation of (BROWNING), A., ii, 170; (v. KNORRE), A., ii, 576.

separation of, from the cerite earths (WITT and THEEL), A., ii, 403.

Cerussite from the Altai (v. JEREMÉEFF), A., ii, 354.

Cetipic acid (*oxalidacetic acid*), ethyl ester, action of hydrocyanic acid on (THOMAS-MAMERT and WEIL), A., i, 427.

- Cetipic acid** (*oxalodiacetic acid*), ethyl ester, condensation of, with ethylene-diamine and naphthylene-*o*-diamines (THOMAS-MAMERT and WEIL), A., i, 459.
- Cetyleytisine** (RAUWERDA), A., i, 608, 684.
- Chabasite** from North Carolina (PRATT), A., ii, 24.
from Sardinia, and from the granulites of Striegau (RIMATORI), A., ii, 735.
- Chalcocamprite** from Greenland (FLINK), A., ii, 412.
- Champagne**, analyses of modern "dry" (ROSENHEIM and SCHIDROWITZ), A., ii, 372.
- Change**, permanent, and thermodynamics (DUHEM), A., ii, 524, 708.
- Cheese**. See Agricultural Chemistry.
- Cheiranthin** and **Cheirinine** from wall-flower (REEB), A., i, 186.
- Chelerythrine** (MERRILL and SCHLOTTERBECK), A., i, 686.
- Chemical action**. See Affinity.
constitution and composition in relation to density (KANONNIKOFF), A., ii, 184.
and fluorescence (HEWITT and PERKINS), T., 1324; P., 1900, 178; (HEWITT), P., 1900, 3; A., ii, 518.
and physiological action, relation between (PADERI), A., ii, 742.
kinetics (RAMBERG), A., ii, 717.
gaseous reactions in (BODENSTEIN), A., ii, 12.
and free energy of the reaction $2\text{HI} + 2\text{Ag} \rightleftharpoons 2\text{AgI} + \text{H}_2$ (DANNEKE), A., ii, 467.
- Chemistry**, progress of, in Great Britain and Ireland during the 19th century (THORPE), T., 562.
- Chicory**, constituents of (WOLFF), A., ii, 37.
- Chitosamine**. See Glucosamine.
- Chloral**, boiling points of mixtures of water and (CHRISTENSEN), A., i, 626.
action of, on the chloroacetic acids (GABUTTI), A., i, 370.
compound of, with benzylquinaldine (KORNIGS), A., i, 189.
- Chloral alcoholate**, estimation of (SCHMIDINGER), A., ii, 327.
- Chloral hydrate**, physico-chemical properties of (MAUCH), A., ii, 454.
melting point of (WOLF), A., i, 274.
action of, on hemoglobin (FORMÁNEK), A., i, 532.
use of, in estimating alkaloids (SCHAER), A., ii, 57.
estimation of, in organs (RUSSWURM), A., ii, 121.
- Chloral hydrate**, estimation of chloroform and, in toxicological analysis (KIPPENBERGER), A., ii, 581.
- Chlorella vulgaris**, culture of (RADAIS), A., ii, 362.
- Chlorotone**. See Acetonechloroform.
- Chlorine**, evolution of, from chlorates (SODEAU), T., 137, 717; P., 1899, 157; 1900, 88.
amount of, in rain-water collected at Cirencester (KINCH), T., 1271; P., 1900, 183.
spectrum of (EDER and VALENTA), A., ii, 72.
ions, the discharge potential of (MÜLLER), A., ii, 643.
liquid, some properties of (LANGE), A., ii, 649.
colour of solutions of (SARLES), A., ii, 72.
action of, on metallic silver in the light and in the dark (v. CORDIER), A., ii, 343, 723.
nascent, action of, on sulphonic groups in naphthalene derivatives (VAUDEL), A., i, 544.
- Hydrochloric acid** (*hydrogen chloride*), effect of concentration on the magnetic rotation of solutions of (FORCHHEIMER), A., ii, 524.
and sulphuric acid, conductivity of aqueous solutions of (BARNES), A., ii, 522.
dissociation and dissociation equilibrium of (JAHN), A., ii, 522.
dissociation constant of, dissolved in mixtures of organic solvents and water (MORELLO), A., ii, 395.
reversible reaction between silver and (JOUNIAUX), A., ii, 139.
absorption of, from aqueous solution, by colloidal stannic oxide (VAN BEMMELEN and KLOBBIE), A., ii, 338; (VAN BEMMELEN), A., ii, 466.
formation of, in the stomach (WESNER), A., ii, 92.
estimation of, in the presence of chlorates and perchlorates (BLATTNER and BRASSEUR), A., ii, 755.
combined, estimation of (COHNHEIM and KRIEGER), A., ii, 778.
estimation of, in gastric juice (COHNHEIM and KRIEGER), A., ii, 508.
- Chloride of lime**. See Bleaching powder.
- Chlorates**, electrolytic formation of (FOERSTER), A., ii, 72, 400; (MÜLLER), A., ii, 73; (BROCHET), A., ii, 205, 276, 541, 700; (FOERSTER and JORRE), A., ii, 343; (WOLF), A., ii, 382; (SIE-

Chlorine:—

VERTS), A., ii, 470; (WOHLWILL), A., ii, 400, 471; (LORENZ and WEHRLIN), A., ii, 476; (FOERSTER and SONNEBORN), A., ii, 645.

Chlorates, decomposition of (SODEAU), T., 137, 717; P., 1899, 157; 1900, 88.

estimation of, in the presence of chlorides and perchlorates (BLATTNER and BRASSEUR), A., ii, 755.

mixtures of hypochlorites and, iodometric estimation of (DITZ and KNÖPFELMACHER), A., ii, 241.

Hypochlorous acid, action of, on unsaturated acids (MELIKOFF), A., i, 536.

action of, on primary aromatic amines (MEIGEN and NORMANN), A., i, 702.

action of, on tertiary amines (WILLSTÄTTER and IGLAUER), A., i, 458.

action of, on anilides (CHATTAWAY and ORTON), T., 134, 789, 797; P., 1899, 232; P., 1900, 102, 112; (CHATTAWAY, ORTON, and HURTLEY), T., 800; P., 1900, 125; (ARMSTRONG), T., 1047; P., 1900, 160.

action of, on diacetyl- and dibenzoyl-*m*-phenylenediamine (MORGAN), T., 1208; P., 1900, 170.

Hypochlorites, electrolytic formation of (FOERSTER), A., ii, 72, 400; (MÜLLER), A., ii, 78; (BROCHET), A., ii, 205, 276, 541; (FOERSTER and JORRE), A., ii, 343; (WOHLWILL), A., ii, 400, 471; (SIEVERTS), A., ii, 470; (LORENZ and WEHRLIN), A., ii, 476; (FOERSTER and SONNEBORN), A., ii, 645.

electrolysis of solutions of (BROCHET), A., ii, 594, 706.

Perchloric acid, preparation of (MICHAEL and CONN), A., ii, 471.

anhydrous, preparation and properties of (VORLÄNDER and v. SCHILLING), A., ii, 340.

estimation of, in the presence of chlorates and chlorides (BLATTNER and BRASSEUR), A., ii, 755.

Perchlorate in sodium nitrate, injurious effect of, on the growth of sugar beet (STOKLASA), A., ii, 305.

Chlorine monoxide, action of, on benzene (SCHOLL and NÜRR), A., i, 337.

heptoxide (MICHAEL and CONN), A., ii, 471.

Chlorine, estimation and separation of:—

estimation of, in bleaching powder (WOŁOWSKI), A., ii, 165.

Chlorine, estimation and separation of:—

estimation of, in presence of bromine and iodine (v. WESZELSZKY), A., ii, 436.

estimation of, in gastric juice (MEILLERE), A., ii, 509.

separation of, from bromine and iodine (CROTOGINO), A., ii, 642.

separation of, from iodine (VANINO and HAUSER), A., ii, 165.

Chloroform, boiling point of, with mixtures of benzene (HAYWOOD), A., ii, 64.

action of, on alkaloid salts (HILL; SCHAEER), A., ii, 455.

action of, on dimethylpyrrolines (BOCCHI), A., i, 357.

action of, on hæmoglobin (FORMÁNEK), A., i, 532.

non-elimination of, after inhalation (VITALI), A., ii, 31.

estimation of chloral hydrate and, in toxicological analysis (KIPPENBERGER), A., ii, 581.

Chloroglobin, the colouring matter of leaves (TSVETI), A., i, 50.

Chlorophyll. See Agricultural Chemistry.

Cholesterol, reduction of, to coprosterol in the intestine (MÜLLER), A., ii, 289.

detection of, in fats (KREIS and RUDIN), A., ii, 252.

Choline in the suprarenal gland (HUNT), A., ii, 295.

absence of, in cerebro-spinal fluid (v. GULEWITSCH), A., ii, 420.

Chrome alum, nature of the change from violet to green in solutions of (WHITNEY), A., ii, 211; (VENABLE), A., ii, 349.

Chrome steel, analysis of (M'KENNA), A., ii, 765.

estimation of phosphorus in (IBBOTSON and BREARLEY), A., ii, 757.

Chromite (*chrome iron ore*) from Newfoundland (MAYNARD), A., ii, 86.

simple method of decomposing (FIEBER), A., ii, 512.

analysis of, by the borax method (MACIVOR), A., ii, 765.

estimation of silica in (TATE), A., ii, 313.

Chromium in plants (DEMARÇAY), A., ii, 235.

electro-deposition of (COWPER-COLES), A., ii, 408.

electromotive behaviour of (HITTORF), A., ii, 127; (MORGAN and DUFF), A., ii, 539.

behaviour of, towards acids (OSTWALD), A., ii, 730.

- Chromium salts**, hydrolysis of (RICHTARDS), A., ii, 472.
 action of sodium thiosulphate on (FAKTOR), A., ii, 691.
- Chromium azoimide**, basic (CURTIUS and DARAPSKY), A., ii, 474.
 phosphide, preparation of (MARONNEAU), A., ii, 281.
 potassium and sodium sulphates (PAGEL), A., ii, 349.
- Chromous salts**, oxidation of, by atmospheric oxygen (MANCHOT and HERZOG), A., ii, 546.
 oxide, double carbonates of (BAGGÉ), A., ii, 349.
 ammonium sulphate (LAURENT), A., ii, 547.
- Chromic acid**, recovery of, from chromium residues (REGELSBERGER), A., ii, 79.
 estimation of, volumetrically, by arsenious acid (REICHARD), A., ii, 691.
 estimation of, in solutions for purifying acetylene (ULLMANN and GOLDBERG), A., i, 1.
- Chromates**, alkali, detection of, in milk (LEYS), A., ii, 110.
- Chromium organic compounds** :—
- Chromium salts**, compounds of, with pyridine, triethylenediamine and tripropylenediamine (PFEIFFER), A., i, 559.
- Chlorochromic acid**, pyridine and quinoline salts of (MEYER and BEST), A., ii, 79.
- hexa*-**Chlorotrichromyl chloride**, pyridine salt of (MEYER and BEST), A., ii, 79.
- Chromium**, estimation and separation of :—
 estimation of, in iron and steel (DÖHLER; MAHON), A., ii, 110.
 separation of, from iron (HAVENS and WAY), A., ii, 50.
- "Chromone"** (*pheno- γ -pyrone*) (BLOCH and V. KOSTANECKI), A., i, 308.
- Chromyl dichloride**, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 75.
 action of nitric oxide on (THOMAS), A., ii, 144.
- Chrysanthemum japonicum*, oil of (PERRIER), A., i, 352.
- Chrysarobin** and its acetyl derivatives (HESSE), A., i, 41.
 oxidation products of (MARFORI), A., i, 553.
- Chrysean**, its acetyl derivative and its condensation with aldehydes (HELLSING), A., i, 518.
- Chrysenic acid** (GRAEBE and HÖNIGSBERGER), A., i, 506.
- Chrysenic acids**, constitution of (GRAEBE), A., i, 296.
- Chrysoidine** hydrochloride, bromo- and chloro- (MORGAN), T., 1205; P., 1900, 170.
- Chrysoidinesulphonic acid**, chloro- and bromo-, potassium salts of (MORGAN), T., 1205.
- Chrysoketone** and its carboxylic acid (GRAEBE and HÖNIGSBERGER), A., i, 505.
- Chrysophanic acid** (*dihydroxymethyl-anthraquinone*) and its acetyl derivatives (HESSE), A., i, 40; (LIEBERMANN), A., i, 355.
 isomeric forms of (MARFORI), A., i, 553.
- Chrysophanohydroanthrone** and its diacetyl derivative (HESSE), A., i, 42.
- Chrysoquinone** and its oxidation products, and its oxime and acids (GRAEBE and HÖNIGSBERGER), A., i, 505.
- Chrysotile**, composition of (VAN DER BELLEN), A., ii, 603.
- Chymosin** and **Parachymosin** (BANG), A., ii, 356.
- Chyle**, human (PANZER), A., ii, 672.
 composition of the fat of (ERBEN), A., ii, 739.
- Cider** and **Cider vinegar**, analysis of solids and ash of (DOOLITTLE and HESS), A., ii, 450.
- Cigars**, estimation of nicotine in (THOMAS), A., ii, 428.
- apo***Cinchonine**, its constitution and its nitro- and amino-derivatives and their ethers (KOENIGS), A., i, 245.
- Cinchomeronic acid**, esterification of (KIRPAL), A., i, 51.
- Cinchona alkaloids**, conversion of, into 4-phenylquinoline derivatives (KOENIGS), A., i, 245.
- α - and β -*iso*- ψ -**Cinchonicine** and their compounds (SKRAUP), A., i, 605; (SKRAUP and ZWERRER), A., i, 606.
- Cinchonine** and its compounds (SKRAUP and ZWERRER), A., i, 606.
 molecular transformation of (WEGSCHEIDER), A., ii, 532.
- α - and β -*iso***Cinchonine** and their compounds (SKRAUP and ZWERRER), A., i, 606.
- β -*iso***Cinchonine**, constitution of, and its compounds (SKRAUP), A., i, 605.
- allo***Cinchonine sulphate** (SKRAUP and ZWERRER), A., i, 606.
- Cinder**, blast-furnace, estimation of alumina as phosphate in (CAMP), A., ii, 763.

- Cinenic acid** and its esters and **Cineolic acid** (RUPE), A., i, 371.
- Cinnamal.** See **Cinnamylidene**.
- Cinnamaldehydephenylhydrasone**, oxidation of (MINUNNI and ORTOLEVA), A., i, 260.
- Cinnamene**. See **Styrene**.
- Cinnamhydroxamic acid** and its acetyl and benzoyl derivatives (THIELE and PICKARD), A., i, 29.
- Cinnamic acid** (*β -phenylacrylic acid*), sublimation point of (LIEBERMANN and RIIBER), A., i, 648.
- ethyl ester, action of aniline and hydroxylamine on (TINGLE), A., i, 544.
- condensation of, with phenylacetonitrile (ERLENMEYER), A., i, 493.
- Cinnamic acid**, *m*- and *p*-amino-, glycinyl derivatives of the esters of (EINHORN and OPPENHEIMER), A., i, 494.
- alloeinnamic acid**, boiling point of (LIEBERMANN and RIIBER), A., i, 648.
- Cinnamonitriles**, *o*-nitro- and *o*-amino-, isomeric change of (PSCHORR and WOLFES), A., i, 170.
- Cinnamylguaiacol** (COHN), A., i, 548.
- Cinnamylidenecetic acid**, and the *alloe*-acid, sublimation points of (LIEBERMANN and RIIBER), A., i, 648.
- Cinnamylidene-2-naphthylamine**, 1-bromo- and 1-chloro-, and their hydrocyanides (MORGAN), T., 1217; P., 1900, 171.
- Cinnamylidenesemicarbazone**, oxidation of (YOUNG and WITHAM), T., 230; P., 1900, 5.
- Circulation**, influence of iodine, sodium iodide, and iodothyron on the (BARBERA), A., ii, 291.
- influence of removal of water on the (STRAUB), A., ii, 91.
- Citral**, from oil of verbena (KERSCHBAUM), A., i, 353.
- stereoisomerism of (TIEMANN and KERSCHBAUM), A., i, 331; (BARBIER), A., i, 508.
- colour reaction for (BURGESS), A., ii, 774.
- b-Citralideneacyanoacetic acid** (TIEMANN), A., i, 331.
- Citraprotartaric acid**. See **Methylsuccinic acid**.
- Citrazinic acid**, constitution of (SELL and DOOTSON), T., 233; P., 1900, 9.
- Citric acid** in saturation-sludge (ANDRLIK), A., ii, 679.
- oxidation of, by potassium permanganate (DENIGES), A., i, 89, 204, 274; (SABBATANI), A., i, 536.
- physiological action of (SABBATANI), A., ii, 32.
- Citric acid**, salts of, oxidation of, by potassium permanganate or by iron (SABBATANI), A., i, 536.
- alkali copper salts of (BULLNHEIMER and SEITZ), A., i, 330.
- detection of (DENIGES), A., i, 89.
- detection of salicylic acid in presence of (LANGKOPF), A., ii, 695, 769; (CONRADY; GEROCK), A., ii, 769; (KLETT), A., ii, 770.
- Citronella oil** (SCHIMMEL and Co.), A., i, 184.
- estimation of geraniol in (SCHIMMEL and Co.), A., ii, 175.
- Citronellal**, isomeric change of (LABBÉ), A., i, 136.
- Citronellaldimethylacetal** (HARRIES), A., i, 331.
- Citronellol** (BOUVEAULT), A., i, 452.
- Citronellyl and Citryl barium sulphites**, formation of (LABBÉ), A., i, 137.
- Civet**, constituents of (WALBAUM), A., i, 509.
- Clay**, fireproof, from Moravia (KUVÁK), A., ii, 147.
- rapid estimation of, in soils (POQUILLON), A., ii, 316.
- separation of, from sand in soils (SCARLATA), A., ii, 368.
- Clays**, examination of (GLINKA), A., ii, 89.
- estimation of sand in (CRONQUIST), A., ii, 171.
- Clover**. See **Agricultural Chemistry**.
- Coal** from Bohemia (EICHLEITER), A., ii, 354.
- from New Zealand, composition of (BEDSON), A., ii, 20.
- spontaneous combustion of (GRIMM), A., ii, 205.
- apparatus for determining the calorific value of (MAGNANINI and ZUNINO), A., ii, 465.
- analysis (NOYES, HILLEBRAND, and DUDLEY), A., ii, 168.
- estimation of phosphorus in (CAMP), A., ii, 756.
- Coal calorimeter**, new (PARK), A., ii, 710.
- Coal gas**, naphthalene vapour in (ALLEN), A., i, 339.
- estimation of benzene and ethylene in (HABER), A., ii, 629.
- estimation of naphthalene in (COLMAN and SMITH), A., ii, 372.
- Cobalt**, atomic weight of (RICHARDS and BAXTER), A., ii, 78.
- specific heat of (TILDEN), A., ii, 524.
- passivity of (HITTORF), A., ii, 706.
- occlusion of hydrogen by (BAXTER), A., ii, 78.

- Cobalt salts**, oxidation of, in alkaline solution (JOB), A., ii, 657.
- Cobalt borates** (OUVRARD), A., ii, 207.
- chloride, thermal capacity and colour changes of solutions of (WREWSKY), A., ii, 63.
- fluoride, double salts of, with aluminium or ferric fluoride (WEINLAND and KÖPPEN), A., ii, 143.
- nitrite, double potassium and sodium salt of (ADIE and WOOD), T., 1076; P., 1900, 17.
- sodium nitrite, preparation of (BILLMANN), A., ii, 624.
- oxides, formation of (MAWROW), A., ii, 596.
- hydrated, green- and buff-coloured (HARTLEY), P., 1899, 202.
- phosphide, preparation of (MARONNEAU), A., ii, 281.
- potassium sulphate (MALLET), T., 222; P., 1899, 227.
- Cobalt organic compounds** :—
- Cobaltammonium compounds**, thiocyanate (WERNER, MÜLLER, KLIEN, and BRÄUNLICH), A., i, 86; (V. ZAWIDZKI), A., i, 210.
- thiocyanate and its double salts (MIOLATI), A., i, 381.
- Oxycobaltamine thiocyanates** (MASCETTI), A., i, 541.
- Cobaltcyanides**, their preparation and use in analysis (MILLER and MATHEWS), A., ii, 318; (MATHEWS), A., ii, 578.
- Cobaltocyanide**, potassium, oxidation of, by atmospheric oxygen (MANCHOT and HERZOG), A., ii, 546.
- Cobalt, estimation and separation of** :—
- estimation of, in New Caledonian ores (MOORE), A., ii, 764.
- estimation and separation of small quantities of, in presence of nickel (MOORE), A., ii, 764.
- separation of, from nickel, by the action of ammonium hydroxide on the ferricyanides (BROWNING and HARTWELL), A., ii, 765.
- separation of, from nickel, by means of persulphates (MAWROW), A., ii, 596, 765.
- separation of, from nickel, by means of their sulphides (TOWER), A., ii, 690.
- Cobalt ores**, auriferous, from the Transvaal (OEHMICHEN), A., ii, 147.
- Cobra toxin and antitoxin** (MYERS), A., ii, 558.
- Cocaine**, chromic acid test for (SCHAEFER), A., ii, 58.
- Cochinelle acid**, mixed esters and diketohydrindene derivatives of (LANDAU), A., i, 661.
- Cocoanut ash**, composition of (BACHOFEN), A., ii, 302; (BAIN and BACHOFEN), A., ii, 497.
- Codeine**, colour test for (KOBERT), A., ii, 121.
- Cerulein and Cerulin** and their acetyl derivatives (ORNDORFF and BREWER), A., i, 448.
- Coffee extracts**, their composition and analysis (MOOR and PRIEST), A., ii, 379.
- Coke**, estimation of volatile combustible matter in (MEADE and ATTIX), A., ii, 168.
- estimation of phosphorus in (CAMP), A., ii, 756.
- Colloid**, ovarian (PANZER), A., i, 70.
- Colloidal solutions**, nature and properties of (BREDIG and COEHN), A., ii, 269; (BRUNI and PAPPADÀ), A., ii, 591.
- dissociation in (LEVI), A., ii, 646.
- metallic (STOECKL and VANINO), A., ii, 11, 713; (ZSIGMONDY), A., ii, 397.
- preparation of, by the electric discharge (BREDIG), A., ii, 213.
- Colloids**, absorption and emission of water vapour by (DUHEM), A., ii, 338.
- absorption of matters from solution by (VAN BEMMELLEN), A., ii, 466.
- Colophony oil**, composition of (KRAEMER and SPILKER), A., i, 150.
- Coloradoite** (?) from California (HILLEBRAND), A., ii, 22.
- Colour of alkali nitrites** (DIVERS), P., 1900, 40.
- of bromine and iodine compounds, effect of very low temperatures on (KASTLE), A., ii, 526.
- of chlorine solutions (SABLES), A., ii, 72.
- of solutions of chrome alum, change in (WHITNEY), A., ii, 211; (VENABLE), A., ii, 349.
- of solutions of cobalt chloride, change of (WREWSKY), A., ii, 63.
- of Congo-red, cause of the change of, by the action of acids (SCHIMANSKY), A., i, 305.
- of minerals (NABL), A., ii, 661.
- of picric acid and its solutions (MARCKWALD), A., i, 391.
- of aqueous salt solutions, causes of the changes of (KONOWALOFF), A., ii, 266.
- of sodium nitrite solutions (BOGUSKI), A., ii, 75.
- changes. See also Phototrophy.
- Colour-bases**, transformation of, into pseudo-ammonium hydroxides, -cyanides, and -sulphonic acids (HANTZSCH and OSSWALD), A., i, 256.

Coloured substances, derived from nitro-compounds (HANTZSCH and KISSEL), A., i, 89; (JACKSON and GAZZOLO), A., i, 438.

Colouring matters from p-aminophenol, hydroxyazobenzene and sulphur (RIS), A., i, 419.

of annatto (ZWICK), A., i, 518.

of *Arctostaphylos Uva-ursi*, *Coriaria myrtifolia*, *Hæmatoxylon campechianum*, *Myrica Gale*, *Rhus Melopium*, and *Robinia Pseudacacia* (PEEKIN), T., 423; P., 1900, 45.

in blood, simultaneous estimation of two (HÜFNER), A., ii, 459.

of chlorophyll and their spectra (MARCHLEWSKI and SCHUNCK), T., 1080; P., 1900, 148.

coal-tar, detection of, in food and fruit products (WINTON), A., ii, 776.

from *Digitalis lutea* (ADRIAN and TRILLAT), A., i, 185.

$C_{18}H_{12}ON_2$ of *Echinus esculentus* (GRIFFITHS), A., ii, 677.

of the formazyl group (FICHTER and SCHIESS), A., i, 366.

of leaves (SCHUNCK), A., ii, 36.

$C_{22}H_{16}O_4$ from the oxidation of methoxynaphthol (RUSSIG), A., i, 602.

of saffron (HILGER), A., i, 682.

in "sugar-colours," and their detection (SCHWEITZER), A., i, 277.

resembling indulines, electrolytic preparation of (LÖB), A., i, 464.

oxazine, constitution of (KEHRMANN), A., i, 61; (GREEN), A., i, 119.

oxazine, safranine, and thiazine, o-quinonoid structure of (GREEN), A., i, 119.

new blue, of the thiazine series (SCHAPOSCHNIKOFF), A., i, 523.

influence of the orientation of chromophores on the colour and other properties of (REVERDIN and CRÉPIEU), A., i, 701.

methylation of (PRUD'HOMME), A., i, 244, 455.

combination of basic with acidic (SEYEWETZ), A., i, 356.

acidic, composition of, with compounds of magenta (SEYEWETZ), A., i, 522.

having a basic chromophore, compounds of, with magenta (SEYEWETZ), A., i, 645.

sulpho-azo-, compounds of, with magenta (SEYEWETZ), A., i, 614.

new, of acid function (PRUD'HOMME), A., i, 455.

new blue, fast to alkalis (PRUD'HOMME), A., i, 455.

Colouring matters, basic and tanning, Ullmann's tests for (HEINEMANN), A., ii, 380.

precipitation of, by ammonium persulphate (PRÖSCHER), A., i, 454.

Colouring matters. See also:—

Acacetin.

Alkaramel.

Apigenin.

Apigetrin.

Apin.

Bilirubin.

Brazilein.

Brazilin.

Chloroglobin.

Tetramethylhæmatoxylin.

Trimethylbrazilin.

Urobilin.

Vitexin.

Columbinin, action of dilute acids, alcohol, and heat on (PANORMOFF), A., i, 709.

Columbite group, a mineral of the (GOODWIN and MILLER), A., ii, 662.

Combustion, apparatus for demonstrating the reciprocal nature of (TEGLU), A., ii, 71.

Comenic acid, constitution of (PERATONER and LEONARDI), A., i, 550. diethyl ester (OLIVERI-TORTORICI), A., i, 587.

Compositæ, distribution of alkaloids in (GRESHOFF), A., i, 556.

Conchiolin, decomposition products of (WETZEL), A., i, 71.

Condensation waves, propagation of, in heated gases (LE CHATELIER), A., ii, 645.

Conductivity, electrical. See Electrochemistry.

heat. See Thermochemistry.

Congo-red, cause of the change of colour of, by the action of acids (SCHIMANSKY), A., i, 305.

Conifer-seeds, decomposition products of proteids of (SCHULZE and WINTERSTEIN), A., ii, 101.

Coniine, detection of, in poisoning cases (VITALI and STROPPIA), A., ii, 639.

Consolicine and Consolidin (GRIMMER), A., i, 684.

Copper in plants (MACDOUGAL), A., ii, 235.

electrochemical equivalent of (RICHARDS, COLLINS, and HEIMROD), A., ii, 256.

heat of combination of, with zinc (BAKER), P., 1899, 195; (GALT), A., ii, 189.

solution of, in gelatin solutions (LIDOFF), A., ii, 77.

precipitates in analysis (IMMERWAHR), A., ii, 642.

Copper-ammonium chromate, a new (SCHUYTEN), A., ii, 279.

iodides, reactions of (POZZI-ESCOT), A., ii, 207.

Copper alloys with zinc, negative heat of formation of (BAKER), P., 1899, 195; (GALT), A., ii, 189.

action of, on nitric acid (GLADSTONE), A., ii, 710.

Copper salts, solubility of, in sucrose solutions (STOLLE), A., i, 333.

action of alkali hydroxides and bromine on (VITALI), A., ii, 208.

carbonate (GRÜGER), A., ii, 542.

chloride, combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1245; P., 1900, 172.

fluoride, double salts with aluminium fluoride (WEINLAND and KÖPFEN), A., ii, 144.

haloids, double salts with ammonium thiosulphate (ROSENHEIM and STEINHÄUSER), A., ii, 653.

oxide, combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1255; P., 1900, 173.

oxides, action of acetylene on (GOOCH and BALDWIN), A., i, 74.

sulphate, combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1243; P., 1900, 172.

estimation of the purity of, and of the amount of, in copper pyrites (MONTANARI), A., ii, 315.

estimation of (ZECCHINI), A., ii, 762.

manganese sulphates, solubility of (STORTENBEKKER), A., ii, 530.

polysulphide (BODROUX), A., ii, 480.

sulphites and thiosulphate, double, with the alkali metals (ROSENHEIM and STEINHÄUSER), A., ii, 652.

sulphovanadite. See Sulvanite.

thioantimonites and their double salts with potassium (POUGET), A., ii, 84.

Copper:—

Cupric salts, oxidising action of, in presence of cyanogen compounds (SCHAER), A., i, 512; ii, 583.

chloride, solubility of, in organic liquids (OECHSNER DE CONINCK), A., ii, 542.

oxide, hydrated, formation of (MAWROW), A., ii, 402.

sulphate, reaction of solutions of, with magnesium, iron, or zinc (CAVEN), P., 1899, 232; A., ii, 344.

Cuprous chloride, compounds of, with acetylene and potassium chloride (CHAVASTELON), A., i, 470.

compounds of, with carbon monoxide (JONES), A., ii, 17.

Copper organic compounds:—

Cupric methyl- and benzyl-salicyl-imides (DELEPINE), A., i, 177.

Cuprous acetylde, compounds of, with cuprous iodide (BERTHELOT and DELEPINE), A., i, 324.

Copper, detection, estimation, and separation of:—

detection of (CAZENEUVE), A., i, 465; (VITALI), A., ii, 208.

analysis of (CLARK), A., ii, 369; (HOLLARD), A., ii, 442.

estimation of (WILLENZ), A., ii, 315.

estimation of, volumetrically (PARR), A., ii, 762.

estimation of, in cyanide solutions (CLENNELL), A., ii, 370.

estimation of, in iron (HEKTING), A., ii, 245.

estimation and separation of, by sodium hydroxide and hydrazine sulphate or hydrochloride (JANNASCH and BIEDERMANN), A., ii, 315.

estimation of oxygen in, by ignition in hydrogen (ARCHBUTT), A., ii, 756.

Copper pyrites, estimation of copper sulphate in (MONTANARI), A., ii, 315.

Coprosterol, origin of, in the intestine (MÜLLER), A., ii, 289.

Coral (*Heliopora corallina*), blue pigment of (LIVERSIDGE), A., i, 70.

Corals, iodine in (MENDEL), A., ii, 677.

Cordylite (*barium-parisite*) from Greenland (FLINK), A., ii, 410.

Coriaria myrtifolia, constituents of (PERKIN), T., 428; P., 1900, 45.

Cork oak. See Agricultural Chemistry.

Corn oil. See Maize oil.

Cornutine, estimation of (MUSSET), A., ii, 121.

Corresponding states (MEYER), A., ii, 263; (BERTHELOT), A., ii, 335, 646.

Corrosive sublimate. See Mercuric chloride under Mercury.

- Cortex Lokri*, constituents of (VAN DEN DRIESSEN-MAREEUW), A., ii, 102.
- Corundum** from Eastern Ontario (MILLER), A., ii, 552.
and corundum-bearing rock, composition of (GOODWIN), A., ii, 661.
- Cotarnine** and its derivatives (FREUND and PREUSS), A., i, 248.
formula of (DECKER), A., i, 683.
oxidation products of (WULFF), A., i, 607.
cyanide as a pseudo-salt (HANTZSCH and KALB), A., i, 557.
- ψ-**Cotarnine** and its cyanide (HANTZSCH and KALB), A., i, 115.
- Cotarnimethylimine** (WULFF), A., i, 607.
- Cotoin** (HESSE), A., i, 35.
- Cotton-seed oil**, adulteration of, with maize oil (MORPURGO and GÖTZL), A., ii, 377.
Bechi's test for (VAN ENGLEN; SOLT-SIEN), A., ii, 116.
Halphen's colour reaction for the identification of (RAIKOW), A., ii, 698.
Bechi and Halphen's colour tests for, in oils (RAIKOW and TSCHERWENIWANOW), A., ii, 252.
estimation of, by Halphen's test (STRZYZOWSKI), A., ii, 325; (OILAR), A., ii, 772.
- Coumarilic acid**, bromo- and chloro- (STOERMER), A., i, 654.
dibromo- (SIMONIS and WENZEL), A., i, 231, 496, 648.
- Coumarin**, preparation and constitution and bromine derivatives of (SIMONIS and WENZEL), A., i, 231, 496, 648.
- Coumarins** (v. PECHMANN; v. PECHMANN and SCHALL), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- Coumarone** and its polymeride, and chloro-, bromo-, and bromonitro-derivatives (STOERMER), A., i, 650.
bromo-derivatives (SIMONIS and WENZEL), A., i, 232, 497, 648.
- Coumarone resin** (KRAEMER and SPILKEE), A., i, 656.
- Coumaroxycetic acid**, bromo- (STOERMER), A., i, 654.
- Cows**. See Agricultural Chemistry.
- Crackene** from mineral oil (KLAUDY and FINK), A., i, 284.
- Cream**, analysis of (RICHMOND), A., ii, 696.
See also Agricultural Chemistry.
- Creatine** and **Creatinine**, physiological action of (MALLER), A., ii, 156.
- "**Cremomites**," new explosives (ALVISI), A., ii, 205.
- Cresote**, assay of (HALL), A., ii, 580.
wood-tar, estimation of guaiacol in (KEBLER), A., ii, 176.
- o-Cresol**, tetra- and penta-bromo- (AUWERS and ANSELMINO), A., i, 160.
4-nitro- (HILL, SOCH, and OENSLAGER), A., i, 538.
- m-Cresol**, specific heat and heat of vaporisation of (LUGININ), A., ii, 334.
estimation of, in mixtures of cresols (RASCHIG), A., ii, 694.
- m-Cresol**, tetrabromo- (AUWERS and ANSELMINO), A., i, 160.
and its acetyl and benzoyl derivatives (AUWERS and BULLOWS), A., i, 99.
ω:2:4:5:6-pentabromo- (AUWERS and ANSELMINO), A., i, 160; (AUWERS and BROICHER), A., i, 162.
5:2-bromonitro- (THIELE and EICHWEDE), A., i, 501.
- p-Cresol**, tribromo-, product of the action of nitric acid on, and its acetyl derivative (ZINCKE), A., i, 545.
5:3-bromoamino- and 5:3-bromonitro- (THIELE and EICHWEDE), A., i, 501.
- Cresols**, o-, m-, and p-, condensation of, with ethyl phenylpropiolate (RUHEMANN and BEDDOW), T., 984, 1119; P., 1900, 123, 165.
analysis of mixtures of phenol and (DITZ and CEDIVODA), A., ii, 54; (VAUBEL), A., ii, 112.
estimation of (CLAUSEE), A., ii, 319.
- Cresols**, o-, m-, and p-, bromo- and chloro-derivatives, action of nitrous and nitric acids on (ZINCKE), A., i, 545.
- Cresoxy-**. See Tolyoxy-.
- Cresses**. See *Barbarea praecox*, *Lepidium sativum*, and *Nasturtium officinale*.
- Critical constants** of diisopropyl and diisobutyl (YOUNG and FORTY), T., 1126; P., 1900, 165.
of n-octane (YOUNG), T., 1145; P., 1900, 166.
density and the law of Cailletet and Mathias (YOUNG), A., ii, 711.
point of pure liquids and mixtures, disturbing influences at the (v. HIRSCH), A., ii, 388.
state (DINTERICI), A., ii, 67.
temperature of complete mixture, influence of pressure on (VAN DER LEE), A., ii, 129.
of organic sulphur compounds (FERRETTO), A., ii, 386.
- Cretonic acid**, mercuri-compound of (LEY), A., i, 382.
ethyl ester, condensation of, with ethyl oxalate (LAPWORTH), P., 1900, 132.

- Grotonic acid**, β -amino-, ethyl ester, action of phenylcarbinide on (BEHREND and MEYER), A., i, 287.
- α - and β -bromo- (MELIKOFF), A., i, 536.
- β -bromoamino- and β -chloroamino-, ethyl ester (BEHREND and SCHREIBER), A., i, 210.
- γ -chloro-, and its nitrile and ethyl ester (LESPIAU), A., i, 425.
- α -cyano-, ethyl ester, β -amino-, and β -alkyloxy derivatives of (HALLER), A., i, 373.
- Cryoscopic behaviour** of nitro-derivatives in formic acid (BRUNI and BERTI), A., ii, 591.
- of substances with constitutions similar to that of the solvent (GARELLI and CALZOLARI), A., ii, 65.
- observations, apparatus for (BATELLI and STEFANINI), A., ii, 709.
- observations in various solvents (AUWERS), A., ii, 262.
- Cryoscopy**, antimony trichloride as a solvent in (TOLLOZKO), A., ii, 190.
- of phenols, influence of the solvent on (AUWERS, BARTSCH, and SMITH), A., ii, 66.
- of Tanret's rhamnino- and rhamnino-trionic acid (PONSOT), A., i, 333.
- See also Freezing point.
- Crystalline-liquids** (SCHENCK), A., ii, 339.
- Crystallography** and atomic weights (MUTHMANN), A., ii, 533; (LINCK), A., ii, 717.
- of *d*- and *l*-isomarine (POPE), T., 787; P., 1900, 118.
- Crystals**, apparatus for dissolving (HOPKINS), A., ii, 71.
- mixed (ROOZEBOOM), A., ii, 64, 70, 132; (VAN EIJK), A., ii, 133; (ADRIANI), A., ii, 462.
- formation and transition of (HISINK), A., ii, 339.
- conversion of, into a compound (ROOZEBOOM), A., ii, 70.
- of mercuric bromide and iodide (REINDERS), A., ii, 70.
- of potassium and thallium nitrates, formation and transition of (VAN EIJK), A., ii, 133.
- Crystal-violet and Crystal-violet leuco-hydroxide salts** (HANTZSCH), A., i, 365.
- ψ -Cumene (1:3:4-triethylbenzene), refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.
- ψ -Cumene-diazocyanide, and -diazonium cyanide (HANTZSCH), A., i, 568.
- ψ -Cumenediazohaloids (HANTZSCH), A., i, 568.
- ψ -Cumenesyndiazotate, potassium (HANTZSCH), A., i, 567.
- ψ -Cumenol, sodium derivative, compounds of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 394.
- tribromo-, isomeric, constitution, and oxidation products of (AUWERS; AUWERS and EBNER), A., i, 161.
- ψ -Cumenoxypropionacetal (STOERMER), A., i, 653.
- $\alpha\psi$ -Cumenoxypropionic acid and its ethyl ester (BISCHOFF), A., i, 394.
- Cuminuric acid, ethyl ester (RÜGHEIMER and FEHLHABER), A., i, 610.
- Cuminuroflavin (*di-p-isopropylhippuroflavin*) and its anilides (RÜGHEIMER and FEHLHABER), A., i, 610.
- Cuminylidenebisdimethyldihydroresorcinol (VORLÄNDER and STRAUSS), A., i, 100.
- Cuminylidene-2-naphthylamine, 1-bromo- and 1-chloro-, and their hydrocyanides (MORGAN), T., 1216; P., 1900, 171.
- Cuprene, formation of (SABATIER and SENDERENS), A., i, 197, 421.
- Cupric and Cuprous. See under Copper.
- Curangin and Curangaegenin (BOERSMA), A., i, 243, 304.
- Currents. See Electrochemistry.
- Cyanamides, formation of, from the action of cyanogen bromides on tertiary amines (v. BRAUN), A., i, 430, 641.
- combination of, with ethyl or methyl alcohol (STIEGLITZ and MCKEE), A., i, 340.
- Cyanogen, action of, on aromatic amines (MEVES), A., i, 483.
- bromide, action of, on tertiary amines (v. BRAUN), A., i, 430, 641, 687.
- and aluminium chloride, action of, on benzenoid hydrocarbons (SCHOLL and NÖRR), A., i, 386.
- action of, on diethyl- and dimethyl-aniline (SCHOLL and NÖRR), A., i, 435.
- action of, on ethyl acetonedicarboxylate (DERÔME), A., i, 426.
- triselenide (MUTHMANN and SCHREÜDER), A., i, 479.
- Hydrocyanic acid (Hydrogen cyanide)** in Vicia seeds (BRUYNING and VAN HAARST), A., ii, 160.
- preparation of (BROWNING), T., 1235; P., 1900, 172.
- constitution of (WADE), P., 1900, 156.
- dissociation constant of (WALKER and CORMACK), T., 15; P., 1899, 208.

Cyanogen :—

Cyanides, double, electrical conductivity of (WALDEN), A., i, 430.

isoCyanic acid, relation of, to fulminic acid (SCHOLL and KACER), A., i, 218.

isoCyanides, compounds of, with aldehydes and alkyl iodides (WADE), P., 1900, 157.

"Cyanide musk." See Butylxyl cyanide, *dinitro*.

Cyanomethæmoglobin. See under Hæmoglobin.

p-Cyantoline (PIEPES-PORATYŃSKI), A., i, 648.

Cyan-o- and -m-xylins (SCHOLL and NÖBB), A., i, 386.

Cyaphenin from benzenylmethylimino-chloride (v. PECHMANN and OBERMILLER), A., i, 294.

Cyclic compounds (KURSAOFF), A., i, 89.

behaviour of, at low temperatures (MARKOWNIKOFF), A., i, 18.

oxidation of (MARKOWNIKOFF), A., i, 475.

Cycloptertine, a new protamine (MORROWIN), A., i, 72.

Cymene from fir-wood (*Pinus Abies*) (KLASON), A., i, 676.

2-chloro- and 2-bromo- from carvone (KLAGES and KRAITH), A., i, 48.

Cymene (1:4-methylisopropylbenzene) refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.

Cynoglossine (GREIMER), A., i, 683.

Cystin from keratin (MÜRNER), A., i, 128.

detection and estimation of, in well waters (CAUSSE), A., ii, 457, 458.

Cystinuria, excretion of diamines in (CAMMIDGE and GARROD), A., ii, 229.

Cytisine and its alkyl derivatives (RAUWERDA), A., i, 607, 684.

and its physiological action (SCHMIDT; LITTSCHNEID), A., i, 513.

action of phenylthiocarbimide on (LITTSCHNEID), A., i, 513, 516.

Cytotoxins (BORDET; CANTACUZÈNE; BESREDKA; METCHNIKOFF; METCHNIKOFF and BESREDKA), A., ii, 741.

D.

Dacite from Sumatra (MILCH), A., ii, 150.

Damascenine and its salts (POMMERHNE), A., i, 684.

from nigella oil (SCHIMMEL and Co.), A., i, 184.

Dammar, examination of (DIETERICH), A., ii, 118.

Datolite from Dartmoor (BUSZ), A., ii, 217.

Datura Stramonium, estimation of the alkaloids of the leaves of (SCHMIDT), A., ii, 379.

Decahydroacridinedione, base, $C_{13}H_{13}O_2N$ from (VORLÄNDER and KALKOW), A., i, 99.

Decane-*ax*-dicarboxylic acid (KOMPPA), A., i, 201.

Decarboxy*di*bromocarmine acid and its acetyl and benzoyl derivatives (LIEBERMANN, HÖRING, and WIEDERMANN), A., i, 236.

Decarbusic acids, *n*- and *iso*- (WIDMAN), A., i, 347.

Decenoic acids (WALLACH), A., i, 590.

Decolic acids, amino- (WALLACH), A., i, 590.

Decomposition. See under Affinity.

Dehydracetic acid (COLLIE), T., 971; P., 1900, 147.

action of hydroxylamine on, and its oximes (MINUNNI), A., i, 198.

Dehydrocamphoric acid, formation and oxidation of (LAPWORTH), T., 1056; P., 1900, 128.

Dehydropiperonalphenylhydrazone (MINUNNI), A., i, 260.

Denitrification. See Agricultural Chemistry.

Density of chemical compounds in relation to composition and constitution (KANONNIKOFF), A., ii, 134.

conductivity and surface tension of aqueous solutions containing potassiumchloride and sulphate (BARNES), A., ii, 332.

determinations, new pycnometer for (GÜCKEL), A., ii, 193.

of liquids and saturated vapours (v. HIRSCH), A., ii, 9.

of the halogens, nitrogen and oxygen at their boiling points (DRUGMAN and RAMSAY), T., 1228; P., 1900, 172.

of erbium, yttrium, and zirconium (MEYER), A., ii, 143.

of sodium tungstate solutions (PAWLEWSKI), A., ii, 400.

of sulphur perfluoride (MOISSAN and LEBEAU), A., ii, 342.

of tellurium (LENHER and MORGAN), A., ii, 273.

of yttria (MUTHMANN and BÖHM), A., ii, 209.

See also Vapour density.

Deoxybenzoic benzylideneanilines and their hydrochlorides, isomeric (FRANCIS), T., 1191; P., 1900, 169.

- Deoxycaffeine** (5-oxy-1:4:6-trimethyl-6:7-dihydropurine) and its salts (BAILLIE and TAFEL), A., i, 121.
- Deoxymorphine** (SCHRYVER and LEES), T., 1024; P., 1900, 143.
- Deoxytheobromine** (5-oxy-1:4-dimethyl-6:7-dihydropurine) (TAFEL), A., i, 121.
- Derride**, a fish poison, and its anhydride (VAN SILLEVOLDT), A., i, 109.
- Desylacetomesitone** and **Desyl- α - and - β -acetonsaphthones** (SMITH), A., i, 38.
- Dextran**, formation of, by micro-organisms (BORKHOUT), A., ii, 742.
- Dextrins**, preparation of (PRIOR and WIEGMANN), A., i, 541.
formation of, from starch, and action of amylase, on (POTTEVIN), A., i, 80.
nomenclature of (SYNIEWSKI), A., i, 79.
of saccharification (PETIT), A., i, 589.
- Dextrins**. See also Achroodextrin and Maltodextrin.
- Dextrose** (d-glucose, grape sugar) in beet leaves (LINDER), A., ii, 302.
action of potassium persulphate on (MORRELL and CROFTS), T., 1220; P., 1900, 172.
derivatives of (KOENIGS and KNORR), A., i, 588.
phenylosazones of (NEUBERG), A., i, 139.
- Diabase**, weathering of, in Virginia (WATSON), A., ii, 488.
- Diabetes mellitus**, sugar formation in (ROSENQVIST), A., ii, 155.
- Diacetanilide**, 2:6:4-dichloronitro- (CHATTAWAY and ORTON), A., i, 643.
- Diacetone-allyl- and -phenyl-thiocarbamides** and oxime (TRAUBE and LORENZ), A., i, 116.
- Diacetonecamine**, carbamide and guanidine derivatives of (TRAUBE and SCHALL), A., i, 118.
carbamide and thiocarbamide derivatives of (TRAUBE and LORENZ), A., i, 115.
- Diacetoneguanidine** and its acetyl derivative (TRAUBE and SCHWARZ), A., i, 117.
- Diacetone-tolylthiocarbamide** (TRAUBE and SCHALL), A., i, 118.
- Diaceoxymorphine** (*heroin*), colour test for (KOBERT), A., ii, 121.
- Diaceoxystilbene** (NEF), A., i, 21.
- Diaceoxytetramethylstilbene**, tetra-bromo- (AUWERS, TRAUN, and WELDE), A., i, 168.
- Diacetyl**-. See also under Parent Substance.
- Diacetylacetone**, action of methyl iodide on the sodium derivative of, and orcinol derivatives from (COLLIE and STEELE), T., 961; P., 1900, 146.
- 1:7-Diacetyl-amino- β -naphthol** (KEHRMANN and WOLFF), A., i, 449.
- Diacetylaminophenolsulphonic acid** (COHN), A., i, 29.
- Diacetylanthranilic acid**, methyl ester (ERDMANN), A., i, 188.
- Diacetyldioxime**, compounds of, with certain solvents (PETRENKO-KRITSCHENKO and KASANEZKY), A., i, 350.
- Diacetyl-diphenyl and -ditolyl-ethenyl-amidines** (TRAUBE and EYME), A., i, 119.
- $\beta\beta$ -Diacetylpropionic acid**, methyl and ethyl esters (MARCH), A., i, 374.
- $\alpha\beta$ -Diacetylpyroterebic acid**, ethyl ester (PAULY and LIECK), A., i, 275.
- Diacetyltartaric acid**, diethyl ester, rotation of (McCRAE and PATTERSON), T., 1096; P., 1900, 161.
- Diacylamarines**, constitution of (JAPP and MOIR), T., 632; P., 1899, 212.
- isoDialdane** (DE BRUYN and BIJL), A., i, 205.
- Dialkylamaronium salts**, constitution of (JAPP and MOIR), T., 615; P., 1899, 212.
- Diallage** from Russia (TARASSENKO), A., ii, 26.
- Diamines**, behaviour of, on neutralisation (BERTHELOT), A., i, 83.
- Disoamyl-dibromocamine**, action of silver oxide on (KJNER), A., i, 629.
- Diamyldisulphoneacetonephthalamic acid**, salts of (POSNER and FAHRENHORST), A., i, 17.
- β -Diamyldisulphonepropyl-carbamide**, and -thiocarbamide (POSNER and FAHRENHORST), A., i, 17.
- Dianiline** antimonibromide (HIGBEE), A., i, 285.
stannibromide (RICHARDSON and ADAMS), A., i, 151.
- Dianilinophenylbenzoquinone** (BORSCHKE), A., i, 594.
- Dianilino-orthophosphoric acid**, and di-p-chloro-, and -phosphoryl chloride (AUTENRIETH and RUDOLPH), A., i, 570.
- Dianilinoquinoneanil**, electrolytic preparation of (LÖB), A., i, 464.
- Diantipyrinemethane**. See Formopyrine.
- Diaspartidodiaspartic acid** and its ammonium salts (SCHIFF), A., i, 279.
- Diastase**, decomposition of, during fermentation (HEINZELMANN), A., ii, 230.

- Diastase**, proteolytic, of malt (FERNBACH and HUBERT), A., i, 576.
influence of phosphates and other inorganic compounds on the (FERNBACH and HUBERT), A., i, 616.
- m*-**Diazines**. See Pyrimidines.
- Diaoacetic acid**, ethyl ester, polymerisation products from (HANTZSCH and SILBERRAD), A., i, 261.
- Diaoaminobenzene**, copper derivatives of (MEUNIER and RIGOT), A., i, 316; (MEUNIER), A., i, 571.
- Diaoaminobenzenedi-*p*-sulphonic acid**, isomeric forms of (VAUBEL), A., i, 615.
- Diaoazobenzenetrisulphonic acid**, potassium salt (JUNGHAHN and NEUMANN), A., i, 418.
- Diaobenzene**, action of, on isonitromethane (BAMBERGER, SCHMIDT, and LEVINSTEIN), A., i, 566.
chloride, action of α -methyltetronic acid on (WOLFF and HEROLD), A., i, 585.
nitrate from nitrosophenylhydrazine (RÜGHEIMER), A., i, 532.
- Diaobenzenebenzylamine**, *p*-nitro- (WOHL and SCHIFF), A., i, 708.
- Diaobenzenehydrazides** (WOHL and SCHIFF), A., i, 707.
- Diaobenzene-*m*-hydrazinobenzoic acid** (WOHL and SCHIFF), A., i, 708.
- Diaobenzeneimide**, *pentabromo*- (HANTZSCH and SMYTHE), A., i, 316.
- Diaobenzeneophenylhydrazide** and its halogen derivatives and their oxidation with permanganate (WOHL and SCHIFF), A., i, 707.
- Diaobenzeneopiperidine** and its sulphonic acid, action of bromine on (WALLACH and TEWES), A., i, 265.
- Diaobenzene-*o*-sulphonic acid**. See Benzenediazonium-*o*-sulphonic acid.
- Diaobenzoic acid phenylhydrazide**, *m*- and *p*- (WOHL and SCHIFF), A., i, 708.
- Diaocaffeine** and its derivatives (GUMBERG), A., i, 263.
- Diao-compounds**, nomenclature of the (HANTZSCH), A., i, 702.
normal, as pseudodiazonium compounds (HANTZSCH), A., i, 126.
- Diaoocyanides** (HANTZSCH), A., i, 567, 569.
- syn*-**Diaoocyanides**, interaction of, with cuprous compounds (HANTZSCH and BLAGDEN), A., i, 704.
- Diaoocymene nitrate**, nitroso- (OLIVERI-TORTORICI), A., i, 553.
- Diao-haloids** and -thiocyanates (HANTZSCH), A., i, 568.
- Diaoohydrazides**, preparation, characteristics, and oxidation of (WOHL and SCHIFF), A., i, 706.
- Diaoohydroxides** (ENGLER and HANTZSCH), A., i, 566.
- Diaoohydroxyaminobenzene** (BAMBERGER and STIEGELMANN), A., i, 193.
- Diaoic acids**. See Nitramines.
- Diaolone disulphides**, *dithio*-, action of methyl iodide on, and decomposition of thiodiazolones (BUSCH and LINGENBRINK), A., i, 413.
- 5-Diaolone-1-propionic acid**, 3-amino-, and 5-thio-, ethyl esters (BAILEY and ACREE), A., i, 530.
- Diaomethane**, action of, on β -aromatic hydroxylamines (BAMBERGER and TSCHIRNER), A., i, 342.
action of, on picryl acetate (v. PECHMANN), A., i, 313.
- anti*-**Diaonaphthalene salts** (ENGLER), A., i, 568.
- Diaonaphthalene nitrate**, nitroso- (OLIVERI-TORTORICI), A., i, 553.
- Diaonium** (*benzenediazonium*) salts, constitution of (HANTZSCH), A., i, 126; (BAMBERGER), A., i, 193.
decomposition of (HANTZSCH), A., i, 703.
interaction of, with cuprous compounds (HANTZSCH and BLAGDEN), A., i, 704.
chloride, action of ethereal acylcyanoacetates on (FAVREL), A., i, 532.
action of, on alkaline solutions of nitrosophenol (BORSCHKE), A., i, 24, 595.
chlorides, bromo-, transformation of, into chlorodiazonium bromides (HANTZSCH and SMYTHE), A., i, 315.
cyanides (HANTZSCH), A., i, 567.
hydroxides (ENGLER and HANTZSCH), A., i, 566.
nitrate mercurinitrite (HANTZSCH and BLAGDEN), A., i, 704.
- Diaosalicylic acid** and chloride and sulphonic acid (AUDEN), P., 1899, 231.
- o*-**Diaosalicylic acid** and its reactions (ZAHN), A., i, 549.
- syn*-**Diaotates** (HANTZSCH), A., i, 567.
from *p*-bromobenzenediazonium-*o*-sulphonic acid (GERILOWSKI), A., i, 706.
- iso*-**Diaotates**, new method of preparing (BAMBERGER and MÜLLER), A., i, 705.
- Diaotetronic anhydride** (WOLFF and LÜTTRINGHAUS), A., i, 583.
- Diaotetronosulphonic acid**, salts of (WOLFF and LÜTTRINGHAUS), A., i, 584.

- Diazotisation**, velocity of (SCHÜMANN), A., ii, 264.
 elimination of a nitro-group during (MELDOLA and WECHSLER), T., 1172; P., 1900, 167.
- p*-Diazotoluenephnylhydrazide** and its oxidation with permanganate (WOHL and SCHIFF), A., i, 707.
- p*-Diazotoluenepiperidide**, action of bromine on (WALLACH and TEWES), A., i, 265.
- Dibenzaldehyde diperoxide** (V. BAEYER and VILLIGER), A., i, 627.
- Dibenzeneazo- β -dinaphtholmethane**, Abol's. See Benzeneazo- β -naphthol.
- Dibenzoyl-**. See also under Parent Substance.
- Dibenzoyl-*s*-dibenzyl-*i*-diphenylethylenediamine** (JAPP and MOIR), T., 608; P., 1899, 211.

- Dihydroanthracene-2-carboxylic acid**, (LIMPRICHT and LACH), A., i, 31.
- Dihydroasthiotetride**, 2:4-dicyano- and its acetyl derivative; and **Dihydroasthiotetride-4-aminoxime**, 2-cyano- and its acetyl derivatives (HELLSING), A., i, 519.
- Dihydrocamphenes** (SEMMLER), A., i, 351.
- Dihydrocampholenic acid**, its nitrile and amide (MAHLA and TIEMANN), A., i, 507.
- Dihydrocampholytic acid**, β -bromo- (NOYES and PHILLIPS), A., i, 622.
- Dihydrocarveol acetate and chloride** (KLAGES and KRAITH), A., i, 44.
- Dihydrocarvone** (KONDAKOFF and LUTSCHININ), A., i, 104.
- chloride, physical constants of (KLAGES and KRAITH), A., i, 43.
- Dihydrocinchonine**, reactions of (KÖNIGS), A., i, 246.
- Dihydrocinna-m-hydroxamic acid** and its acyl derivatives (THIELE and PICKARD), A., i, 30.
- Dihydrocuminyl alcohol** (SEMMLER), A., i, 454.
- Dihydrocymene**, 2-chloro-, and 2-chloro-bromo- (KLAGES and KRAITH), A., i, 43.
- Dihydrodiazotetronic anhydride** (WOLFF and LÜTTINGHAUS), A., i, 584.
- Dihydrodithiazine derivatives** (HELLSING), A., i, 518.
- Dihydroeucarveol acetate and chloride** (KLAGES and KRAITH), A., i, 43.
- Dihydroisolauronamines** and their derivatives (BLANC), A., i, 239.
- Dihydroiselauronic acid**, constitution of (BLANC), A., i, 329.
- Dihydropyrasine-2:3-diacetic acid**, ethyl ester (THOMAS-MAMERT and WEIL), A., i, 459.
- Dihydropyridinedicarboxylic acids**, substituted, ethyl esters, action of heat on (GUARESCHI and GRANDE), A., i, 112.
- Dihydroresorcinol**, compounds of, with aldehydes (VORLÄNDER and KALKOW), A., i, 99; (VORLÄNDER and STRAUSS), A., i, 100.
- Dihydrotetrasinedicarboxylic acid** (HANTZSCH and SILBERRAD), A., i, 262.
- Dihydrotetrasines** (*bisdiazomethane*) (HANTZSCH and SILBERRAD), A., i, 262.
- Dihydroxamic acid**, imino- (BAMBERGER and MÜLLER), A., i, 145.
- Dihydroxybenziloazone**, *tetrabromo-* (BILTZ), A., i, 663.
- 3:4-Dihydroxybenzoic acid**. See *Protocatechuic acid*.
- 2-mp-Dihydroxybenzylidene-5-methoxy-7-methyl-1:3-diketohydrindene-4-carboxylic acid**, methyl ester (LANDAU), A., i, 662.
- Dihydroxybutanetetra-carboxylic acid**, and its δ -lactone (LEAN), T., 104, 108; P., 1899, 197.

- Dihydroxycerackene** (KLAUDY and FINE), A., i, 284.
- Dihydroxydiazobenzene**, dinitro-dicyano-, and its salts and their reduction (NIETZKI and PETRI), A., i, 486.
- p-Dihydroxydimesitylether**, tetrabromo-, its diacetate and dimethyl derivative (AUWERS and TRAUN), A., i, 168.
- αγ-Dihydroxy-αβ-dimethylpropane** (pentaglycol:1:2-dimethylpropan-1:3-diol) and its diacetyl derivative (SCHMALZHOFFER), A., i, 626.
- αγ-Dihydroxy-βδ-dimethylpropane** (pentaglycol:βδ-dimethylpropan-1:3-diol), action of sulphuric acid on (FISCHER and WINTER), A., i, 472.
- 2:5-Dihydroxydiphenyl** (BORSCHKE), A., i, 594.
- Dihydroxydiphenylmethane-2:4'-dicarboxylic acid** (LIMPRICHT and LACH), A., i, 32.
- 2:2-Dihydroxyflavone** and its diacetyl derivative (v. KOSTANECKI and SKI-FART), A., i, 668.
- 3:3-Dihydroxyflavone** and its diacetyl derivative (v. HARPE and v. KOSTANECKI), A., i, 237.
- 6:3-Dihydroxyflavone** and its diacetyl derivative (BLUMSTEIN and v. KOSTANECKI), A., i, 448.
- Dihydroxylamine derivatives**, non-existence of (DIVERS and HAGA), T., 437; P., 1900, 54.
- Dihydroxylaminesulphonates**, non-existence of (DIVERS and HAGA), T., 437; P., 1900, 54.
- 3:5-Dihydroxyanisole hydrochloride**, 2:4-diamino- and its tetraacetyl derivative (WEIDEL and POLLAK), A., i, 290.
- 2:7-Dihydroxy-8-methoxy-3-o-methoxyphenylquinoline** (PSCHORR), A., i, 234.
- 4:7(?) Dihydroxy-2-methylquinoline** and its diacetyl derivative (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- Dihydroxynaphthalene**, 1:2- and 1:4- derivatives of (RUSSIG), A., i, 601.
- 1:2-Dihydroxynaphthalene-3-carboxylic acid** and its diacetyl derivative (RUSSIG), A., i, 602.
- 1:4-Dihydroxynaphthalene-2-carboxylic acid** and its acetyl derivative (RUSSIG), A., i, 601.
- Dihydroxy-β-naphthaquinone**. See Naphthazarin.
- 3:4-Dihydroxyphenanthrene**. See Morphol.
- p-Dihydroxyphthalimide** (THIELE and MEISENHEIMER), A., i, 299.
- 2:6-Dihydroxypyridine-4-carboxylic acid**. See Citrazinic acid.
- 2:6-Dihydroxypyridine-3:4-dicarboxylic acid**, ethyl ester (RUHEMANN and STAPLETON), T., 243; P., 1900, 12.
- 2:6-Dihydroxypyrimidine**, 4-mono- and 4:5-di-amino- (TRAUBE), A., i, 416.
- Dihydroxystearic acid**, action of fused potash on (LE SUEUR), P., 1900, 91.
- 3:5-Dihydroxytoluene**. See Orcinol.
- Dihydroxytrimesic acid** (resorcinol-1:3:5-tricarboxylic acid), and its esters (ERRERA), A., i, 34.
- Dihydroxy-o-xylene**, tribromo-, and its acetyl derivatives (AUWERS and ERG-GELET), A., i, 98.
- Dihydroxy-m-xyloquinone** (BRUNN-MAYR), A., i, 292.
- Diindone-acetic acid**, -acetone, -acetophenone, and -benzoylacetone (SCHLOSSBERG), A., i, 665.
- Diindone-cyanoacetic acid** and -malononitrile (SCHLOSSBERG), A., i, 666.
- Diketobutyrolactone**, osazone, phenylhydrazone, and phenylhydrazoxime of (WOLFF and LÜTTRINGHAUS), A., i, 584.
- 1:3-Dikohydrindene** and its nitrosite (SCHMIDT), A., i, 299.
- Diketones**, electro-synthesis of (HOFER), A., i, 276.
- α-Diketones**, conversion of ketones into (PONZIO), A., i, 588.
- β-Diketones**, cyclic (LESER), A., i, 430.
- halogen-substituted indone derivatives of (LANSER and WIEDERMANN), A., i, 666.
- halogen-substituted α-naphthaquinolyl derivatives of (MICHEL), A., i, 669.
- halogen-substituted β-naphthaquinolyl derivatives of (HIRSCH), A., i, 670.
- 2:5-Diketotetrahydrothiazole** (WHEELER and BARNES), A., i, 565.
- α-Diketoximes**, characterisation of, by their diacetyl derivatives (PONZIO), A., i, 588.
- Di-2:6-lutidyl-4 sulphone** (MARCKWALD, KLEMM, and TRABERT), A., i, 457.
- Dilution law**. See Affinity.
- Dimethylamine** and its nitrosoamine (KIJNER), A., i, 279.
- Dimesityl**. See s-Tetramethyldibenzyl.
- Dimesitylodonium hydroxide and salts** (WILLERBODT and ROGGATZ), A., i, 432.
- 3:5-Dimethoxybenzoic acid**, ethyl ester, nitro- and amino- (EINHORN), A., i, 441.
- 3:5-Dimethoxycarbonyl-2-aminophenol** (WEIDEL and POLLAK), A., i, 290.
- o-Dimethoxydiphenyltetrahydroxyronoxime** and its compounds (PETRENKO-KRITSCHENKO), A., i, 306.
- 2:6-Dimethoxy-4-methylpyrimidine** (GABRIEL and COLMAN), A., i, 53.

- 1:4-Dimethoxynaphthalene (RUSSIG), A., i, 602.
- 2:3-Dimethoxyphenanthraquinone and its dibromo-derivative (PSCHORR and BUCKOW), A., i, 489.
- 2:3-Dimethoxyphenanthrene, synthesis of, and its dibromo-derivative and 9-carboxylic acid (PSCHORR and BUCKOW), A., i, 489.
- 3:4-Dimethoxyphenanthrene, synthesis of, and its 9-carboxylic acid (PSCHORR and SUMULEANU), A., i, 487.
- identity of, with dimethylmorphol (VONGERICHTEN), A., i, 488.
- 3:5-Dimethoxyphenol hydrochloride, 2- and 4-amino- (WEIDEL and POLLAK), A., i, 290.
- 5:6-Dimethoxy-3-phenyl-1-carbostyryl (PSCHORR and BUCKOW), A., i, 489.
- 7:8-Dimethoxy-3-phenylcarbostyryl (PSCHORR and SUMULEANU), A., i, 487.
- o*-Dimethoxyphthalic acid. See *Meta*-hemipinic acid under Hemipinic acid.
- 3:5-Dimethoxy-*o*- and -*p*-quinoneoximes (WEIDEL and POLLAK), A., i, 290.
- 3:4-Dimethoxystilbene, 2-nitro- (PSCHORR and SUMULEANU), A., i, 487.
- Dimethyl sulphate, alkylation by means of (ÜLLMANN and WENNER), A., i, 619.
- sulphide-mercuric iodide (SMILES), T., 164; P., 1899, 240.
- Dimethylacetyl sulphine iodide and platinichloride (STRÖMHOLM), A., i, 326.
- Dimethylacetoacetic acid, ethyl ester, hydrolysis of (GOLDSCHMIDT and OSLAN), A., i, 373.
- Dimethylacetylacetonitrile (HENRY), A., i, 538.
- Dimethylacridinium hydroxide (HANTZSCH and KALE), A., i, 114.
- Dimethylallylcarbinol, hydrocarbon, C_8H_{16} , from (LUBARSKY), A., i, 422.
- Dimethylallylmalonic acid, ethyl ester, nitrosate of (IPATIEFF), A., i, 3.
- "Dimethylamarine." See Benzoyl-*s*-dimethyl-*i*-diphenylethylenediamine.
- Dimethylamine cadmium haloids (RAGLAND), A., i, 141.
- hydrochloride and hydrobromide, compounds of, with tellurium halogen salts (NORRIS and MOMMERS), A., ii, 537.
- tin haloids (COOK), A., i, 142.
- 2-Dimethylaminocanthraquinone, 5:6-dichloro- (SEVERIN), A., i, 450, 598.
- Dimethylaminobenzene-6-azoquinoline (KNEUPPEL), A., i, 188.
- 2'-Dimethylaminobenzoylbenzoic acid, 3:4-dichloro-, and its esters (SEVERIN), A., i, 296, 445, 450.
- 2'-Dimethylaminobenzylbenzoic acid, 3:4-dichloro- (SEVERIN), A., i, 445, 450.
- p*-Dimethylaminobenzyl-*p*-toluidine (COHN and FISCHER), A., i, 690.
- Dimethyldiaminochlorophenazine (COHN and FISCHER), A., i, 459.
- Dimethylaminodimethylpyrazolone. See Pyramidone.
- 4'-Dimethylaminodiphenylmethane, 4-amino- (COHN and FISCHER), A., i, 691.
- 3-Dimethylaminoflavinduline salts, 2-amino- (KEHRMANN and STOFFEL), A., i, 254.
- 7-Dimethylamino-4-methylcoumarin and -3-ethylcoumarin (v. PECHMANN; v. PECHMANN and SCHAAL), A., i, 173.
- 6-Dimethylamino-3-methylcoumarone and -coumarilic acid (v. PECHMANN; v. PECHMANN and SCHAAL), A., i, 173.
- 4-Dimethylaminophenyl-4-*mono*- and -2':4'-*di*-amino-*m*-tolylmethane (COHN and FISCHER), A., i, 691.
- 4-Dimethylaminophenyl- μ -cyanoazo-methine-carboxylamide, and -carb-oxylonitrile (SACHS), A., i, 362.
- 9-Dimethylamino-7-phenylnaphthazene-azanium salts, 10-amino- (KEHRMANN and VALENCIEN), A., i, 255.
- Dimethylaminophenyl-methyl- and ethyl-sulphones (MICHAELIS and SCHINDLER), A., i, 215.
- aa*-Dimethyl- α -isocamylsuccinic acid, preparation and dissociation constant of (BONE and SPRANKLING), T., 1306; P., 1900, 184.
- Dimethylaniline, action of cyanogen bromide on (SCHOLL and NÖRR), A., i, 485.
- action of methyl chloroacetate on (CENSI), A., i, 363.
- nitration of (VAN ROMBURGH), A., i, 214.
- action of thionyl chloride on (MICHAELIS and SCHINDLER), A., i, 215.
- stannochloride (RICHARDSON and ADAMS), A., i, 151.
- Dimethylaniline, nitroso-, compound of, with tetramethyldiaminodiphenylmethanesulphone (SACHS), A., i, 362.
- o*-Dimethyl-anthranol and -anthraquinone (LIMPRICHT), A., i, 599.
- 2:4-Dimethylbenzaldazine and its reduction (CURTIUS), A., i, 612.

- Dimethylene-galactonic and -xylonic acids** (CLOWES and TOLLENS), A., i, 205.
- Dimethylenimine** (MARCKWALD), A., i, 336.
- Dimethyl-3- and -2-ethylindolenines**, 1:3- and 2:3-, action of methyl iodide on (PLANCHER), A., i, 560.
- 1:3-Dimethyl-3-ethyl-2-methylenindoline** and its hydriodide (PLANCHER), A., i, 561.
- $\alpha\alpha$ -Dimethyl- α_1 -ethylsuccinic acid**, preparation and dissociation constant of (BONE and SPRANKLING), T., 1305; P., 1900, 184.
- Dimethylethylsulphine iodide** (STRÖMHOLM), A., i, 326.
- iodide mercuric iodide (SMILES), T., 162, 167; P., 1899, 240.
- Dimethylfulvene** (THIELE), A., i, 299.
- Dimethylfumaric acid** (butylenedicarboxylic acid), from dimethylmaleic anhydride (MOLINARI), A., i, 374.
- $\alpha\alpha$ -Dimethylglutaconic acid** (pentylenedicarboxylic acid), synthesis of (CONRAD), A., i, 475.
- $\alpha\beta$ -Dimethylglutolactonic acids**, *cis*- and *trans*-, and their nitriles (BLAISE), A., i, 474.
- $\alpha\alpha'$ -Dimethylglutaric acids** (pentanedicarboxylic acids) (THORPE), T., 933; (HOWLES, THORPE, UDALL, and NEALE), T., 948; P., 1900, 116.
- $\beta\beta$ -Dimethylglutaric acid** (pentanedicarboxylic acid), $\alpha\alpha'$ -dibromo-, ethyl ester, condensation of, with ethyl sodiomalonate (PERKIN, THORPE, and WALKER), P., 1900, 149.
- Dimethylcyclohexanecarboxylic acid** (hexahydroxylic acid) and its isomeride (LEES and PERKIN), P., 1900, 20.
- $\gamma\delta$ -Dimethyl- β -hexenoic acid** (oclenoic acid) and its ethyl ester (BLAISE), A., i, 330.
- Dimethylhippuroflavin.** See Toluroflavin.
- 1:1-Dimethyl-2-methylenepyrrolidinium hydroxide** and salts (WILLSTÄTTER), A., i, 249.
- Dimethylmorphol.** See 3:4-Dimethoxyphenanthrene.
- Dimethyl- α - and - β -naphthylamines** and the action of formaldehyde on (MORGAN); T., 822; P., 1900, 131.
- $\beta\delta$ -Dimethyloctane- ϵ -olide** and its isomeride (V. BAEYER and SEUFFERT; V. BAEYER and VILLIGER), A., i, 132, 133.
- Dimethylol-5-methylacridine** (KOENIGS), A., i, 190.
- Dimethylsotetrazine** (dimethyldihydro-1:2:3:4-tetrazine), and its benzoyl derivatives (V. PECHMANN and BAUER), A., i, 314.
- $\beta\delta$ -Dimethyl- $\beta\delta$ -pentadiene.** See Heptinene.
- $\beta\delta$ -Dimethylpentane.** See Heptane.
- Dimethylphenomorpholone** (BISCHOFF), A., i, 346.
- Dimethylphenonaphthacridinium salts**, amino- ("aminodimethylnaphthacridinium" salts) (ULLMANN and NAEF), A., i, 689.
- Dimethyl-1:2:3:5-pentetrol**, preparation of, and its tetracetyl derivative (BRUNNMAYER), A., i, 291.
- Dimethylphloroglucinol**, bromo-, and its triacetyl derivative (HERZIG, POLLAK, and ROHM), A., i, 595.
- nitroso- and amino- and its pentacetyl derivative (BRUNNMAYER), A., i, 292.
- 1:1-Dimethylpiperidine**, action of halogens on (WILLSTÄTTER), A., i, 249.
- 2:4-Dimethylpiperidine** (2:4-lupetidine), decomposition of, into its optical isomerides (ENGELS), A., i, 406.
- Dimethylpropandiol.** See Dihydroxydimethylpropane.
- 4:4-Dimethyl-5-isopropylpyrazoline**, and its acetyl and benzoyl derivatives (FRANKE), A., i, 212.

- αα*-Dimethyl-*α*,*γ*- and -*iso*-propylsuccinic acids**, preparation and dissociation constant of (BONE and SPRANKLING), T., 1805; P., 1900, 184.
- 2:6-Dimethylpyrazine**, absorption spectrum of (HARTLEY and DOBBIE), T., 846; P., 1900, 129.
- 2:6-Dimethylpyridine** (*lutidine*), 3:5-diamino- (MOHR), A., i, 409.
- 3-chloro- and 3-bromo-, and their salts (BOCCHI), A., i, 357.
- 2:6-Dimethylpyridine-3:5-dicarboxylic acid**, diethyl ester, conversion of, into 3:5-diaminolutidine (MOHR), A., i, 409.
- 2:6-Dimethylpyridyl 4-mercaptan**, 4-methosulphide, sulphides, and acetyl sulphide and its oxime (MARCKWALD, KLEMM, and TRABERT), A., i, 457.
- 2:6-Dimethylpyridyl-4-methylsulphone**, and 4-sulphonic acid (MARCKWALD, KLEMM, and TRABERT), A., i, 457.
- Dimethylpyrone**, action of sodium ethoxide on (COLLIE and STEELE), T., 970; P., 1900, 146.
- action of iodine on the barium and sodium salts of, and its periodide (COLLIE and STEELE), T., 1114; P., 1900, 164.
- Dimethylpyronedicarboxylic acid**, ethyl ester, reduction of, and the action of semicarbazide on (OLIVERI-TORTORICI), A., i, 552.
- Dimethylpyrrolines**, action of bromoform and chloroform on (BOCCHI), A., i, 357.
- Dimethylstyrene**, 2:4- and 2:5-, *αβ*-dichloro- (KUNCKELL and GOTSCH), A., i, 639.
- αα*-Dimethylsuccinic acid** and anhydride (PERKIN, THORPE, and WALKER), P., 1900, 149.
- αα*-Dimethylsuccinic acids**, preparation and dissociation constants of (BONE and SPRANKLING), T., 1204; P., 1900, 184.
- Dimethyltetroxan**, hexabromo- (PINNER), A., i, 427.
- αα*-Dimethylthionine** and its salts (SCHAFOSCHNIKOFF), A., i, 524.
- Dimethyltoluenesammonium silver iodide** (ROSER), A., i, 51.
- 3:5-Dimethyl-1:2:4-triazole**, synthesis of, and its hydrochloride and nitrate (SILBERRAD), T., 1187; P., 1900, 169.
- αα*-Dimethyltricarballic acid**, and the ethyl ester of the *β*-cyano-derivative, synthesis of (HALLER and BLANC), A., i, 475.
- 4-Dimethyltrimethylenedicarbonimide**, 3:5-dicyano- (GUARESCHI and GRANDE), A., i, 111.
- Dimethyltrioxin**, hexabromo- (PINNER), A., i, 427.
- β-Dimethyluracil** (BEHREND and DIETRICH), A., i, 120; (BEHREND), A., i, 287.
- Dimethylvinylideneoxanilide** (v. PECHMANN and ANSEL), A., i, 287.
- Dimethylxylidines**, isomeric, methiodides of (FISCHER and WINDAUS), A., i, 224.
- Dimorphism** of cyanocamphor and its chloro- and bromo-derivatives (LAPWORTH), T., 1059; P., 1900, 128.
- Dimorphous substances**, monotropic, determination of the transition temperature of (SCHENCK), A., ii, 465.
- Dinaphthanthracene**, $C_{22}H_{14}$ (RUSSIG), A., i, 602.
- β-Dinaphtholmethane**, dinitroso-, Abel's. See *β*-Naphthol, *α*-nitroso-.
- αα*-Dinaphthoxyethane** (FOSSE), A., i, 298.
- 1:1'-Dinaphthyl**, 4:4'-diiodo-, and its reactions (WILLGERODT and SCHLÖSSER), A., i, 282.
- α*-Dinaphthylbenzidine**, action of tetramethyldiaminobenzophenone on (MERZ and STRASSER), A., i, 314.
- s*-Dinaphthylcarbamides**, *α*- and *β*- (VITTENET), A., i, 153.
- ββ*-Dinaphthylcarbaside** (CAZENEUVE and MOREAU), A., i, 196.
- Dinaphthyl-*m*- and -*p*-phenylenediamines**, *α*- and *αβ*- (MERZ and STRASSER), A., i, 253.
- Diocetylamine** and its nitroso-compound (KIJNER), A., i, 278.
- Dionine**. See Morphine ethyl ether.
- 2:6-Dioxy-4-dimethylpiperidine** and its derivatives (GUARESCHI and GRANDE), A., i, 112.
- 2:6-Dioxy-4-methyl-4-hexylpiperidine**, and its derivatives (GUARESCHI and GRANDE), A., i, 112.
- 2:6-Dioxy-4-methyl-4-*n*- and -*iso*-propylpiperidines** (*ββ*-methyl-*n*- and -*iso*-propylglutarimides), 3:5-dicyano- and their salts and derivatives (MINOZZI), A., i, 407.
- 2:5-Dioxy-4-methylpurine**, 7-amino-, and 7-chloro-, and their derivatives (FISCHER and ACH), A., i, 64.
- Diphenacetyl tartaric acid**, diethyl ester, rotation of (McCRAE and PATTERSON), T., 1096; P., 1900, 161.
- Diphenacylacetic acid**, *γ*-lactone of (KLOBB), A., i, 406.
- s*-Diphenethylcarbamide** (THIELE and PICKARD), A., i, 30.
- Di-*p*-phenetidinophosphoric acid** (AUTENRIETH and RUDOLPH), A., i, 570.
- Diphenetylisothiocarbamide**, acyl derivatives (HUGESHOFF), A., i, 156.
- αα*-Diphenoxyethane** (FOSSE), A., i, 298.

- $\text{CH}_3(\text{SO}_2\text{R})_2$, action of formaldehyde on (KÜTZ), A., i, 370.

Di-*p*-toluenesulpheno-methylpiperaside and -propylenediamine (ESCH and MARCKWALD), A., i, 336.

Di-*o*-, -*m*-, and -*p*-tolylethylenediamines, their nitro-derivatives, nitrates, and mercurichlorides (MILLS), T., 1020 ; P., 1900, 127.

Ditolyl ethylene diketone. See Succitoyl ketone.

Di-*o*- and -*p*-tolylguanidines, amino-, reactions of (BUSCH and BAUER), A., i, 415.

Di-*m*-tolylmethane, 2:2':4'- and 4:2':4'-tri-amino- (COHN and FISCHER), A., i, 690.

Di-*m*- and -*p*-tolylmethylenedihydroxylamine (BAMBERGER), A., i, 342.

Ditolylsuccinide (LIMPRICHT), A., i, 600.

Di-*o*- and -*p*-tolylisothiocarbamides, acyl derivatives (HUGERSHOFF), A., i, 156.

Ditrimethylenetetrasulphone
 $\text{CH}_2(\text{CH} \begin{smallmatrix} \text{SO}_2 \text{CH}_2 \\ \text{SO}_2 \text{CH}_2 \end{smallmatrix}) \text{CH}_2)_2$ (KÜTZ), A., i, 370.

Diuretics and its relation to the changes in the composition of blood after transfusion of sodium chloride (MAGNUS), A., ii, 665.

Dixenylamine, diamino- (diaminotetraphenylamine) (MERZ and STRASSER), A., i, 313.

***m*-Dixylylcarbamides, dinitro-**
 $[\text{NH}:\text{NO}_2 = 4:5 \text{ and } 4:6]$ (VITTENET), A., i, 158.

***m*-Dixylylene, $\text{C}_{18}\text{H}_{16}$** (PELLEGRIN), A., i, 151.

Di-*p*-xylyl-*o*-methylenedihydroxylamine (BAMBERGER), A., i, 342.

Dogs. See Agricultural Chemistry.

Dolerite from New Jersey (PHILLIPS), A., ii, 27.

Dolomite, phosphorescent, from Elba (D'ACHIARDI), A., ii, 661.

Dopplerite from Oldenburg (CLAESSEN), A., ii, 20.

Dressings, surgical, estimation of corrosive sublimate in (LEHMANN), A., ii, 443, 511; (UTZ), A., ii, 722.

estimation of iodoform in, volumetrically (LEHMANN), A., ii, 372, 767.

Drugs, new; aromatic hydroxy acids and esters (EINHORN), A., i, 439.

glucinyll derivatives of the esters of aromatic amino- and hydroxy-amino-acids (EINHORN and OPPENHEIMER), A., i, 493.

chemical behaviour of, in the organism (FRÄNKEL), A., ii, 423.

containing alkaloids, alkalimetric method for the valuation of (GORDIN), A., ii, 777.

Dulcitol in the bark of *Euonymus alatus* (HOEHNEL), A., ii, 427.

Duryluric acid. See 2:4:5-Trimethylhippuric acid.

Dypnone, distillation of (AMEYE), A., i, 35; action of potassium hydroxide on (GESCHÉ), A., i, 604.

action of zinc ethyl and of heat on (DELACRE), A., i, 603.

Dypnopinalcolene (DELACRE), A., i, 603.

E.

Earth, edible, from Fiji (CORNEY, DAVID, and GUTHRIE), A., ii, 569.

Earths, rare, new spectra of the (DEMARÇAY), A., ii, 656.

luminescence spectra of the (MUTHMANN and BAUER), A., ii, 544.

molecular susceptibility of salts of the (MEYER), A., ii, 7, 186; (DU BOIS and LIEBKNECHT), A., ii, 127, 333.

new method of fractionating some (DEMARÇAY), A., ii, 347.

separation of the (MUTHMANN and BÖHM), A., ii, 209; (URBAIN; CHAVASTELON), A., ii, 346.

See also Cerite metals.

Egonines, *d*- and *l*-, oxidation of (WILLSTÄTTER and BODE), A., i, 245.

Echinopsine and its salts (GRESHOFF), A., i, 556.

Edestin, metabolism with (LEIPZIGER), A., ii, 223.

basic decomposition products of (LEVEENE), A., i, 318.

Effusion, phenomena of, of permanent gases (EMDEN), A., ii, 10.

relative rates of, of argon, helium, and other gases (DONNAN), A., ii, 390.

Effusions, milky serous (SHAW), A., ii, 229.

Egg-albumin. See Albumin.

Eggs, echinoid, chemical fertilisation of (LOEB), A., ii, 555, 608; (VIGNIER), A., ii, 608.

hens', composition of (JUCKENACK), A., ii, 290.

diastatic ferment in (MÜLLER and MASUYAMA), A., ii, 420.

chemical changes in the developing (LEVEENE), A., ii, 290.

Egg-white, proteids of (OSBORNE and CAMPBELL), A., i, 574.

Egg-yolk, proteids of (OSBORNE and CAMPBELL), A., i, 616.

detection of, in margarine (MECKE), A., ii, 123.

Ehlite. See Phosphorocalcite.

Ehrlich's diazo-reaction (BRIEGER), A., i, 316; (CLEMENS), A., ii, 227; (WESENBERG), A., ii, 776.
 for the recognition of some morphine derivatives (CARCANO), A., ii, 776.

Elaidic acid, formation of, and action of dilute nitric acid on (EDMED), P., 1899, 190.

Elastin, proportion of basic nitrogen in (EUSTIS), A., i, 317.

ELECTROCHEMISTRY :—
Electrochemistry, quantitative lecture experiments on (MILLER and KENRICK), A., ii, 703.

Accumulators, lead, theory of (DOLEZALEK), A., ii, 2; (MUGDAN), A., ii, 463.
 gaseous polarisation in (NERNST and DOLEZALEK), A., ii, 641; (STRASSER and GAHL), A., ii, 642.

Cell, aluminium (NORDEN), A., ii, 404; (MORGAN and DUFF), A., ii, 588.
 new electrolytic, for rectifying alternating currents (HILDBURGH), A., ii, 520.
 chromium, for the rectification of alternating currents (MORGAN and DUFF), A., ii, 588.

Clark, thermodynamics of (COHEN), A., ii, 520, 703.
 inversion of hexa- and heptahydrates of zinc sulphate in the (BARNES), A., ii, 254.
 concentration, with unalterable electrodes (SCHAUM), A., ii, 2.
 gas, theory of (BOSE), A., ii, 704.
 grey tin | solution of a tin salt | white tin (COHEN), A., ii, 183.
 transition, of the third kind, theory of (COHEN), A., ii, 184.
 voltaic, reversibility of (MOORE), A., ii, 381.

Weston (COHEN), A., ii, 702, 703; (JAEGER and LINDECK), A., ii, 703.
 as a transition cell, and its ratio to a Clark cell (BARNES), A., ii, 520.

Conductivity, conditions under which substances possess (ABEGG), A., ii, 5.
 determination of, with direct current instruments (MORGAN and HILDBURGH), A., ii, 521.
 in gases traversed by cathode rays (MCLENNAN), A., ii, 587.
 and internal friction in saline solutions (MASSOULIER), A., ii, 331.

ELECTROCHEMISTRY :—

Conductivity, specific gravity and surface tension of aqueous solutions containing potassium chloride and sulphate (BARNES), A., ii, 332.
 of acids, apparatus for measuring the (WALKER and CORMACK), T., 5; P., 1899, 208.
 of saturated fatty acids (BILLITZER), A., i, 7.
 of alkali chlorides and nitrates (KOHLEBAUSCH and MALTBY), A., ii, 61.
 of dilute amalgams, influence of temperature on (LARSEN), A., ii, 255.
 of liquid ammonia solutions (FRANKLIN and KRAUS), A., ii, 382.
 of a solution of ammonia, change of the, on the addition of salts (KONOWALOFF), A., ii, 266.
 of azoimide (WEST), T., 707; P., 1900, 74.
 of benzoic acid, influence of substituents on the (TINGLE), A., ii, 6.
 of caesium (ECKARDT and GRAEFFE), A., ii, 479.
 of aqueous solutions of hydrochloric and sulphuric acids (BARNES), A., ii, 522.
 of the sodium salts of hydroxymethane-, hydroxyethane-, and hydroxypentane-sulphonic acids (COJAZZI), A., i, 327.
 of some sodium derivatives of nitro-paraffins (SULC), A., ii, 332.
 of platinum tetrachloride solutions (MIOLATI), A., ii, 214.
 of compressed powders (STREINTZ), A., ii, 641.
 of saturated solutions (DAWSON and WILLIAMS), A., ii, 383.
 of non-aqueous solutions of inorganic salts (LINCOLN), A., ii, 6.
 of double thiocyanates and cyanides (WALDEN), A., i, 430.
 of animal juices and tissues (OKER-BLOM), A., ii, 290, 356, 607.

Current density, relation between polarisation and, in solid and fused salts (GOCKEL), A., ii, 704.

Current, metallic crystallisation by the (TOMMASINA), A., ii, 185; (TOMMASI), A., ii, 339.
 constant, action of, on the respiration of "surviving" muscle (GUILLLOZ), A., ii, 221.

Contact breaker, new (MORGAN), A., ii, 255.

ELECTROCHEMISTRY :—

- Dielectric constant**, method of determining (COOLIDGE), A., ii, 3.
 of hydrogen peroxide (CALVERT), A., ii, 331.
- Electrocapillary phenomena**, nature of (SMITH), A., ii, 330.
- Electromagnetic theory**, validity of Maxwell's equations relating to (WEDELL-WEDELLSBORG; SCHEYE), A., ii, 254.
 refutation of Poynting's theorem relating to (WEDELL-WEDELLSBORG), A., ii, 519.
 an application of Poynting's theorem (MIE), A., ii, 703.
- Electrification of electrolytic gases** (KÖSTERS), A., ii, 4.
- Electric charge of the deviable rays of radium** (P. and S. CURIE), A., ii, 254.
- Electric discharge**, silent, chemical effects of the, compared with the chemical action of light (BEETHLOT), A., ii, 329.
 in nitrogen, fluorescence and after-glow accompanying an (LEWIS), A., ii, 702.
- Electrical effects** due to the evaporation of sodium in air and other gases (HENDERSON), A., ii, 588.
- Electrical resistance**, method of determining (COHEN), A., ii, 188.
 change of, of lead dioxide (SUNDORFF), A., ii, 5.
 of tellurium (LENHER and MORGAN), A., ii, 273.
- Electric oscillations**, transparency of liquids to (DE HEEN), A., ii, 524.
- Electrical properties of metals**, influence of light on the (BUISSON), A., ii, 519.
- Thermo-electrical properties of alloys** (STEINMANN), A., ii, 523, 524.
- Electrical waves** (COOLIDGE), A., ii, 3.
- Electrochemical equivalent of carbon** (PEASE), A., ii, 257; (SKINNER), A., ii, 523.
 of copper and silver (RICHARDS, COLLINS, and HEIMROD), A., ii, 256.
- Electrochemical properties of silver fluoride and of fluorine** (ABEGG and IMMERWAHR), A., ii, 256.
- Electrode**, metallic deposition by electrical transport from one, to the other (TOMMASINA), A., ii, 185.
- Electrodes**, new, for electrolytic estimations (HOLLARD), A., ii, 435.
 reversible, of the second order, potential of, with mixed depolarisers (THIEL), A., ii, 521.

VOL. LXXVIII. ii.

ELECTROCHEMISTRY :—

ELECTROCHEMISTRY :—

- Electrolysis** of aniline and nitrobenzene (MÖLLER, A., i, 27.
- of azo- and of nitrobenzene (LÖB, A., i, 697 ; ii, 706.
- of ethyl potassium diethoxysuccinate (BROWN and BOLAM, A., i, 201.
- of solutions of sucrose (ULSCH, A., i, 15.
- Electrolytes**, coagulative power of (WHETHAM, A., ii, 62.
- relation between heat of solution and solubility of (VAN LAAR, A., ii, 708.
- depression of the freezing point by mixtures of (BARNES), A., ii, 526.
- highly dissociated, degree of dissociation and dissociation equilibrium of (JAHN), A., ii, 522, 707.
- finding the composition of mixed, when the degree of dissociation is given (MACGREGOR, A., ii, 332.
- Non-electrolytes**, freezing point of aqueous solutions of (LOOMIS, A., ii, 335.
- Electrolytic dissociation** of acids and bases and heat of neutralisation (THIEL, A., ii, 260.
- of very weak inorganic acids (WALKER and CORMACK, T., 5 ; P., 1899, 208.
- of aqueous solutions of two electrolytes with one common ion (MACGREGOR, A., ii, 62.
- of certain salts in methyl and ethyl alcohols by the boiling point method (JONES, A., ii, 187.
- of solutions of potassium and sodium sulphates tested by freezing point determinations (ARCHIBALD, A., ii, 65.
- Electrolytic decomposition point** of aqueous solutions (GÖCKEL, A., ii, 332.
- Electrolytic deposition** of metals from non-aqueous solutions (KAHLENBERG), A., ii, 521.
- of brass (MORGAN, A., ii, 345.
- of chromium (COWPER-COLES), A., ii, 408.
- Electrolytic formation** of chlorates and hypochlorites (FOERSTER), A., ii, 72, 400 ; (MÜLLER, A., ii, 73 ; (BROCHET, A., ii, 205, 276, 541, 706 ; (FOERSTER and JORKE), A., ii, 343 ; (WOLF, A., ii, 382 ; (WOHLWILL), A., ii, 400, 471 ; (SIEVERTS), A., ii, 470 ; (LORENZ and WEHRLIN), A., ii, 476 ; (FOERSTER and SONNEBORN), A., ii, 645.

ELECTROCHEMISTRY :—

- Electrolytic preparation** of benzidine (LÖB, A., i, 697 ; ii, 706.
- of induline dyes (SZARVASY), T., 207 ; P., 1899, 194.
- of colouring matters resembling indulines (LÖB, A., i, 464.
- Electrolytic modification** of Sandmeyer's and Gattermann's reactions (VOTOČEK and ZENFSEK), A., i, 19.
- Electrolytic oxidation** of ketoximes (SCHMIDT, A., i, 332.
- of succinic acid (CLARKE and SMITH), A., i, 77.
- Electrolytic reduction** (LÖB, A., ii, 706.
- of difficultly reducible substances in sulphuric acid solution (TAFEL), A., ii, 588.
- of nitrobenzene (HABER, A., i, 281 ; ii, 257 ; (HABER and SCHMIDT), A., ii, 282.
- of *p*-nitroacetanilide (SONNEBORN), A., i, 464.
- of *m*-nitrotoluene (ROHDE), A., i, 20.
- of succinimides (TAFEL and STERN), A., i, 557.
- Electrolytic synthesis** of iodoform (DONY-HÉNAULT), A., i, 577.
- of ketones and diketones (HOFER), A., i, 275.
- of organic substances (DONY-HÉNAULT), A., ii, 644.
- Electrolytic solution pressure**, theory of (LEHFELDT, A., ii, 62 ; (KRÜGER ; NEHNST), A., ii, 706.
- Electromotive behaviour** of substances with several stages of oxidation (LUTHER), A., ii, 705.
- of chromium (HITTOFF), A., ii, 127 ; (MORGAN and DUFF), A., ii, 589.
- Electromotive efficiency** of the elementary gases (BOSE), A., ii, 704.
- Electromotive force** and chemical equilibrium (ROTHMUND), A., ii, 183 ; (DANNEEL), A., ii, 464.
- and diffusion velocity, influence of the addition of a salt with one similar ion on (ABEGG and BOSE), A., ii, 127.
- of cells containing red and yellow mercuric oxides (COHEN), A., ii, 184.
- of the Clark cell, change of (BARNES), A., ii, 254.
- of fused halogen compounds of heavy metals (LORENZ), A., ii, 61.
- Ions**, velocity of, produced in gases by Röntgen rays (ZELENY), A., ii, 587.
- migration and separation of, apparatus for illustrating the (MÜLLER), A., ii, 643.

ELECTROCHEMISTRY:—

- Migration constant** of sulphuric acid (KENDRICK), A., ii, 643.
- Ionic charges**, effect of the interaction of, on osmotic pressure (v. TÜBIN), A., ii, 712.
- Ionic mobility**, model to show (KOHLEKAUSCH), A., ii, 712.
- Ionisation** of complex solutions of given concentration, finding the, and the converse problem (MACGREGOR), A., ii, 332.
- Ion concentrations** in solutions of potassium, sodium, and hydrogen chlorides (JAHN), A., ii, 522, 707. in fused salts (LORENZ), A., ii, 61.
- Polarisation**, relation between current density and, in solid and fused salts (GOCKEL), A., ii, 704. in quantitative electrolytic determinations (MARSHALL), A., ii, 185. gaseous, in the lead accumulator (NERNST and DOLEZALEK), A., ii, 641; (STRASSER and GAHL), A., ii, 642.
- Potential** of reversible electrodes of the second order with mixed depolarisers (THIEL), A., ii, 521. discharge, of chlorine ions (MÜLLEK), A., ii, 643.
- Potentials**, oxidation (CROTOGINO), A., ii, 642. of copper electrodes in solutions (IMMERWAHR), A., ii, 642.
- Potential difference** with manganese dioxide electrodes (TOWER), A., ii, 331. between solutions in relation to electrocapillary phenomena (SMITH), A., ii, 330. between a platinum and an iodine electrode (KÜSTER and CROTOGINO), A., ii, 255. between a solid salt and its solution (CAMPETTI), A., ii, 704. of silver in solutions of its mixed halogen salts (KÜSTER and THIEL), A., ii, 255.
- Element**, new, in crude samarium oxide (DEMARÇAY), A., ii, 481.
- Elements**, etymological researches on the names of the (DIERGAART), A., ii, 59. relation of physical properties of, to atomic weights (SANDER), A., ii, 137; (BAYLEY), A., ii, 188. hardness of the (RYDBERG), A., ii, 392. estimation of, in organic compounds (BERTHELOT), A., ii, 172.
- Ellagic acid** from various tannin matters (PERKIN), T., 423.

- Elm galls**, gum in (PASSERINI), A., ii, 427.
- Embelic acid** and its dibenzoyl derivative (HEFFTER and FEUERSTEIN), A., i, 496.
- Emodin** and its constitution (HESSE), A., i, 40; (LIEBERMANN), A., i, 355. aloe- and frangula-, distinction between (OESTERLE), A., i, 304.
- Emulsin** in tobacco leaves (BEHRENS), A., ii, 239.
- Enantiotropy** of tin (COHEN and VAN EIJK), A., ii, 83, 212; (COHEN), A., ii, 212, 408.
- Endiolite** from Greenland (FLINK), A., ii, 412.
- Endlichite** from Hillsboro', New Mexico (GOLDSCHMIDT), A., ii, 600.
- Energy**, free, development and application of a general equation for (LEWIS), A., ii, 264. change of, in fused halogen compounds of heavy metals (LORENZ), A., ii, 61.
- Enzymes** (SACHAROFF), A., i, 268. action of, in resolving racemic compounds (FISCHEK), A., i, 140; (MARCKWALD and MCKENZIE), A., i, 207. effect of, on the germination of old seed (THOMSON), A., ii, 496. ammonia-forming, in the liver (JACOBY), A., ii, 672. amylolytic and proteolytic, in human faeces (HEMMETER), A., ii, 607. bacteriological, behaviour of, in disease (EMMERICH and LÖW), A., ii, 159. cellulose (NEWCOMBE), A., ii, 99. diastatic, in hens' eggs (MÜLLER and MASUYAMA), A., ii, 420. distribution of, in the potato plant and in oats (MAYER), A., ii, 427. indigo (BEYERINCK), A., i, 230, 403; (HAZEWINKEL), A., i, 403. inorganic (BREDIG and MÜLLER v. BERNECK), A., ii, 213. lipolytic, in human ascitic fluid (HAMBURGER), A., ii, 420. oxidising, decomposition of chlorophyll by (WOODS), A., ii, 234. in the vine (CORNU), A., ii, 102. oxidising and reducing, in the animal organism (ABELOUS and GÉRARD), A., i, 268. hydrogenating and reducing, in the organism (ABELOUS and GÉRARD), A., ii, 226. proteolytic, produced by *Aspergillus niger* (MALFITANO), A., ii, 493.

Enzymes, proteolytic, of malt (FERNBACH and HUBERT), A., i, 576, 616; (WINDISCH and SCHELLHORN), A., i, 712.
 occurrence and action of, in germinated seeds (BUTKEWITSCH), A., ii, 744.
 of germinating seeds (HARLAY), A., ii, 744.
 produced during the germination of seeds (BOURQUELOT and HÉRISSEY), A., ii, 35, 233.
 of the carob bean (BOURQUELOT and HÉRISSEY), A., i, 320; ii, 35, 233.
 of "koji" (KOZAI), A., ii, 743.
 formation of, characteristic, of yeasts (KLÖCKER), A., ii, 743.

- Evaporation**, relation between pressure and (HALL), A., ii, 9.
- Exalgin**, test for in antipyrine (RAIKOW and SCHARBANOW), A., ii, 456.
- Expansion of fused silica** (LE CHATELIER), A., ii, 539.
- Explosives**, use of ammonium perchlorate in the manufacture of (ALVISI), A., ii, 205.
relative stability of (BERTHELOT), A., i, 620.
- Explosive wave**, development and propagation of an (LE CHATELIER), A., ii, 647.

F.

- Fæces**, amylolytic and proteolytic fermenta in human (HEMMETER), A., ii, 607.
- xanthine bases in (PARKER), A., ii, 556.
- estimation of cellulose in (MANN), A., ii, 250.
- Fahlors.** See Tetrahedrite.
- Farmyard manure.** See Agricultural Chemistry.
- Fat**, formation of, in the organism by intensive feeding of fat (HENRIQUES and HANSEN), A., ii, 668.
human, composition and heat of combustion of (BENEDICT and OSTERBERG), A., ii, 491.
determination of the melting point of (JEAN), A., ii, 179.
transformation of, into glycogen (BORCHARD and DESGREZ), A., ii, 418.
rapidity of hydrolysis of (KREIS and WOLF), A., ii, 324; (LÜHRIG), A., ii, 667.
absorption of (HOFBAUER), A., ii, 605; (PFLÜGER), A., ii, 667; (FRIEDENTHAL), A., ii, 668.
rate of absorption and of assimilation of, during fasting (MOSSO), A., ii, 605.
absorption of, in the large intestine (HAMBURGER), A., ii, 418.
relative digestibility of certain, in the human intestine (LÜHRIG), A., ii, 224, 355, 667.

- Fat**, rancidity of (NAGEL), A., i, 271.
 apparatus for the extraction of (TAYLOR), A., ii, 115.
 in cartilage (SACERDOTTI), A., ii, 291.
 of human chyle, composition of (ERBEN), A., ii, 739.
 in glands (NIKOLAIDES), A., ii, 153.
 of normal and degenerated heart muscle (LINDEMANN), A., ii, 32.
 pathological (TAYLOR), A., ii, 606.
 from proteid (PFLÜGER), A., ii, 91, 92.
 meaning of the acetyl value in the analysis of (LEWKOWITSCH), A., ii, 323.
 bromine and iodine values of (WILLIAMS), A., ii, 633.
 the "inner saponification number" in the analysis of (FARRION), A., ii, 251.
 Welmans' phosphomolybdate test for the detection of (WELMANS; SOLTSEIN), A., ii, 697.
 detection of phytosterol and cholesterol in (KREIS and RUDIN), A., ii, 252.
 rapid estimation of the iodine number of (BELLIER), A., ii, 632.
 Hübl's iodine method for the estimation of (WELMANS), A., ii, 514.
 estimation of, in dairy produce (LINDERT), A., ii, 451.
 estimation of, in milk (TIMPE), A., ii, 179; (GALLIEN; MORINI; LÉZÉ), A., ii, 324; (RICHMOND), A., ii, 696.
 estimation of, in condensed milk (LEACH), A., ii, 771.
 estimation of, in sweetened condensed milk (GEISLER), A., ii, 771.
 estimation of, in sweetened condensed milk by the Babcock test (FARRINGTON), A., ii, 771.
 estimation of glycerol in (JEAN), A., ii, 694.
- Fats.** See also :—
 Butter.

- Fish oils**, analysis of (BULL), A., ii, 250, 325.
- Flames**, coal gas, properties of (TECLU), A., ii, 71.
- o-Flavaniline** (2-o-aminophenyl-4-methyl-quinoline) and its acetyl derivative (CAMPS), A., i, 115.
- Flavaspidic acid** (HAUSMANN), A., i, 49.
- Flavinduline**, *mono-* and 2:7-*di-nitro-* and *mono-* and 2:7-*di-amino-* and their salts (KEHRMANN and KIKINE), A., i, 61.
 bromide, *mono-* and 2:7-*di-amino-* (KEHRMANN and KIKINE), A., i, 61.
- Flavindulines**, *nitro-* and *amino-* and their salts (KEHRMANN and STOFFEL), A., i, 254.
- Flavone**, synthesis of (v. KOSTANECKI, TAMBOR, and BONGARTZ), A., i, 239.
 derivatives (v. HARPE and v. KOSTANECKI), A., i, 237; (v. KOSTANECKI and SCHMIDT), A., i, 238; (v. KOSTANECKI and TAMBOR), A., i, 239; (BLUMSTEIN and v. KOSTANECKI), A., i, 448; (CZAJKOWSKI, v. KOSTANECKI, and TAMBOR), A., i, 504.
- Flax**. See Agricultural Chemistry.
- Flesh** and **proteids**, energy-value of (PFLÜGER), A., ii, 417.
- Flocculation** of liquids (SPRING), A., ii, 713.
- Florenceite** from Brazil (HUSSAK and PRIOR), A., ii, 601; (PRIOR), A., ii, 602.
- Flour**, gluten constituents of (GUSS), A., ii, 584.
- Fluids**, specific heat of (AMAGAT), A., ii, 525.
- Fluoran**, *dichlorodithio-* and *dithio-* (MEYER; MEYER and SZANECKI), A., i, 660.
- Fluorene**, refraction of (CHILESOTTI), A., i, 339.
 condensation product of (THIELE), A., i, 347.
- Fluoreneoxalic acid** and its ethyl ester (WISLICENUS), A., i, 346.
- Fluorescein**, *nitro-*derivatives, preparation and constitution of (HEWITT and PERKINS), T., 1324; P., 1900, 178.
mono- and *di-thio-* (MEYER; MEYER and SZANECKI), A., i, 660.
- Fluorescence** and chemical constitution (HEWITT and PERKINS), T., 1324; P., 1900, 178; (HEWITT), P., 1900, 3; A., ii, 618.
 of metallic compounds under the influence of Röntgen and Becquerel rays (BARY), A., ii, 330.
- Fluorine** in Swedish phosphorites (ANDERSSON and SAHLBOM), A., ii, 148.
 presence of, in teeth and bones (HARMS), A., ii, 29.
 in the mineral waters of Spain and Portugal (FERREIRA DA SILVA and D'AGUIAR), A., ii, 28.
 electrochemical properties of (ABEGG and IMMERWAHR), A., ii, 256.
 action of, on glass (MOISSAN), A., ii, 140.
- Hydrofluoric acid** (*hydrogen fluoride*), volumetric composition of (MOISSAN), A., ii, 271.
 heat of dissociation of (ABEGG), A., ii, 190.
 action of, on glass (MOISSAN), A., ii, 140.
- Fluorohyperborates** (MELIKOFF and LORDKIPANTDZE), A., ii, 138, 139.
- Fluorine**, detection of, in wine (PARIS), A., ii, 572.
- Fodders**, König's process for the estimation of crude fibre free from pentosan in (KELLNER, HERING, and ZAHN), A., ii, 250.
 See also Agricultural Chemistry.
- Fœtus**, human, fixation of alkali bases in the, and mineral statics of the, during the last five months of intrauterine life (HUGOUNENQ), A., ii, 418, 490.
- Food**, horseflesh as (PFLÜGER), A., ii, 490.
 sugar as (STROHMER), A., ii, 490.
 detection of coal-tar colouring matters in (WINTON), A., ii, 776.
 detection of "saccharin" in (TRICHON), A., ii, 377; (DE BRÉVANS), A., ii, 635.
 estimation of absorbable proteids in (BÜLOW), A., ii, 459.
- Food preservatives**, boric acid and formaldehyde as (RIDEAL and FOULERTON), A., ii, 560; (HEHNER), A., ii, 561.
- Formaldehyde**, formation of (FENTON), T., 1297; P., 1900, 148.

- Formaldehyde**, formation of, in plants (POLLACCI), A., ii, 160, 426.
 action of, on acridine and quinoline derivatives, and on alkaloids (KOENIGS), A., i, 189.
 action of, on anilides (GOLDSCHMIDT), A., i, 285, 436.
 action of, on β -aromatic hydroxylamines (BAMBERGER), A., i, 341.
 condensation of, with ethyl malonate (BOTTOMLEY and PERKIN), T., 294; P., 1900, 16.
 action of, on methylaniline (GOLDSCHMIDT), A., i, 436.
 action of, on amines of the naphthalene series (MORGAN), T., 814; P., 1900, 131.
 action of, on *o*-nitroaniline (MEYER and ROHMER), A., i, 222.
 action of potassium cyanide on (KOHN), A., i, 205.
 and isobutaldehyde, an aldol from (WÄRMELY), A., i, 428.
 compounds of, with bromal (PINNER), A., i, 427.
 compounds of, with substances belonging to the sugar group (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.
 as a food preservative (RIDEAL and FOULERTON), A., ii, 560; (HEHNER), A., ii, 561.
 physiological action of (BRUNI), A., ii, 359.
 comparison of some tests for (PILHASY), A., ii, 453.
 detection of (POLLACCI), A., ii, 160.
 detection and estimation of (CLOWES and TOLLENS), A., ii, 56.
 estimation of (VEREIN FÜR CHEMISCHE INDUSTRIE IN MAINZ), A., ii, 326; (WOLFF), A., ii, 373.
 estimation of, in the air (WINTGEN), A., ii, 117.
Paraformaldehyde, reactions of (HENRY), A., i, 537.
Formaldehydphenylbenzylhydrazone (RUFF and OLLENDORFF), A., i, 77.
Formasylbensenesulphonic acids, sodium salts of (FICHTER and SCHIESS), A., i, 366.
Formhydroxamic acid (BIDDLE), A., i, 138.
Formhydroxamoxime dibenzyl ether, and *p-di*-bromo- and -chloro-, and their acetyl derivatives (SCHROETER and PESCHKES), A., i, 485.
Formic acid, mixed anhydrides of (BÉHAL), A., i, 580.
 new hydroxylamine derivatives of (SCHROETER and PESCHKES), A., i, 485.
 estimation of (BÉHAL), A., i, 581.
Formic acid, estimation of, in presence of acetic acid (SPARRE), A., ii, 449.
Formic acid, methyl and ethyl esters, heat of combustion and of formation of (BERTHELOT and DELÉPINE), A., ii, 334.
 propyl ester, rate of hydrolysis of, at various temperatures (PRICE), A., ii, 528.
Formopyrine (*diantipyrimethane*), tetraiodide of, and compounds of, with phenols (PATEIN), A., i, 530.
Formoxime acetate and benzoate, chloro- (BIDDLE), A., i, 138.
 nitrate (BAMBERGER and MÜLLER), A., i, 145.
2-Formylaminoanisole, 5-chloro- (DIEPOLDER), A., i, 191.
***o*-Formylaminophenol** (BÉHAL), A., i, 581.
Formylanilide, bromo- and chloro-derivatives, and their acetyl and benzoyl derivatives (CHATTAWAY, ORTON, and HURTLEY), A., i, 151.
o-bromo- and -chloro-, nitrogen bromides and chlorides from (CHATTAWAY and ORTON), T., 800.
o-mono- and 3:5-*di*-bromo- and -chloro- (CHATTAWAY and ORTON), A., i, 643.
Formyl-*o*-anisidide (DIEPOLDER), A., i, 191.
1-Formylnaphthalide, 4-bromo- (CHATTAWAY and ORTON), A., i, 643.
2-Formylnaphthalide, 1-chloro- (CHATTAWAY, ORTON, and HURTLEY), A., i, 152.
Formylphenylacetic acid, ethyl ester, α - and β - (BRÜHL), A., i, 497.
 melting point of (WOLF), A., i, 345.
 esters, isomerism of (WISLICENUS), A., i, 597.
Formylphenylhydrazide, nitroso-, and **Formylphenylbenzylidenetriazan** (WOHL), A., i, 698.
Fractional distillation in a vacuum, receiver for (FOGETTI), A., ii, 535.
 under reduced pressure, apparatus for (ODDO), A., ii, 131.
 lecture experiment for demonstrating (RAIKOW), A., ii, 648.
Fractional precipitation of neutral salts, theory of the (FINDLAY), A., ii, 716.
Frankia subtilis, an organism producing nodules (HILTNER), A., ii, 426.
Freezing point, abnormal depressions of the, produced by chlorides and bromides of the alkaline earths (JONES and CHAMBERS), A., ii, 262.
 depression of the, by mixtures of electrolytes (BARNES), A., ii, 526.

- Freezing point** of aqueous solutions of acetic acid (DAHMS; DE COPPET), A., ii, 65.
 of aqueous solutions of non-electrolytes (LOOMIS), A., ii, 335.
 of hydrates of sulphuric acid (v. BIRON), A., ii, 74.
 of water, minimum in the molecular lowering of, produced by acids and salts (CHAMBERS and FRAZER), A., ii, 526.
 in dilute solutions, method of determining (WILDERMANN), A., ii, 262.
 in dilute solutions, errors in the determination of (WILDERMANN), A., ii, 131, 191; (BATELLI and STEFANINI), A., ii, 709.
- Freezing point curves** of alloys of antimony and tin (REINDERS), A., ii, 731.
 of mixed crystals (ROOZEBOOM), A., ii, 132; (VAN EIJK), A., ii, 133; (HIJSINK), A., ii, 339; (ADRIANI), A., ii, 463.
 of isomorphous mixtures (BRUNI and GORTI), A., ii, 197.
 for water containing hydrogen chloride and phenol (EMERY and CAMERON), A., ii, 335.
- Freezing point determinations** of the electrolytic dissociation of potassium and sodium sulphates (ARCHIBALD), A., ii, 65.
- Freezing point.** See also Cryoscopy.
- Friction, internal.** See Viscosity.
- Friedel-Crafts' reaction** (PERRIER), A., i, 331; (BOESKKE), A., i, 349; (KRONBERG), A., i, 502.

 nitrogenous metabolism in the (v. MORACZEWSKI), A., ii, 31.
- d-Fructose.** See Levulose.
- Fruit products, detection of coal-tar colouring matters in** (WINTON), A., ii, 776.
- Fruit trees.** See Agricultural Chemistry.
- Fucose** from tragacanth (WIDTSOE and TOLLENS), A., i, 207.
- Fulminic acid**, relation of, to isocyanic acid (SCHOLL and KACER), A., i, 218.
 mercury salt, constitution and syn-
 thetical application of (SCHOLL), A., i, 144.
- Fulvene** (THIELE), A., i, 299.
- Fumaric acid** (*ethylendicarboxylic acid*), ethyl ester, condensation of, with benzyl cyanide (HENZE), A., i, 347.
- Fumaric acid**, chloro-, ethyl ester, condensation of, with benzamidine and guanidine (RUHEMANN and STAPLETON), T., 808; P., 1900, 122.
- Fumaric acid**, chloro-, ethyl ester, action of sodium phenoxide on (RUHEMANN and BEDDOW), T., 1123; P., 1900, 165.
- Fungi**, action of solutions of salts of fatty acids on (LÖVINSON), A., ii, 745.
- Furfuraldehyde** from beetroot and molasses (ANDRIJK), A., i, 110.
 action of Caro's reagent on (CROSS, BEVAN, and BRIGGS), A., i, 682.
 condensation of, with isobutaldehyde (LINDAUER), A., i, 305.
 detection of, in beer (HEIM), A., ii, 327.
 estimation of (CORMACK), T., 990; P., 1900, 156.
- Furfuraldehyde-p-nitrophenylhydrazones** (FEIST), A., i, 569.
- Furfuriminomethyl ether**, rearrangement of (WHEELER and ATWATER), A., i, 294.
- Furfurine**, an isomeride of (MILLINGTON and HIBBERT), P., 1900, 161.
- Furfuroids** of plant tissues (CROSS, BEVAN, and REMINGTON), A., ii, 611.
 physiological importance of, in sugar-beets (STOKLASA), A., ii, 100.
 distribution and importance of, in soils (STOKLASA), A., ii, 40.
- Furfurylacetic acid** (SANDELIN), A., i, 305.
- Furfurylacrylic acid** and the *allo*-acid, sublimation point of (LIEBERMANN and RIIBER), A., i, 648.
- Furfurylcarbinylsuccinic acid** (SANDELIN), A., i, 306.
- β -Furfuryl- α -p-chlorophenylacrylonitrile** (v. WALTHER and WETZLICH), A., i, 438.
- Furfuryl- α -cyanoacrylic acid**, ethyl ester (GUARESCHI), A., i, 53.
- 4-Furfuryldihydrodithiazine**, 2:6-dicyano- (HELLSING), A., i, 518.
- γ -Furfuryl- $\beta\beta$ -dimethylpropylene glycol** and its diacetate (LINDAUER), A., i, 305.
- Furfurylidene-bis-1-phenyl-3-methyl-5-pyrazolone** (TAMBOUR and LICINSKI), A., i, 365.
- γ -Furfurylpropane- $\alpha\beta\beta$ -tricarboxylic acid**, and its ethyl ester (SANDELIN), A., i, 306.
- β -Furfurylpropionic acid**, β -cyano-, and its ethyl ester (SANDELIN), A., i, 306.
- Furfurylsuccinamic acid** and its dibenzylidene derivative (SANDELIN), A., i, 306.
- Furfurylsuccinic acid** (SANDELIN), A., i, 306.
- Furnace**, tubular, giving fixed temperatures (GAUTIER), A., ii, 258.

Fusel oil, estimation of, in alcoholic liquids (ADAM), A., ii, 53; (BECKMANN and BRÜGGEMANN), A., ii, 175.

G.

Gadolinite from Batum (TSCHERNIK), A., ii, 551.

Gadolinium (DEMARÇAY), A., ii, 597.
and its compounds and salts (BENEDICKS), A., ii, 209.

Galactan, $C_6H_{10}O_5$ (EMMEBLING), A., ii, 743.

Galactase, the proteolytic ferment of milk, its properties, and action on the proteids of milk (BABCOCK and RUSSELL; v. FREUDENREICH), A., i, 712.

Galactosarabinose and its osazone and phenylbenzylhydrazone (RUFF and OLLENDORFF), A., i, 476.

Galactosamine, a new amino-sugar (SCHULZ and DITTHORN), A., i, 478.

Galactose from the albumen of the St. Ignatius bean and nux vomica (BOURQUELOT and LAURENT), A., ii, 498, 611.

from gulonic acid (FISCHER and RUFF), A., i, 539.

production of, by an enzyme (BOURQUELOT and HÉRISSEY), A., ii, 35, 233; (HÉRISSEY), A., ii, 561.

oxidation of, by hydrogen peroxide (MORRELL and CROFTS), T., 1219.

d-Galactose, degradation of (RUFF and OLLENDORFF), A., i, 476.

Galbanum, examination of (DIETERICH), A., ii, 118.

Galena, analysis of (MENNICKE), A., ii, 761.

Gallein and its esters, ethers, and acyl derivatives (ORNDORFF and BREWER), A., i, 447.

Gallic acid, thermochemistry of (MASOL), A., i, 499.

and tannic acid, estimation of (JEAN), A., ii, 632.

Gallin and its acetate and ether (ORNDORFF and BREWER), A., i, 448.

Galvanic elements. See Cells under Electrochemistry.

Ganglia, sympathetic, physiological action of extracts of (CLEGHORN), A., ii, 557.

Garnet, new variety of (MACLEOD and WHITE), A., ii, 663.

Gas, liquefaction of a, by "self-cooling" (NEWTH), P., 1900, 87.

fuel and illuminating, apparatus for the analysis of (THOMAS), A., ii, 169.

Gas, illuminating, estimation of benzene vapour in (PFEIFFER), A., ii, 173.

water, purification of, from iron carbonyl (VAN BRUKELEVEEN and TER HORST), A., ii, 348.

Gas analysis, technical (SCHMIDT), A., ii, 508.

burette for (WHITE), A., ii, 571.

Gas absorption apparatus (GAUTIER), A., ii, 366.

Gas washing apparatus (SCHALLER), A., ii, 48.

Gases, combustible, of atmospheric air (GAUTIER), A., ii, 537, 538, 720.

from the springs of Mont-Dore (PARMENTIER and HURION), A., ii, 415.

from the springs of Salsomaggiore (NASINI and SALVADORI), A., ii, 415.

influence of slight impurities on the spectra of (LEWIS), A., ii, 1, 701.

electrical conductivity in, traversed by cathode rays (MCLENNAN), A., ii, 587.

velocity of ions produced in, by Röntgen rays (ZELENY), A., ii, 587.

electrolytic, electrification of (KÖSTERS), A., ii, 4.

thermal conductivity of (SMOLUCHOWSKI and v. SMOLAN), A., ii, 68.

propagation of condensation waves in heated (LE CHATELIER), A., ii, 645.

determination of the molecular weight of, from their density (VAN DER WAALS), A., ii, 134.

relative rates of effusion of (DONNAN), A., ii, 390.

permanent, phenomena of effusion of (EMDEN), A., ii, 10.

apparatus for measuring volume of evolved (BENOIT), A., ii, 435.

apparatus for measuring evolved, at constant volume (JOB), A., ii, 434.

Gas generator, constant economical (KOENIG), A., ii, 718.

Gas-liquor, ammoniacal, estimation of carbon dioxide in (CHEVALET), A., ii, 170.

Gaseous mixtures, liquefaction of (CAUBET), A., ii, 191, 390, 646.

reactions in chemical kinetics (BODENSTEIN), A., ii, 12.

Gasometer, new (RIBAN), A., ii, 340.

Gastric juices, estimation of chlorine in (MEILLEKE), A., ii, 509.

estimation of combined hydrochloric acid in (COHNHEIM and KRIEGER), A., ii, 508, 778.

See also Stomach.

Gattermann's and Sandmeyer's reactions, electrolytic modification of (VOTOČEK and ZENÍŠEK), A., i, 19.

- Gaultherin** and **Gaultherase** from **Spiræas** (BEYERINCK), A., i, 108.
- Gelatin**, properties of (MÖRNER), A., i, 128.
- equilibrium between water, alcohol and (HARDY), A., ii, 896.
- condition of substances formed in, insoluble in water (DE BRUYN), A., ii, 136, 717.
- as a proteid-sparing food (KIRCHMANN), A., ii, 669.
- Genistein** and its methyl and ethyl ethers and their acetyl derivatives and decomposition products (PERKIN and HORSFALL), T., 1310; P., 1900, 182.
- Gentiopierin**, preparation of (BOURQUELOT and HÉRISSEY), A., i, 511.
- isoGeranic acid**, synthesis of (TIEMANN), A., i, 275.
- Geraniol**, estimation of, in oil of citronella (SCHIMMEL and Co.), A., ii, 175.
- isoGeraniolene** (TIEMANN), A., i, 275.
- Geranium oil**, constituents of (JEAN-CARD and SATIE), A., i, 242.
- Germination**. See **Agricultural Chemistry**.
- Gila monster**, physiological action of the poison of the (VAN DEUBURG and WIGHT), A., ii, 677.
- Ginger**, analysis of (CLAYTON), A., ii, 60.
- oil of, constituents of (v. SODEN and ROJAHN), A., i, 605.
- Glacial deposits** from Norway (HOLLAND and DICKSON), A., ii, 151.
- Glands**, fat in (NIKOLAIDES), A., ii, 153.
- lymphatic, chemistry of the (MENDEL and NAKASEKO), A., ii, 556.
- submaxillary, gaseous metabolism of the (BARCROFT), A., ii, 417.
- thymus, histon-like substances from (FLEROFF), A., i, 71.
- thymus and thyroid, iodine in the (MENDEL), A., ii, 152.
- thyroid, chemistry and physiology of the (OSWALD), A., ii, 358.
- effect of feeding with, on monkeys (EDMONDS), A., ii, 224.
- as a poison-removing organ (BLUM), A., ii, 224.
- of dogs, iodine in the (GLEY and BOURCET), A., ii, 555.
- of infants, variations of the iodine of the (CHARRIN and BOURCET), A., ii, 419.
- of sheep (SUIFFET), A., ii, 671.
- Glandular secretions**, defence of the organism against the toxic properties of (CHARRIN and LEVADITI), A., ii, 224.
- Glass**, composition of (ZULKOWSKI), A., ii, 595.
- bottle, composition of (DRALLE), A., ii, 482; (ZULKOWSKI), A., ii, 654.
- action of fluorine and hydrogen fluoride on (MOISSAN), A., ii, 140.
- Glass tubes**, calibration of (HULETT), A., ii, 397.
- Glauberite**, formation of, at 25° (VAN'T HOFF and CHIARAVIGLIO), A., ii, 284.
- Glaucocroite** from New Jersey (PENFIELD and WARREN), A., ii, 88.
- Glauconic acids** (DOEBNER), A., i, 313.
- Gluconasturtiin** (GADAMER), A., i, 49.
- Gluconic acid**, formation of (NIEBEL), A., i, 540.
- Glucoproteids** of white fibrous tissue (GIES and CUTTER), A., ii, 293.
- Glucosamine** (*chitosamine*) hydrochloride, behaviour of, in the organism (OFFER and FRÄNKEL), A., ii, 294.
- d-Glucose**. See **Dextrose**.
- l-Glucocephenylobenzylhydrasone** (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.
- Glucosides** containing thiocarbimides (TER MEULEN), A., i, 511.
- from parsley (PERKIN), T., 416; P., 1900, 44; (VONGERICHTEN), A., i, 681.
- from senna (TSCHIRCH and HIEPE), A., i, 681.
- in tobacco leaves (BEHRENS), A., ii, 239.
- from xanthorhamnin (C. and G. TANRET), A., i, 185.
- sugars of some (VOTOČEK), A., i, 355.
- $C_{20}H_{40}O_{15}$ (Wakamba arrow poison), (BRIGER), A., i, 243.
- Glucosides**. See also :—

- Glue**, distinction between, and dextrin or gum arabic (BORNTRÄGER), A., ii, 631.
analysis of (FAHRION), A., ii, 59.
- Glutamic acid**, detection of, in animal proteids by sulphuric acid (KUTSCHER), A., i, 67.
- Glutaric acid**, (*n-pyrotartaric acid*; *propanedicarboxylic acid*), formation of (BOTTOMLEY and PERKIN), T., 300; P., 1900, 16.
methylenes, and methyl ester of (MEERBURG), A., i, 144.
 β -bromo- (β -SEMENOFF), A., i, 10.
bromo-, ethyl ester, action of alcoholic potash on (BOWTELL and PERKIN), P., 1899, 241.
- Glutaric derivatives**, synthesis of (GUARISCHI and GRANDE), A., i, 111; (MINOZZI), A., i, 406.
- Gluten meal**. See Agricultural Chemistry.
- Glutins**, hydrobromide and hydroiodide (PAAL), A., i, 467.
- Glyceric acid**, oxidation of, in presence of ferrous salts (FENTON and JONES), T., 72; P., 1899, 224.
- Glycerol** (*glycerin*), preparation of acrylic acid from (WÖHLK), A., i, 425.
some properties of (STRUVE), A., ii, 446.
estimation of, in fats and soaps (JEAN), A., ii, 694.
- Glycerophosphoric acid**, salts of (GUÉDRAS), A., i, 75.
- Glycerophosphoric acids**, velocity and limits of the formation of (IMBERT and BELUGOU), A., i, 130.
- Glyceryl acetodiformate** (BÉHAL), A., i, 581.
diiodohydrin, decomposition of (CHABON and SEAILLES), A., i, 472.
diisopropyl, *di-tert-butyl*, *dicapryl*, *dioctyl*, and *dibenzyl* ethers (ZU-NINO), A., i, 535.
nitrate, decomposition of, by alkalis (BERTHELOT), A., i, 620.
- Glycine** (*glycine*; *aminoacetic acid*), new derivative of (BALBIANO and TRACIATTI), A., i, 632.
- Glycocholic acid**, Hüfner's method of preparing pure (OSBORNE), A., ii, 419.
- Glycogen**, origin of, from proteid (SCHÖNDORFF), A., ii, 740.
preparation of (GAUTIER), A., i, 81; (BENDIX and WOHLGEMUTH), A., ii, 491.
amount of, in an organ, not extractable by water (NERKING), A., ii, 740.
- Glycogen**, formation of, after iulin feeding (NAKASEKO), A., ii, 670.
transformation of fat into (BOUCHARD and DESGREZ), A., ii, 418.
- Oxidation product of**, with bromine (NIEBEL), A., i, 540.
hepatic, increase of, during pregnancy (CHARRIN and GUILLEMONAT), A., ii, 292.
estimation of (GAUTIER), A., i, 81; (PFLÜGER), A., ii, 581.
estimation of, in horseflesh and preserved meats (BREUSTEDT; HAYWOOD), A., ii, 321.
- Glycol**. See Ethylene glycol.
- Glycollic acid** and its calcium salt (BÜTTINGER), A., i, 582.
oxidation of, in presence of ferrous salts (FENTON and JONES), T., 70; P., 1899, 224.
phenyl ester, reactions of (MOREL), A., i, 158.
- Glycollic aldehyde**, formation of α - and β -acrose from (JACKSON), T., 129; P., 1899, 238.
degradation of (FENTON), T., 1294; P., 1900, 148.
- Glycollic aldoxime** (FENTON), T., 1296; P., 1900, 148.
- Glycolloglycollic acid** (BÜTTINGER), A., i, 582; (WOLFF and LÜTTINGHAUS), A., i, 583.
- Glycollonitrile**, acetyl derivative, preparation of, and action of ammoniacal silver oxide on (FENTON), T., 1297; P., 1900, 148.
- Glycuronic acid** in normal urine (MAYER), A., ii, 155; (MAYER and NEUBERG), A., ii, 421.
phenylhydrazine derivatives of, and its detection (MAYER), A., i, 204.
- Glycyrrhiza glabra*, oil of (HAENSEL), A., i, 107.
- Glycyrrhizin**, estimation of, in liquorice extract (HAFNER), A., ii, 828, 775.
- Glyoxal**, condensation of, with *isobutaldehyde* (v. HOENBOSTEL and SIEBNER), A., i, 206.
- Glyoxaline-red**, formation of (RUHEMANN and STAPLETON), T., 809; P., 1900, 122.
- Glyoxime N-ethers**, aromatic (BAMBERGER), A., i, 341; (BAMBERGER and TSCHIRNER), A., i, 342.
- Glyoxylic acid** and its salts (BÜTTINGER), A., i, 582.
preparation of (DOEBNER), A., i, 473.
- Gold**, crystallisation of (DITTE), A., ii, 549.
- Gold alloys** with aluminium (HEYCOCK and NEVILLE), A., ii, 549.

- Gold alloys** with platinum, analysis of (PÄRWOZNIK), A., ii, 111.
- Gold compounds** with mercury, isomorphous (BEHRENS), A., ii, 213.
- Gold carbide** (MATHEWS and WATTERS), A., i, 323.
- chloride, hydrolysis of (KOHLEAUSCH), A., ii, 408.
- aurichlorides, abnormal, of organic bases (FENNER and TAFEL), A., i, 111.
- Gold, detection and estimation of:—**
- Gold,** detection of minute quantities of, in ores (DÖRING), A., ii, 371, 445.
- estimation of, iodometrically (GOOCH and MORLEY), A., ii, 110.
- estimation of small quantities of platinum in (RÖSSLER), A., ii, 733.
- Gonococcus** and its toxin (DE CHRISTMAS), A., ii, 742.
- Graftonite** from New Hampshire (PENFIELD), A., ii, 216.
- Grain.** See Agricultural Chemistry.
- Gramineæ.** See Agricultural Chemistry.
- Granatan-nucleus,** optical properties of the (PICCININI), A., i, 249.
- Granulite** from Cape Marsa (DUPARC and PEARCE), A., ii, 219.
- Grape Sugar.** See Dextrose.
- Grapes,** estimation of malic acid in (ORDONNEAU), A., ii, 250.
- Graphite** as a compressed powder, electrical conductivity of (STREINTZ), A., ii, 641.
- specific heat of, at low temperatures (BEHN), A., ii, 259.
- estimation of, by loss (AUCHY), A., ii, 313.
- Graphite mineral** from Moravia (KOVÁŘ), A., ii, 147.
- Graphitic acid** and ψ -Graphitic acid (STAUDENMAIER), A., ii, 15.
- Guaiaacol,** condensation of, with ethyl phenylpropionate (RUHEMANN and STAPLETON), T., 1180; P., 1900, 168.
- sodium, compounds of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 396.
- estimation of, in wood-tar creosote (KEBLER), A., ii, 176.
- Guaiaacol, tri- and tetra-chloro-, and tetrabromo-,** action of nitric acid on (COUSIN), A., i, 179, 487.
- isomitroso-, ethers, and benzoyl and bromo-derivatives of (BRIDGE and MORGAN), A., i, 158.
- Guaiaacolecarboxylic acid,** methyl ester, nitro- and amino- (EINHORN), A., i, 440.
- Guaiaacoxyl-acetyl-, -malonyl-, and -propionyl-phenetidine** (BISCHOFF), A., i, 396.
- α -Guaiaacoxyl-propionic, -n- and -isobutyric, -malonic, and -isovaleric acids** and their ethyl esters (BISCHOFF), A., i, 396.
- Guanidine,** condensation of, with the ethyl esters of acetylenedicarboxylic and chlorofumaric acids (RUHEMANN and STAPLETON), T., 805; P., 1900, 122.
- action of, on ethyl phenylpropionate (RUHEMANN and STAPLETON), T., 242; P., 1900, 12.
- preparation of carbamide from (FLEMING), A., i, 280.
- derivatives of diacetoneamine (TRAUBE and SCHALL), A., i, 118.
- Guanine,** new synthesis of (TRAUBE), A., i, 416.
- Guano.** See Agricultural Chemistry.
- Gulonic acid,** conversion of, into xylose and galactose (FISCHER and RUFF), A., i, 539.
- L-Gulonic acid,** compounds of, with benzaldehyde and formaldehyde (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.
- Gum** in elm galls (PASSERINI), A., ii, 427.
- of *Grevillea robusta* (RÖSEK and PUAUX), A., i, 82.
- Gum tragacanth** (HILGER and DREYFUS), A., i, 379.
- arabinose, fucose and xylose from (WIDTSON and TOLLENS), A., i, 207.
- Gun-cotton,** tests for stability of (HOITSEMA), A., ii, 55.
- Guttapereha,** analysis of (BORNTÄGER), A., ii, 775.
- Gymnite** from Moravia (KOVÁŘ), A., ii, 148.
- Gypsum,** setting of (ZULKOWSKI), A., ii, 76.
- and anhydrite deposits at Oulx, Piedmont, minerals in the (COLOMBA), A., ii, 216.
- See also Calcium sulphate.

H.

- Hæmatic acid** (KÜSTER), A., i, 68, 319; (KÜSTER and KÖLLE), A., i, 69.
- Hæmatin,** neutral (ARNOLD), A., i, 318.
- preparation and oxidation of (KÜSTER), A., i, 68.
- obtained by the use of pepsin-hydrochloric acid (V. ZEYNEK), A., i, 711.
- decomposition products of (KÜSTER), A., i, 68, 319.
- Hæmatoporphyrin** and its salts and ethers (NENCKI and ZALESKI), A., i, 710.

Hematoporphyrin, preparation and oxidation of (KÜSTER and KÖLLE), A., i, 69.

spectrum of (ARNOLD), A., i, 127.

action of bromine on (MARCHLEWSKI and SCHUNCK), T., 1091; P., 1900, 149.

Hematoxin, action of, on man (METCHNIKOFF and BESREDKA), A., ii, 741.

Hematoxylin (GILBODY and PERKIN), P., 1899, 241.

constitution of (PERKIN and YATES), P., 1900, 108; (v. KOSTANECKI and FEUERSTEIN), A., i, 856.

as a photographic developer (LEPETIT), A., ii, 519.

Hematoxylon campechianum, constituents of (PERKIN), T., 426; P., 1900, 45.

Hæmin and its acetyl derivative and their ethers (NENCKI and ZALESKI), A., i, 709.

Hæmin crystals, preparation of (v. ZEYNEK), A., i, 711.

Hæmochromogen obtained by the use of pepsin-hydrochloric acid (v. ZEYNEK), A., i, 711.

Hæmoglobin, formation of, functions of the nucleus in relation to the (STASSANO), A., ii, 666.

absorption of oxygen and carbon monoxide by (DE SAINT-MARTIN), A., ii, 665.

action of chloroform and chloral hydrate on (FORMÁNEK), A., i, 532.

of the horse, amount of iron in the (LAPICQUE and GILARDONI), A., i, 467.

assimilation of iron by, and estimation of (ABDERHALDEN), A., ii, 223, 289, 416.

Methæmoglobin, formation of (v. ZEYNEK), A., i, 196; (HÜFNER), A., i, 267.

cysano- and photo- (HALDANE), A., i, 318.

Oxyhæmoglobin crystals from pigeons' blood (SCHWANTKE), A., i, 711.

Hæmorrhage, severe, infusion after (DAWSON), A., ii, 291.

and transfusion in dogs (DAWSON), A., ii, 291, 417.

Halogen compounds, organic, decomposition of, by sodium (LÖWENHERZ), A., ii, 338.

Halogens, specific gravity of the, at their boiling points (DRUGMAN and RAMSAY), T., 1228; P., 1900, 172.

law governing the elimination of, from the benzene ring (KLAGES and LIECKE), A., i, 387.

displacement of, from halogenated fatty acids (DE BARRÉ), A., i, 76.

VOL. LXXVIII. ii.

Halogens and hydroxyl, isomorphous replacement of (FELS), A., i, 338.

estimation of, in organic compounds (BERTHELOT; VALEUR), A., ii, 172.

Hamlinite (HUSSAK and PRIOR), A., ii, 601; (PRIOR), A., ii, 602.

Hancockite from New Jersey (PENFIELD and WARREN), A., ii, 88.

Hardystonite from Franklin furnace, New Jersey (WOLFF), A., ii, 735.

Hay. See Agricultural Chemistry.

Hazelnut oil (HANUS), A., ii, 101.

Heart, action of caffeine and theobromine on the (BOCK), A., ii, 424.

action of nicotine on the (WINTERBERG), A., ii, 424.

action of the toxic products of the typhoid bacillus on the (KEMP and DEWEY), A., ii, 559.

value of calcium and potassium ions on the (LOEB), A., ii, 491.

mammalian, excised, action of oxygen on a (STRECKER), A., ii, 491.

Heat. See Thermochemistry.

Hedenbergite from Dartmoor (BUSZ), A., ii, 217.

from Japan (JIMBÔ), A., ii, 87.

Helipora cœrulea. See Coral.

Helium, relative rates of effusion of, and of other gases (DONNAN), A., ii, 390.

solubility of, in water (ESTREICHER), A., ii, 205.

Hemicelluloses, estimation of, in plants (KLEIBER), A., ii, 630.

Hemimorphite from New Jersey (CLARKE and STEIGER), A., ii, 24.

Hemipinic acid, thermochemistry of (LEROY), A., ii, 261.

Metahemipinic acid (GILBODY and PERKIN), P., 1899, 241; (GILBODY, PERKIN, and YATES; PERKIN and YATES), P., 1900, 107.

Hemp. See Agricultural Chemistry.

Heptanaphthene. See Methylcyclohexane.

Heptane ($\beta\beta$ -dimethylpentane; trimethylpropylmethane) (MARKOWNIKOFF), A., i, 469.

Heptane (triethylmethane) nitration of (KONOWALOFF and KOTSINA), A., i, 324.

Heptanes in Grosny naphtha (CHARITSCHKOFF), A., i, 74.

cycloHeptanecarboxylic acid, tribromo- (BEAREN and BUCHNER), A., i, 292.

Heptanedicarboxylic acids. See:—Azelaic acid.

Methylisopropylglutaric acids.

Tetramethylglutaric acids.

Heptanetricarboxylic acid. See $\alpha\beta\beta$ -Trimethylbutane- $\alpha\alpha\beta$ -tricarboxylic acid.

- cyclo*Heptanone (*suberone*) peroxide (v. BAEYER and VILLIGER), A., i, 329.
- cyclo*Heptanoneisoxime (*suberonisoxime*) and its salts (WALLACH), A., i, 45.
- and its hydrolysis (WALLACH), A., i, 590.
- cyclo*Heptatrienecarboxylic acids, α - and β - (α - and β -isophenylacetic acids), affinity constants of (ROTH), A., ii, 590.
- cyclo*Heptenecarboxylic acids, Δ^1 - and Δ^2 - (BRAKEN and BUCHNER), A., i, 292.
- affinity constants of (ROTH), A., ii, 590.
- Heptenoic acids (WALLACH), A., i, 45, 590.
- Heptinene ($\beta\beta$ -dimethyl- $\beta\beta$ -pentadiene) (GRIGNARD), A., i, 382.
- Heptoleic acid (α -isopropylbutyric acid, ethylisopropylacetic acid) and its derivatives, preparation of (CROSSLEY and LE SUEUR), T., 89; P., 1899, 225.
- its ethyl ester, amide, anilide, and toluidide (CROSSLEY and LE SUEUR), T., 93; P., 1899, 225.
- α -bromo-, ethyl ester, action of diethylaniline on (CROSSLEY and LE SUEUR), T., 95; P., 1899, 225.
- Heptoleic acid ($\alpha\beta$ -trimethylbutyric acid) γ -cyano-, ethyl ester (THORPE and YOUNG), T., 939; P., 1900, 115.
- Heptoleic acid, ζ -bromo-, and ζ -iodo- (v. BAEYER and VILLIGER), A., i, 329.

- cyclo*Hexanoneisoxime and its hydrolysis (WALLACH), A., i, 590.
- cyclo*Hexane (*tetrahydrobenzene*) (LUNGE and AKUNOFF), A., i, 543.
- spectrum of (HARTLEY and DOBBIE), T., 846; P., 1900, 129.

- 8-*Hexenic acid*** and its salts (WALLACH), A., i, 590.
- Hexenoic acid** (*β-isopropylacrylic acid*), ethyl ester, condensation of, with ethyl sodiocyanoacetate (HOWLES, THORPE, and UDALL), T., 943; P., 1900, 116.
- Hexenoic acid** (*β-methylethylacrylic acid*) and its salts (POKROVSKY), A., i, 328.
- Hexethylidenetetramine** and its salts (KUDERNATSOH), A., i, 337.
- Hexinene** (*trimethylallylene*), action of hypochlorous and hypobromous acids on (WITTORF), A., i, 421.
- Hexoic acid** (*caproic acid*) amino- and ϵ -amino- (WALLACH), A., i, 589.
- as-diamino-*. See Lysine.
- isoHexoic acid** (*γ-methylvaleric acid*), barium and calcium salts, water of crystallisation of (ORNSTEIN), A., i, 7.
- Hexon bases**, isolation of, by benzoic chloride (LAWROFF), A., i, 110.
- Hexylamine** (*γ-amino-ββ-dimethylbutane*) and the action of benzenesulphonic acid on (SOLONINA), A., i, 82.
- β-Hexylamine** (v. BRAUN and STECHELE), A., i, 429.
- β-Hexylene**, nitrosate of (IPATIEFF), A., i, 3.
- Hexylenes** (*γ-methyl-β-amylene* and *δ-methyl-γ-amylene*), nitrosates and nitroanilides of (IPATIEFF), A., i, 3.
- Hippuric acid**, maximum production of, in rabbits (PARKER and LUSK), A., ii, 419.
- estimation of (BLUMENTHAL), A., ii, 770.
- Hippuroflavin**, constitution of (RÜGHEIMER), A., i, 609.
- homologues of (RÜGHEIMER and FEHLHAER), A., i, 609.
- Histidine** from the proteid of couifer seeds (SCHULZE and WINTERSTEIN), A., ii, 101.
- from the proteid of *Lupinus luteus* seedlings (SCHULZE), A., ii, 101.
- and its salts, rotatory power of (KOSSEL and KUTSCHER), A., i, 71.
- dichloride, crystalline form of (SCHWANTKE), A., i, 608.
- Histon** from leucocytes, decomposition products of (LAWROFF), A., i, 71.
- Hitchcockite** (HARTLEY), A., ii, 600; (PRIOR), A., ii, 602.
- Hollyhock flowers**, composition of (ZAY), A., ii, 563.
- Homocamphanic acid**, formation of (LAPWORTH), T., 1066; P., 1900, 128.
- α-Homocamphoramic acid**, formation of (LAPWORTH), T., 1061; P., 1900, 128.
- Homocamphoric acid** and its bromination (LAPWORTH), T., 1053; P., 1900, 128.
- α -bromo-, and its diethyl ester, action of bases on (LAPWORTH), T., 1066; P., 1900, 129.
- Homocamphoric dianilide** (LAPWORTH), T., 1063.
- Homocamphoronic acid** (LAPWORTH and CHAPMAN), T., 309; P., 1900, 4.
- bromination of (LAPWORTH and CHAPMAN), T., 452; P., 1900, 56.
- β-Homocyclidone** (MURRILL and SCHLOTTERBECK), A., i, 686.
- Homocyclo-cinchenine** and *cinchenic acid*, and their ethyl ethers (KOENIGS), A., i, 247.
- Homodihydroisolaurenamine** and its salts (BLANC), A., i, 240.

- 6-Hydroxy-4-furfuryl- $\Delta^{3,4}$ -dihydropyridone**, 3:5-dicyano- (GUARESCHI), A., i, 53.
- β -Hydroxyglutaric acid**, distillation of (FICHTER and KRAFFT), A., i, 8.
- ζ -Hydroxyheptioic acid**, its ethyl esters and salts (v. BAER and VILLIGER), A., i, 329.
- α -Hydroxyhomocamphoric acid**, lactone of. See Homocamphanic acid.
- p*-Hydroxyhydratropic acid** (BOUGAULT), A., i, 549.
- 5-Hydroxyhydrindene** (MOSCHNER), A., i, 344.
- Hydroxyl** and halogens, isomorphous replacement of (FELS), A., i, 338.
alcoholic, phenylthiocarbimide as a reagent for the detection of (ORNDORFF and RICHMOND), A., i, 156.
phenolic, influence of (MASSOL), A., i, 600.
- Hydroxyl-function**, thermal value of (DE FORCRAND), A., ii, 526.
- Hydroxylamine**, preparation of free (UHLENHUTH), A., ii, 475.
spectrum of (HARTLEY and DOBBIE), T., 321; P., 1900, 14.
electrolysis of (SZARVASY), T., 608 : P., 1900, 3.
oxidation of (v. KNORRE and ARNDT), A., ii, 204.
action of, on bromoamines (KIJNER), A., i, 277, 333.

- Hydroxylamine**, action of, on ethyl β -cyanophenylpyruvate (ERLENMEYER), A., i, 649.
 action of, on ethyl phenylpropiolate (RUHEMANN and STAPLETON), T., 240; P., 1900, 11.
 reactions of, with hydroxy- and unsaturated compounds (TINGLE), A., i, 544.
 salts, isomerism of, with salts of ammonium and of hydrazine (SABANIEFF), A., ii, 18.
 hydrochloride, gradual decomposition of, when impure (DIVERS and HAGA), T., 978; P., 1900, 147.
 action of, on ketones of the type $\text{CO}(\text{CH}:\text{CHR})_2$, in presence of sodium acetate (MINUNNI and CARTA-SAITTA), A., i, 237.
 formic acid derivatives of (SCHROETER and PESCHKES), A., i, 485.
 nickel sulphate compound of (UHLENHUTH), A., ii, 482.
 platinum compounds of (UHLENHUTH), A., ii, 485, 659.
- Hydroxylamines**, aromatic, nature and position of substituents in, in their reaction with nitrocompounds (ANGELI and ANGELICO), A., i, 221.
 action of alkalis on (BAMBERGER and BRADY), A., i, 221.
 oxidation of aqueous solutions of, by atmospheric oxygen (BAMBERGER), A., i, 220.
 β -aromatic, action of diazomethane on (BAMBERGER and TSCHIRNER), A., i, 342.
 action of formaldehyde on (BAMBERGER), A., i, 341.
- 1-Hydroxylaminocamphane** (β -bornylhydroxylamine) (FORSTER), T., 255; P., 1900, 14.
- 7(t)-Hydroxylepidone** and its acyl derivatives (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- α -Hydroxymandelic aldehyde** and its osazone and semicarbazone (STORMER), A., i, 656.
- Hydroxymercuribenzoic acid**, and anhydride, and its salts (PESCI), A., i, 546.
- 4-Hydroxymethyl alcohol**, and methyl ether, 2,6-dibromo-, and their acetyl derivatives (AUWERS, TRAUN, and WELDE), A., i, 166, 169.
 alcohol, 2,6-dibromo- (AUWERS and TRAUN), A., i, 167.
- p -Hydroxymesitylaniline**, dibromo-, phenylurethanes of, and acetyl derivative (AUWERS, TRAUN, and WELDE), A., i, 166.
- p -Hydroxymesitylene-aldehyde**, -imine-ether, and -nitrile (THIELE and EICHWEDE), A., i, 501.
- Hydroxymethanesulphonic acid**, energy of (COJAZZI), A., i, 327.
- 4- p -Hydroxy- m -methoxybenzylidenebis-1-phenyl-3-methyl-5-pyrazolone** (TAMBOR and LICIŃSKI), A., i, 364.
- 3-Hydroxy-5-methoxy-2-methylphenol** and its hydrochloride and tetracetyl derivative (KONYA), A., i, 545.
- 3-Hydroxy-5-methoxy-2-methyl- p -quinone** and its 4-oxime, and p -quinol and its triacetyl derivative (KONYA), A., i, 545.
- 1,4-Hydroxymethoxynaphthalene** (RUSIG), A., i, 602.
- Hydroxymethoxynaphthalene-2-carboxylic acid**, and its esters (RUSSIG), A., i, 601.
- 3-Hydroxy-4-methoxyphenanthrene** (isomethylmorphol), synthesis of, and its acetyl derivative and 9-carboxylic acid (PSCHORR and SUMULEANU), A., i, 487.
- 7-Hydroxy-8-methoxy-3-phenyl-2-carboxtyril** (PSCHORR and SUMULEANU), A., i, 488.
- 6-Hydroxy-4- p -methoxyphenyl- $\Delta^{3,6}$ -dihydropyridone**, 8:5-dicyano- (GUARIESCHI), A., i, 52.
- Hydroxymethyl- α -benzoiesulphinide**, synthesis of (MASELLI), A., i, 596.
- 1-Hydroxy-6-methyl-1:2:3-benzotriazole** (toluencaziminol) (ZINCKE and SCHWARZ), A., i, 528.
- 4-Hydroxy-3-methylisocarbostyryl** (GABRIEL and COLMAN), A., i, 358.
- 6-Hydroxy-2-methylchromone**, and its acetyl derivative (CRIVELLI and v. KOSTANECKI), A., i, 668.
- 7-Hydroxy-2-methylchromone** (BLOCH and v. KOSTANECKI), A., i, 308.
- 2-Hydroxy-3-methyldiphenyl-5-nitroso-**, and its benzoyl derivative (BORSCHKE), A., i, 594.
- Hydroxymethylenetropinone** (WILLSTÄTTER and IGLAUER), A., i, 244.
- 2-Hydroxy-4-methyl-3-ethylquinoline** (CAMPS), A., i, 310.
- 8-Hydroxymethylfluorone** (WEIDEL and WENZEL), A., i, 308.
- β -Hydroxy- β -methyl- ϵ -heptenoic acid** and its ethyl ester (v. BRAUN and STECHELE), A., i, 429.
- Hydroxymethylhexoic acid** and its ethyl ester and silver salt (v. BAEYER and VILLIGER), A., i, 329.
- α -Hydroxy- α -methylisohexylacetic acid**. See α -Hydroxy- α -dimethylheptoic acid.

- 2-Hydroxymethyl-5-phenyl-3-triazol-one-1-propionic acid** (BAILEY and ACREE), A., i, 528.
- 4-Hydroxy-1-methylpyrazole** and its salts (WOLFF), A., i, 692.
- 6-Hydroxy-4-methylpyrimidine**, hydriodide of (GABRIEL and COLMAN), A., i, 55.
- Hydroxymethylquinolines**, 2:4- and 4:2-, synthesis of (CAMPS), A., i, 115.
- 4-Hydroxy-3-methylisoquinoline**, 1-chloro- (GABRIEL and COLMAN), A., i, 359.
- Hydroxymethylquinoxaline** (RUHEMANN and STAPLETON), T., 249; P., 1900, 12.
- 4-Hydroxy-2-methyltrimesic acid** and its esters (ERRERA), A., i, 33.
- 8-Hydroxynaphthalene-4:6-disulphonic acid**, 1-amino- (*aminonaphthol-K-acid*), use of, for the detection of nitrous acid in water (ERDMANN), A., ii, 243; (SPIEGEL), A., ii, 318; (MENNICKE), A., ii, 438, 621.
- Hydroxynaphthalic anhydride**, and derivatives (ANSELM and ZUCKMAYER), A., i, 175.
- Hydroxynaphthaloxime** and its diacetyl derivative (ANSELM and ZUCKMAYER), A., i, 176.
- Hydroxynaphthaquinone** and its acetyl derivative (THIELE and WINTER), A., i, 505.
- 2-Hydroxy- α -naphthaquinone-3-acetic acid** (LIEBERMANN), A., i, 311.
- 2-Hydroxy-1-naphthylacetic acid** and bromo-, and their lactones; and di-chloro- (STOERMER), A., i, 656.
- 2-Hydroxyisonicotinic acid**, 6-chloro-, and 6-amino- (SELL and DOOTSON), T., 236; P., 1900, 9.
- Hydroxydinitrobenzenesodiphenylaminesulphonic acid**, sodium salt (GNEHM and WERDENBERG), A., i, 94.
- Hydroxypentanesulphonic acid**, energy of (COJAZZI), A., i, 327.
- 3-Hydroxyphenanthrene** and its acetyl derivative (PSCHORR and SUMULEANU), A., i, 488.
- 4-Hydroxyphenanthrene**, synthesis of, and its methylether and acetyl derivative (PSCHORR and JAECKEL), A., i, 488.
- o*-Hydroxyphenoxyacetic acid**. See Catecholacetic acid.
- m*-Hydroxyphenoxyacetic acid** (*resorcinolacetic acid*), and its silver salt and anilide (CARTER and LAWRENCE), T., 1222; P., 1900, 152.
- p*-Hydroxyphenoxyacetic acid** (*quinolacetic acid*) and its aniline salt and anilide (CARTER and LAWRENCE), T., 1222; P., 1900, 152.
- o*-Hydroxyphenylacetic acid**, and its amide, chloride, and lactone; and 5-chloro- and its lactone (STOERMER), A., i, 656.
- 2-Hydroxyphenylacetic acid**, 5-nitro-, and its ethyl ester and lactone (HILL, SOCH, and OENSLAGER), A., i, 538.
- m*-Hydroxyphenylaminocrotonic acid**, ethyl ester (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- Hydroxyphenyleoumalin** (HESSE), A., i, 35.
- 4-*o*-Hydroxyphenyldihydrodithiazine**, 2:6-dicyano- (HELLSING), A., i, 518.
- 6-Hydroxy-4-phenyl- $\Delta^{3,6}$ -dihydropyridone**, 3:5-dicyano- (*dicyanophenylglutacetonimide*), and its salts (GUARENCHL), A., i, 52.
- o*-Hydroxyphenylmethylurethane** and its benzoyl derivative (RANSOM), A., i, 219.
- 4-Hydroxy-1-phenylpyrazole**, and its 3-carboxylic acid (WOLFF), A., i, 692.
- 2-Hydroxy-4-phenylquinoline** (CAMPS), A., i, 310.
- 5-Hydroxy-1-phenyltriazole** and its 3-benzyl, 3-methyl, and 3-ethyl derivatives (RUPE and LABHARDT), A., i, 258.
- 2-Hydroxy-1-phenyl-4:4:6-trimethyldihydropyrimidine** (TRAUBE and SCHALL), A., i, 118.
- o*-Hydroxyphenylurethane** from *o*-aminophenyl ethyl carbonate, and its benzoyl derivative (RANSOM), A., i, 218.
- p*-Hydroxyphthalaldehyde**, tribromo-, its isomeride, and acetyl derivatives (AUWERS and BURROWS), A., i, 99.
- p*-Hydroxyphthalanil**, dibromo-, preparation of (MEYER), A., i, 447.
- 5-Hydroxyisophthalic acid**, 2:4:6-triamino-, and its tetracetyl derivative (NIETZKI and PETRI), A., i, 486.
- 3-Hydroxypiperidone**, preparation of (EMMERLING), A., i, 16.
- Hydroxyvalic acid** (WESSELY), A., i, 428.
- 8-Hydroxypropaldehydediethylacetal** (WOHL and EMMERICH), A., i, 627.
- α -Hydroxypropionic acid**. See Lactic acid.
- α -Hydroxyisopropyl- γ -hexenoic acid** (RUPE), A., i, 372.
- Hydroxypropyldienoxanilide** (v. PECHMANN and ANSEL), A., i, 389.
- 4-Hydroxy-2-propylquinoline** (CAMPS), A., i, 310.
- 4-Hydroxypyrazole** and its 3-carboxylic acid (WOLFF), A., i, 691.
- 2-Hydroxypyridine**, 3:4:5:6-tetrachloro- (SELL and DOOTSON), T., 772.

6-Hydroxypyrimidine, 2:4-*di*- and 2:4:5-*tri*-amino- (TRAUBE), A., i, 416.

Hydroxypyrimidinecarboxylic acid, amino-, ethyl ester of (RUHEMANN and STAPLETON), T., 808; P., 1900, 122.

Hydroxypyruvic acid, constitution of (ABERSON), A., i, 200.

8-Hydroxyquinoline, fate of, in the organism (ROST), A., ii, 154.

Hydroxyquinolines, 2- and 4-, syntheses of (CAMPS), A., i, 115, 310.

4-Hydroxyisoquinoline, 1-chloro- (GABRIEL and COLMAN), A., i, 358.

8-Hydroxyquinolinecarboxylic acid, its esters, and nitro- and amino-derivatives (EINHORN), A., i, 441.

o-Hydroxyquinolineglycuronic acid (BRAHM), A., ii, 95.

o-Hydroxyquinolinesulphonic acid, physiological action of (BRAHM), A., ii, 95.

See also Quinosol.

Hydroxystearic acid and its acetyl derivative (KASANSKY), A., i, 426.

Hydroxystyrogallol (2:3:6-*tri*hydroxy-*anthracoumarin*), preparation and triacetyl derivative of (SLAMA), A., i, 177.

Hydroxysulphonaphthalic anhydride (ANSELM and ZUCKMAYER), A., i, 175.

Hydroxyterephthalic acid, esterification of (WEGSCHEIDER and BITTNER), A., i, 658.

8-Hydroxy-s-tetramethylglutaric acid, action of hydriodic, hydrobromic, and sulphuric acids and nitrogen oxides on; and its isomeride (MICHAILENKO and JAVORSKY), A., i, 586.

3-Hydroxy-o-tolualdehyde and its oxime (AUWERS), A., i, 96; (AUWERS and BURROWS), A., i, 99.

5-Hydroxy-o-tolualdehyde, 3:4:6-*tri*- and *aa*:3:4:6-*penta*-bromo- and its acetyl and benzoyl derivatives and oxime (AUWERS), A., i, 96; (AUWERS and BURROWS), A., i, 98.

Hydroxytoluic acid (Me:OH:CO₂H:Br=1:2:3:5) (THIELE and EICHWEDE), A., i, 501.

3-Hydroxy-o-toluic acid, 4:6-*di*bromo- (AUWERS and BURROWS), A., i, 99.

p-Hydroxytoluic acid (*p-cresotic acid*), phenylester, reactions of, with phenols (COHN), A., i, 548.

Hydroxytoluic acids, their esters and nitro- and amino-derivatives (EINHORN), A., i, 439.

p-Hydroxytoluquinone and its acetyl derivative (THIELE and WINTER), A., i, 505.

2-Hydroxy-1-tolyl-4:4:6-trimethyl-dihydropyrimidine (TRAUBE and SCHALL), A., i, 118.

1-Hydroxy-1:2:3-triazole-4:5-dicarboxylic acid (*aziminolethylenedicarboxylic acid*) and its salts (ZINCKE and SCHWARZ), A., i, 528.

8-Hydroxy- $\alpha\beta$ -trimethyladipic acid and its esters (BLAISE), A., i, 329.

7(1)-Hydroxy-2:4:4-trimethyl-3:4-dihydroquinoline (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.

γ -Hydroxyvaleric acid, 8-amino-, barium salt of (EMMERLING), A., i, 16.

lactam of. See 3-Hydroxypiperidone.

4-Hydroxy-m-xylene glycol, tribromo-, and its methyl ether (AUWERS and HAMPE), A., i, 96.

Hydroxy-o-xylene glycols, tribromo-, and their ethers (AUWERS and EGGELT), A., i, 97.

Hygic acid (1-methylpyrrolidine-2-carboxylic acid), synthesis of (WILLSTÄTTER), A., i, 405.

Hyoscine, constitution of (HESSE), A., i, 50; (GADAMER), A., i, 356.

i-**Hyoscine**. See Atroscine.

Hyoscyamine, constitution of (HESSE), A., i, 50; (GADAMER), A., i, 356.

Hyoscyamus niger, estimation of the alkaloids of the leaves of (SCHMIDT), A., ii, 379.

Hyperacids, thermochemistry of (PISSARJEWSKY), A., ii, 466.

Hypnal, estimation of (BOUGAULT), A., i, 311.

I.

Ice calorimeter, Bunsen's (MELLOR), A., ii, 334.

Iceland spar as a standard in volumetric analysis (MASSON), A., ii, 436; (THIELE and RICHTER), A., ii, 620.

Iditol, *d*- and *l*-, benzylidene and methylene derivatives of (DE BRUYN and ALBERDA VAN EKENSTEIN), A., i, 382.

compounds of, with formaldehyde (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.

***l*-Idonic acid**, compound of, with formaldehyde (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.

***l*-Idosaccharic acid**, compound of, with benzaldehyde (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.

Imidosulphites (DIVERS and OGAWA), P., 1900, 113.

- Imino-chlorides**, decomposition of (v. PECHMANN and OBERMILLER), A., i, 294.
- Iminodicarboxylic acid**, oxime of (*imino-hydroxamic acid*) (BAMBERGER and MÜLLER), A., i, 145.
- Imine-ethers**, molecular rearrangement of, by heat (WISLICENUS and GOLDSCHMIDT), A., i, 435.
- action of alkyl iodides on (WHEELER), A., i, 293.
- reactions of, with phenylcarbimide, phenylthiocarbimide and acylthiocarbimides (WHEELER and SANDERS), A., i, 563.
- Incineration**, apparatus for (TUCKER), A., ii, 52; (SHUTTLEWORTH and TOLLENS), A., ii, 111; (SHUTTLEWORTH), A., ii, 372.
- Indene**, new syntheses of (KIPPING and HALL), T., 467; P., 1900, 54.
- alkylation of (MARCKWALD), A., i, 434.
- condensation product of (THIELE), A., i, 347.
- Indenexalic acid** and its ethyl ester (WISLICENUS), A., i, 346; (THIELE), A., i, 347.
- Indene resin** (KRAEMER and SPILKER), A., i, 656.
- Indexing chemical literature**, system of (HILL), A., ii, 648.
- Indiarubber**. See Caoutchouc.
- Indican** (BEYERINCK), A., i, 230, 403; (HAZEWINKEL), A., i, 403; (HOOGWERFF and TER MEULEN), A., i, 404.
- occurrence of, in the chlorophyll grains of the indigo plant (MOLINCH), A., ii, 101.
- oxidation product of, in urine (COTTON), A., ii, 293.
- detection of, in pathological urine (KLETT), A., ii, 776.
- estimation of, in urine (WANG), A., ii, 122; (BOUMA), A., ii, 700.
- Indican enzyme**. See under Enzymes.
- Indicanuria** produced by the administration of oxalates (HARNACK and v. D. LEYEN), A., ii, 422.
- Indicator**, new, for acidimetry (WOLFF), A., ii, 435.
- alizarin-green-B as an (FORMÁNEK), A., ii, 435.
- ferric isopyrottritarate as an (SIMON), A., i, 625.
- p-nitrophenol as an (SPIEGEL), A., ii, 754.
- perezone as an (DUYK), A., ii, 308.
- Indicators**, wide occurrence of, in nature (FRAPS), A., ii, 754.
- See also Analysis.
- Indigo**, formation of, from Indigoferae and from *Marsdenia tinctoria* (VAN ROMBURGH), A., i, 230.
- distinction of, from other blue dyes on fabrics (VAN LEENT), A., ii, 457.
- assay of (CLAUSER), A., ii, 180.
- Indigotin**, formation of, from diphenyl-diketopiperazine (KUHARA and CHIKASHIGE), A., i, 560.
- formation of, from ethyl anthranilate (VORLÄNDER and KOETTNITZ), A., i, 649.
- formation of, from woad (BEYERINCK), A., i, 230, 403, 649.
- crystalline form of (KLEY), A., i, 346.
- fusion of, with potassium hydroxide (HENTSCHEL), A., i, 231.
- oxidation of (v. GEORGEVICS and SPRINGER), A., i, 560.
- Indigotintrisulphonic acid**, salts of (HÖNIG), A., i, 231.
- Indigo-white**, crystalline (BINZ and RUNG), A., i, 560.
- Indium**, microchemical detection of (HUYSE), A., ii, 245.
- Indoles**, substituted, action of alkyl iodides on (PLANCHER), A., i, 560.
- Indoline bases**, syntheses of (BRUNNER), A., i, 360.
- 1-Indene, 3-bromo-, and its oxime (SCHLOSSBERG), A., i, 665.
- Indonecyanoacetamide**, chloro-, and **Indonedicarboxyloglutaseonic acid**, bromo-, ethyl ester (LANSER and WIEDERMANN), A., i, 666.
- Indonecyanoacetic acid**, ethyl ester (SCHLOSSBERG), A., i, 666.
- Indonemalonic acid**, chloro-, derivatives of (LANSER and WIEDERMANN), A., i, 666.
- Indoneresorcinol ether**, bromo-, and its acetyl derivative (LANSER and WIEDERMANN), A., i, 667.
- Indoxylanilide** (VORLÄNDER and WEISSBRENNER), A., i, 295.
- Induline dyes**, electrolytic preparation of (SZARVASY), T., 207; P., 1899, 194.
- Infants**, new-born, chemical composition of (CAMERER and SÖLDNER), A., ii, 290.
- comparison of the feeding of, on human and cows' milk (MÜLLER), A., ii, 422.
- naturally and artificially fed, mineral metabolism in (BLAUBERG), A., ii, 669.
- metabolism in (CAMERER and SÖLDNER), A., ii, 222.
- excretion of sulphur by (FREUND), A., ii, 226.

- "Influence,"** thermal value of the coefficient of (DE FORCRAND), A., ii, 527, 528.
- Infusion** after severe hæmorrhage (DAWSON), A., ii, 291, 417.
- Infusoria**, action of fluorescent substances on (RAAB), A., ii, 425.
effect of stimuli on (GARREY), A., ii, 158; (JENNINGS), A., ii, 158, 425.
- Inorganic compounds**, constitution of (WERNER, MÜLLER, KLIEN, and BRÄUNLICH), A., i, 86.
substances, phosphorescence of (GOLDSTEIN), A., ii, 702.
- Inositol**, physiological rôle of (POSTERNAK), A., ii, 679.
- Intestinal contents**, chemical reaction of (MOORE and BERGIN), A., ii, 154.
- Intestine**, absorption and excretion of iron by the (ABDERHALDEN), A., ii, 223, 289, 416; (HOFMANN), A., ii, 491.
absorption of sugars in the (HÉDON), A., ii, 223.
large, absorption of fats and soaps in the (HAMBURGER), A., ii, 418.
small, absorption in the (COHNHEIM), A., ii, 289.
absorption of saline solutions by the (WALLACE and CUSHNY), A., ii, 31.
excretion in the (CORLETTE), A., ii, 673.
human, relative digestibility of certain fats in the (LÜHRIG), A., ii, 224, 355, 667.
sandy matter from the (THOMSON and FERGUSON), A., ii, 228.
reduction of cholesterol to coprosterol in the (MÜLLER), A., ii, 289.
- Intramolecular change** of bromodiazonium chloride into chlorodiazonium bromide (HANTZSCH and SMYTHE), A., i, 315.
rearrangement (AUWERN), A., i, 492.
- Inulin** from chicory (WOLFF), A., ii, 37.
glycogen-forming properties of (NAKASEKO), A., ii, 670.
- Invertase**, presence of, in some plants of the Gramineæ (O'SULLIVAN), T., 691; P., 1900, 61.
- Iodine** in corals (MENDEL), A., ii, 677.
recovery of, from the residues obtained in the preparation of zinc ethyl (LACHMAN), A., i, 542.
atom, configuration of the (KIPPING and PETERS), P., 1900, 62.
molecular weight of, in various solvents (ODDO and SERRA), A., ii, 73.
action of, on aconitine and caffeine (KIPPENBERGER), A., ii, 777.
- Iodine**, action of, on alkalis (TAYLOR), T., 725; P., 1900, 70.
action of, on gaseous ammonia (HUGOT), A., ii, 274.
behaviour of, with mercuric oxide (ORTON and BLACKMAN), T., 835; P., 1900, 104.
action of persulphates on (MARSHALL), A., ii, 203.
in the blood (GLEY and BOURCET), A., ii, 555.
in the thymus and thyroid (MENDEL), A., ii, 152.
in the thyroid of dogs (GLEY and BOURCET), A., ii, 555.
of the thyroid of infants, variations of the (CHARRIN and BOURCET), A., ii, 419.
influence of, on the circulation (BARBERA), A., ii, 291.
metabolism of (GAUTIER; BOURCET), A., ii, 670.
absorption of, by plants (BOURCET), A., ii, 100.
- Iodine compounds**, effect of very low temperatures on the colour of (KASTLE), A., ii, 526.
- Iodine mono- and tri-chloride**, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 73.
monochloride, reaction of, with alkalis (ORTON and BLACKMAN), T., 830; P., 1900, 103.
- Hydriodic acid** (*hydrogen iodide*), and metallic iodides, action of, on sulphur dioxide (PÉCHARD), A., ii, 398; (BERG), A., ii, 535; (VOLHARD), A., ii, 650.
- Iodides**, absorption of, by the skin (GALLARD), A., ii, 419.
- Iodic acid**, use of, in analysis (JÖRGENSEN), A., ii, 620.
detection of, in presence of chloric, perchloric, bromic, and periodic acids, by means of morphine sulphate (REICHARD), A., ii, 685.
- Iodates and hypiodites**, estimation of (ORTON and BLACKMAN), T., 830; P., 1900, 103.
- Iodine compounds**, organic, heats of combustion and formation of (BERTHELOT), A., ii, 387.
- Iodides**, aromatic, oxidation of, by Caro's reagent (BAMBERGER and HILL), A., i, 281.
- Iodine**, detection, estimation, and separation of:—
starch test for (NORRIS and FAY), A., ii, 272.
estimation of (AUZENAT), A., ii, 366.
estimation of, electrometrically (CROTOGINO), A., ii, 642.

- Iodine, detection, estimation and separation of:**—
 estimation of, in presence of bromine and chlorine (V. WESZELSKY), A., ii, 436.
 separation of, from bromine and chlorine (CROTOGINO), A., ii, 642.
 separation of, from chlorine (VANINO and HAUSER), A., ii, 165.
- Iodine reaction, Florence's (STRUVE), A., ii, 328.**
- Iodoform, electrolytic synthesis of (DONY-HÉNAULT), A., i, 577.**
 estimation of, volumetrically, in dressings (LEHMANN), A., ii, 372, 767.
- Iodoso- and Iodoxy-compounds, preparation of (WILLGERODT), A., i, 339; (ORTOLEVA), A., i, 592.**
- Iodethyria, influence of, on the circulation (BARBERA), A., ii, 291.**
- Ionone, examination of violet preparations for (SCHMIDT), A., ii, 375.**
- ψ -Ionone from citral (TIEMANN), A., i, 331.**
- Ions. See Electrochemistry.**
- Iretol, and its triacetyl derivative (KÖHNER), A., i, 224.**
- Iridium sesquichloride (LEIDIÉ), A., ii, 146.**
 estimation of, in alloys of the noble metals (MIETZSCHKE), A., ii, 371.
- Iron in Disko Island, W. Greenland, possible formation of (WINKLER), A., ii, 598.**
 atomic weight of (RICHARDS and BAXTER), A., ii, 407.
 heat of solution of (CAMPBELL), A., ii, 407.
 passivity of (HITTORF), A., ii, 705.
 from the standpoint of the phase rule (ROOZEBOOM), A., ii, 728.
 behaviour of, with hydrogen (HEYN), A., ii, 728.
 function of, in oxidation processes (SARTHOU), A., i, 576.
 amount of, in the hemoglobin of the horse (LAPICQUE and GILARDONI), A., i, 467.
 rôle of, in blood formation (ABDERHALDEN), A., ii, 223, 289, 416; (HOFMANN), A., ii, 491.
 accumulation of, in peat (VAN BEMMELEN, HOITSEMA and KLOBBIE), A., ii, 215.
- Iron alloys with carbon, Osmond and Roberts-Austen's theory of (HEYN), A., ii, 657.**
 with nickel, allotropic transformations of (DUMAS), A., ii, 408.
 estimation of phosphorus in (IBBOTSON and BREARLEY), A., ii, 757.
- Iron salts, hydrolysis of (RICHARDS), A., ii, 472.**
 solubility of, in sucrose solutions (STOLLE), A., i, 333.
 action of sodium thiosulphate on (FAKTOR), A., ii, 692.
- Iron carbonyls, and their importance in the industrial application of water-gas (VAN BREUKELEVEEN and TER HORST), A., ii, 348.**
 pyrophosphate, soluble, test for the purity of (RIDENOUR), A., ii, 444.
 phosphide, preparation of (MARONNEAU), A., ii, 281.
 tungsten phosphide (DEFACQZ), A., ii, 350.
 selenides (FONZES-DIACON), A., ii, 546.
 silicide, Fe_2Si , and its presence in ferro-silicons (LEBEAU), A., ii, 729.
- Ferric chloride, compound of, with nitrosyl chloride (VAN HETEREN), A., ii, 137.**
 action of organic solvents on solutions of (OECHSNER DE CONINCK), A., i, 535.
 fluoride, double salts of, with ferrous, cobalt, nickel, or zinc fluorides (WEINLAND and KÖPFEN), A., ii, 143.
 oxide, ignited, rapid solution of, in hydrochloric acid (BORNTRÄGER), A., ii, 171.
 solution obtained by dialysis (WOBBE), A., ii, 281.
 estimation of, in natural phosphates (VEITCH), A., ii, 577.
 sulphate, basic, $\text{Fe}_2\text{S}_2\text{O}_5$ (SCHARIZER), A., ii, 349.
- Ferrous fluoride, double salts of, with aluminium or ferric fluoride (WEINLAND and KÖPFEN), A., ii, 143.**
 iodide, and its compound with ammonia (JACKSON and DERBY), A., ii, 596.
 syrup of, volumetric valuation of (RUPP), A., ii, 580.
 cadmium sulphates, solubility of (STORTENBEKER), A., ii, 530.
- Iron organic compounds:—**
 Iron compounds, *pentacyano*, preparation and nomenclature of (HOFMANN), A., i, 591.
- Ferrous cyanide, constitution of (BROWNING), T., 1236; P., 1900, 172.**
- Iron ores, estimation of titanium in (BRAKES), A., ii, 248.**
 magnetic, from Eastern Ontario (POPE), A., ii, 409.
 titaniferous, analysis of (BASKERVILLE), A., ii, 629.

Iron ores:—

Steel, tempered and untempered, constitution of; influence of tempering on the state of combination of elements other than carbon (CARNOT and GOUTAL), A., ii, 545.

heat of solution of (CAMPBELL), A., ii, 407.

from the standpoint of the phase rule (ROOZEBOOM), A., ii, 728.

Steel alloys, estimation of phosphorus in (IBBOTSON and BREARLEY), A., ii, 757.

Steel, estimation of carbon in (SARGENT; AUCHY; BLOUNT), A., ii, 574.

estimation of carbon in, treatment of copper potassium chloride for the (SARGENT), A., ii, 440.

estimation of chromium in (DÖHLER; MAHON), A., ii, 110.

estimation of manganese in (NAMIAS), A., ii, 50; (JERVIS), A., ii, 444.

estimation of manganese in, volumetrically (MIGNOT), A., ii, 690.

estimation of molybdenum in (IBBOTSON and BREARLEY), A., ii, 766.

estimation of phosphorus in (IBBOTSON and BREARLEY), A., ii, 757.

containing arsenic, estimation of phosphorus in (CAMP), A., ii, 757.

Iron (in general), estimation and separation of:—

relative values of the Mitscherlich and hydrofluoric acid methods for the estimation of ferrous (HILLEBRAND and STOKES), A., ii, 763.

apparatus for the estimation of (SHIMER), A., ii, 50.

estimation of carbon in (SARGENT; AUCHY; BLOUNT), A., ii, 574.

estimation of graphitic carbon in (FORD and BREGOWSKY), A., ii, 168.

estimation of carbon in, treatment of copper potassium chloride for the (SARGENT), A., ii, 440.

estimation of carbon, copper and manganese in (HERTING), A., ii, 245.

estimation of chromium in (DÖHLER), A., ii, 110.

estimation of manganese in (NAMIAS), A., ii, 50; (HERTING), A., ii, 245.

estimation of manganese in, volumetrically (MIGNOT), A., ii, 690.

estimation of molybdenum in (DÖHLER), A., ii, 691.

containing arsenic, estimation of phosphorus in (CAMP), A., ii, 757.

Iron (in general), estimation and separation of:—

estimation of sulphur in (MOORE), A., ii, 106; (RIEMER), A., ii, 309; (BLOUNT), A., ii, 574.

estimation of, in tap cinder (BLUM), A., ii, 512.

separation of, from chromium, zirconium, and beryllium (HAVENS and WAY), A., ii, 50.

Iron group, molecular susceptibility of salts of the (DU BOIS and LIEBKNECHT), A., ii, 128; (LIEBKNECHT and WILLS), A., ii, 187.

Isatan (BEYERINCK), A., i, 649.

Isatase (BEYERINCK), A., i, 649.

Isatin, action of *o*-phenylenediamine acetate on (MARCHLEWSKI), A., i, 100.

Isatis tinctoria. See Wood.

Isatoic anhydride, formation of (BREED and HOF), A., i, 229.

Isomorphism in Mendeléeff's system (BEHRENS), A., ii, 136.

of salts of ammonium, hydroxylamine, and hydrazine (SABANÉEFF), A., ii, 13.

of red and yellow mercuric oxides (COHEN), A., ii, 184, 381; (OSTWALD), A., ii, 712.

in the aromatic series (OECHSNER DE CONINCK), A., i, 592.

of the formylphenylacetic esters (WISLICENUS), A., i, 597.

in the menthol series (KONDAKOFF and LUTSCHININ), A., i, 104, 604.

space, of the ethers of toluquinone-oxime (MORGAN), A., i, 103.

Isomorphous mixtures and solid solutions (BRUNI), A., ii, 196.

physical equilibrium in (BRUNI and GORNI), A., ii, 197.

of saturated and non-saturated open-chain compounds (BRUNI and GORNI), A., ii, 714.

Isoprene. See Pentinene.

Isotherms and Isochores for systems involving dissociation, deduction of reaction (IKEDA), A., ii, 386.

Ivaarite from Finland (HACKMAN), A., ii, 664.

J.

Jaborandi leaves, alkaloids of (JOWETT), T., 473; P., 1900, 49.

Jaborine (JOWETT), T., 473; P., 1900, 50.

Jadeite from Piedmont (PIOLTI), A., ii, 487.

Japacanine, preparation, composition, properties and salts of (DUNSTAN and READ), T., 58; P., 1899, 207.

Japaconitine, extraction, composition, properties, hydrolysis, salts, and physiological action of (DUNSTAN and READ), T., 47; P., 1899, 206.

Japanic acid (GRITEL and VAN DER WANT), A., i, 271.

Japbensaconine, preparation, properties, hydrolysis and salts of (DUNSTAN and READ), T., 55; P., 1899, 207.

Jasmine, oil of (HESSE), A., i, 48; (WALBAUM), A., i, 509; (JEAN-CARD and SATIE), A., i, 510.

blossom, oil of (HESSE), A., i, 454.

Jasnone, and its oxime and semicarbazone (HESSE), A., i, 48.

Johnstonotite from Tasmania (MACLEOD and WHITE), A., ii, 663.

Jordanite from the Binnenthal (SOLLY and JACKSON), A., ii, 599.

Juniper, empyreumatic oil of (CATHELINEAU and HAUSSER), A., i, 510.

K.

Kaempferia Galanga, oil of (VAN ROMBURGH), A., i, 677.

Kaolinite from Moravia (KOVÁK), A., ii, 148, 149.

from Westanå, Sweden (WEIBULL), A., ii, 286.

Kelyphite from Steinegg, Austria (MRHA), A., ii, 218.

Ketochlorides of aziminobenzene (ZINCKE, STOFFEL, and PETERMANN), A., i, 524.

Ketoprop-cinchonine and -homocinchonine, ethyl ethers of (KOENIG), A., i, 246.

4-Ketodihydroquinazolines, synthesis of (BOGERT and GOTTHELF), A., i, 412, 608.

2-Ketohexamethylenecarboxylic acid. See 2-cyclohexanonecarboxylic acid.

Ketohydrindene, diiodo- (LIEBERMANN and FLATOW), A., i, 667.

Ketohydroxytriphenyltetrahydrobenzene, oxime of, compound of, with certain solvents (PETRENKO-KRITSCHENKO and KASANEZKY), A., i, 350.

Ketolactone, $C_{10}H_{16}O_3$, from isothujone (SEMMLER), A., i, 240.

α -Ketonaphthalene, β -tetrachloro-, phototrophy of (MARCKWALD), A., ii, 2.

Ketone, $C_{10}H_{16}O$, from isofenchyl alcohol (BERTRAM and HELLE), A., i, 399.

$C_{21}H_{40}O$, from heating japanic acid (GRITEL and VAN DER WANT), A., i, 272.

Ketone, $C_{22}H_{40}O_2$, from heating the product of dibenzyl ketone and benzaldehyde (GOLDSCHMIEDT and KNÖPFER), A., i, 36.

$COEt \cdot C_6H_5(OMe) \cdot OPr$, from isoeugenol dibromide and sodium methoxide (POND, MAXWELL, and NORMAN), A., i, 102.

$COEt \cdot C_6H(OMe)_2 \cdot O : CH_2$, from isopiole dibromide and sodium methoxide; and its oxime (POND, MAXWELL, and NORMAN), A., i, 102.

Ketones, formation of, from acid chlorides by means of aluminium chloride (PERRIER), A., i, 331; (BOESEKEN), A., i, 349.

from the dibromides of propenyl compounds, and of unsaturated ketones (POND, MAXWELL, and NORMAN), A., i, 102.

new synthesis of (WEDEKIND), A., i, 665.

electro-synthesis of (HOFER), A., i, 275.

condensation products of, with α -aldehydic acids, properties of (FULDA), A., i, 36.

alkylation of (NEF), A., i, 349.

reactions of, with alkyl nitrites, in presence of excess of alcoholic hydrogen chloride (KISSEL), A., i, 620.

action of Caro's reagent on (v. BÄYER and VILLIGER), A., i, 133, 206, 328, 627.

action of ethyl cyanoacetate and ammonia on (GUARESCHI and GRANDE), A., i, 111; (MINOZZI), A., i, 407.

of the type $CO(CH:CHR)_2$, action of hydroxylamine hydrochloride on, in presence of sodium acetate (MINUNNI and CARTA-SATTA), A., i, 237.

condensation of, with nitromalonaldehyde (HILL, SOCH, and OENSLAGER), A., i, 538.

conversion of, into α -diketones (PONZIO), A., i, 588.

cyclic, ring disruption among (WALLACE), A., i, 44, 589.

condensation of, with ethyl succinate (STOBBE and FISCHER), A., i, 179.

isomeric, separation of (MICHAEL), A., i, 321.

amino-, formation of alkali salts of (WILLSTÄTTER and BODE), A., i, 245.

aromatic, new method of preparing (KUNCKELL), A., i, 664.

halogenised (KUNCKELL), A., i, 663.

Ketones, dichloro-, formation of, by the action of hypochlorous and hypobromous acids on acetylene and its mono-substituted derivatives (WITTORF), A., i, 421.

 β -isoPropylheptane- ϵ -oleic acid, lactone of.

Strophanthidolactone.

Tetramethyl-6:7-dihydroquino-coumarin.

Trihydroxybutyric acid, lactone of.

- Lactones.** See :—
 Triphenylcrotonolactone.
 Xylonic lactone.
- Lactopheninsulphonic acid** (COHN), A., ii, 29.
- Lactose** (*milk sugar*), formation of, in the organism (MOORE and PARKER), A., ii, 671
 degradation of (RUFF and OLLEN-DORFF), A., i, 476.
 detection of sucrose in (LANDIN), A., ii, 514.
 estimation of, in milk (GALLIEN), A., ii, 324.
- Lævulinic acid** (*β -acetylpropionic acid*), mercury derivatives of (LEY), A., i, 382.
p-nitrophenylhydrazones of (FEIST), A., i, 569.
- Lävulomannan** from *Phytelephas macrocarpa*, and its dibenzoyl derivative (BAKER and POPP), T., 696; P., 1900, 72.
- Lävulose** (*fructose*) in beet leaves (LINDET), A., ii, 302.
 oxidation of, and compounds of, with the haloid salts of the alkaline earths (SMITH and TOLLENS), A., i, 378.
- Lamps** for spectra (BECKMANN), A., ii, 701.
- Langbeinite** from the Punjab (MALLET), A., ii, 22.
- Lapodin** from *Rumex palustris* and *R. obtusifolius* (HESSE), A., i, 41.
- Lard** and its substitutes, relative digestibility of, in the human intestine (LÜHRIG), A., ii, 355, 667.
- Larderellite** from the suffioni of Tuscany (D'ACHIARDI), A., ii, 600.
- Laricinolic and α - and β -Larinolic acids** (TSCHIRCH and WEIGEL), A., i, 680.
- Lariciresinol**, dry distillation of (BAMBERGER and VISCHNER), A., i, 605.
- iso*Lariciresinol, preparation, and tetraacetyl and dimethoxy derivatives of, and its isomeride (BAMBERGER and LANDSTEDL), A., i, 48.
- Larix decidua**, balsam of (TSCHIRCH and WEIGEL), A., i, 680.
- Lasur-oligoelase** from Lake Baikal (V. JEREMÉEFF), A., ii, 603.
- Latent image.** See Photochemistry.
- Laudanosine** (*d-N-methyltetrahydro-papaverine*) and its salts (PICTET and ATHANASESCU), A., i, 685.
- Laumontite** from Petersberg, near Halle (LUEDECKE), A., ii, 218.
- iso*Lauronic acid, constitution of (BLANC), A., i, 329.
- iso*Lauronolic acid (LEES and PERKIN), P., 1900, 18.
- iso*Lauronolic acid, constitution of (NOYES), A., i, 202; (BLANC), A., i, 581, 586.
 and its stereoisomeride, reactions and structure of (WALKER and CORMACK), T., 374; P., 1900, 58.
- Lavender**, development of terpenes in (CHARABOT), A., i, 241.
 oil of (JEANCARD and SATIE), A., i, 510.
- Law** of Cailletet and Mathias, and the critical density (YOUNG), A., ii, 711.
 of multiple proportions, lecture experiment on the (EMICH and DÖRNER), A., ii, 340.
- Lead**, sensitiveness of, to light (WATERHOUSE), A., ii, 585.
 equilibrium between zinc and, and mixtures of their fused chlorides (REINDERS), A., ii, 715.
- Lead compounds** with sodium, composition and melting point of (KURNAKOFF), A., ii, 277.
 analyses of (MENNIOKE), A., ii, 688, 761.
- Lead salts**, action of sodium thiosulphate on (FAKTOR), A., ii, 688, 691.
- Lead chlorate**, decomposition of (SODÉAU), T., 717; P., 1900, 88.
 tetrachloride and its double salts with amines (MEYER and BEST), A., ii, 78.
 dioxide, change of resistance of (SUNDORPH), A., ii, 5.
 triplumbic tetroxide (*minium*), estimation of (TOCHER), A., ii, 442.
- peroxide**, action of hydrogen sulphide on (VANINO and HAUSER), A., ii, 279.
 "peroxide" (KASSNER), A., ii, 725.
 selenides and chloroselenides (FONZES-DIAON), A., ii, 402.
 sulpharsenites. See Jordanite, Rathite, and Sartorite.
 polysulphide (BODROUX), A., ii, 480.
 thioantimonite and its double salt with potassium (POUGET), A., ii, 84.
- Lead organic compound** :—
 ferrocyanide (MILLER and FISHER), A., ii, 761.
- Lead, estimation and separation of** :—
 dry assay of (FLATH), A., ii, 512.
 electrolytic estimation of, in the sulphate and chromate, and in lead glass (MARIE), A., ii, 368.
 estimation of, in zinc (MACKAY), A., ii, 49.
 separation of, from bismuth (CLARK), A., ii, 371.
- Leather**, specific heat of (FLEURY), A., ii, 188.

- Leather**, analysis of (FAHRION), A., ii, 59.
- Lecithin**, preparation of (BERGELL), A., i, 621.
- Lees**, polarimetric estimation of sugars in (PELLER), A., ii, 113.
- Leguminosæ**. See Agricultural Chemistry.
- Lekene** from the wax of Bacillariaceæ (KRAEMER and SPILKER), A., i, 73.
- Lemon**, oil of, properties of (SOLDAINI and BERTÉ), A., ii, 173.
valuation of (WALTHER), A., ii, 173.
flavouring extracts and its substitutes, valuation of (MITCHELL), A., ii, 174.
- Lemonade essences**, testing (WENDER and GREGOR), A., ii, 767.
- Lentil seedlings**, proteolytic ferment of (HARLAY), A., ii, 744.
- Lepidium sativum**, constituents of (GADAMER), A., i, 49.
- Lepidolite**, cæsium and rubidium salts from (FORMÁNEK), A., ii, 15.
- 2-Lepidyl-hydrasine**, -phenylthiosemicarbaside, and -semicarbaside (MARCKWALD and CHAIN), A., i, 521.
- Lettuce**. See Agricultural Chemistry.
- Leucæmia**, metabolism in (v. STEJSKAL and ERBEN), A., ii, 423.
- Leucine**, derivatives of (FISCHER), A., i, 647.
- L-Leucine** (WALLACH), A., i, 590.
- Leucinimide**, constitution of, and base $C_{12}H_{28}N_2$, from (COHN), A., i, 466.
- Leucite**, action of ammonium chloride on (CLARKE and STEIGER), A., ii, 219.
- Leuco-base**, $C_{18}H_{24}N_2$, action of nitrous acid on (TRILLAT), A., i, 192.
- Leucocytes**, rôle of, in poisoning by arsenic (BESREDEKA), A., ii, 156.
decomposition products of histon from (LAWROFF), A., i, 71.
- Leucomethylene-blue**, acyl derivatives of (COHN), A., i, 455.
- Leucophanite** from New Jersey (PENFIELD and WARREN), A., ii, 89.
- Leucosphenite** from Greenland (FLINK), A., ii, 411.
- Leucotoxin** (BESREDEKA), A., ii, 741.
- Leverrierite** from Rochebelle, Gard (TERMIER), A., ii, 86.
- Libollite** from Portuguese West Africa (GOMES), A., ii, 86.
- Light**, polarised, method of showing the properties of (UMOFF), A., ii, 181.
influence of, on the respiration of lower Fungi (KOLKOWITZ), A., ii, 861.
effect of, filtered through leaves, on chlorophyll assimilation (GRIFFON), A., ii, 159.
- Light**, influence of, on the production of proteids in plants (PALLADIN), A., ii, 612.
See also Photochemistry.
- Lime**. See Calcium oxide, and Agricultural Chemistry.
- Limestone**, estimation of calcium in, photometrically (HINDS), A., ii, 575.
- Limestones** from Moravia (KOVÁK), A., ii, 147, 148.
- d-Limonene** from carvone (TSCHUGAEFF), A., i, 352.
- Limonenes**, ψ - and σ -, formulæ of (SEMMIER), A., i, 453.
- Limonite** from Moravia (KOVÁK), A., ii, 148.
pseudomorphs from Dutch Guiana (RAYMOND), A., ii, 86.
- Linalool-group**, metamorphoses and migrations of compounds of the, in plants (CHARABOT), A., i, 241; ii, 101, 361, 862.
- Linseed oil**, analysis of (McILHINEY), A., ii, 633.
- Liparite** from Sumatra (MILCH), A., ii, 150.
- Liquefaction** of a gas by "self-cooling" (NEWTN), P., 1900, 87.
of gaseous mixtures (CAUBET), A., ii, 191, 390, 646.
- Liquids**, absorption spectra of, in the ultra-red (PUCCIANTI), A., ii, 585.
transparency of, to electric oscillations (DE HEEN), A., ii, 524.
equation of condition for; determination of the constants a and b of van der Waal's equation (GUYE and FRIDERICH), A., ii, 709.
van't Hoff's equation and molecular weights of (SPRYERS), A., ii, 10.
molecular association in (BERTHELOT), A., ii, 335, 337.
minimum volume of (GULDBERG), A., ii, 264; (BERTHELOT), A., ii, 335.
supercooled, velocity of solidification and viscosity of (WILSON), A., ii, 712.
organic, surface tension of (DUTOIT and FRIDERICH), A., ii, 194.
flocculation of (SPRING), A., ii, 713.
reciprocal solubility of (BRUNI), A., ii, 196.
fermented, estimation of succinic acid in (LABORDE and MOREAU), A., ii, 114.
- Liquorice extract**, estimation of glycyrrhizin in (HAFNER), A., ii, 328, 775.
pastes, analysis of (TRUEBECK), A., ii, 378.
- Lithium** in plants (TSCHERMAK), A., ii, 235.

Lithium, preparation of metallic (KAHLENBERG), A., ii, 206.
 melting point of (KAHLBAUM), A., ii, 277.
Lithium amalgam (KEPP and BÖTTGER), A., ii, 656.
Lithium aluminates (ALLEN and ROGERS), A., ii, 727.
 antimonide, arsenide, bismuthide, and stannide (LEBEAU), A., ii, 276.
 bromide and iodide, temperature of maximum density of solutions of (DE COPPET), A., ii, 529.
 compounds of, with gaseous ammonia (BONNEFOI), A., ii, 478.
 chloride and nitrate, electrical conductivity of solutions of (KOHLEBAUSCH and MALTEY), A., ii, 61.
 compounds of, with ethylamine (BONNEFOI), A., ii, 130.
 peroxide and its hydrate, thermochemistry of (DE FORCRAND), A., ii, 478.
 thioantimonites and double salts with silver (POUGET), A., ii, 84.
Lithium-tungsten bronze (STAVENHAGEN), A., ii, 80.
Liver, aldehyde from the (JACOBY), A., i, 711.
 constituents of the, which form sugars (SEEGEN), A., ii, 29.
 formation of ammonia in the, and changes in the, during phosphorus-poisoning (JACOBY), A., ii, 671.
 urea in the (GOTTLIEB), A., ii, 29.
 results of the extirpation of, in dogs (SALASKIN and ZALESKI), A., ii, 607.
Liver extracts, action of, on salicylaldehyde (MEDVEDEFF), A., ii, 738.
Liverworts, chemistry of the cell membranes of (CZAPEK), A., i, 556.
Löllingite from the Harz (SCHEIBE), A., ii, 661.
Lorenzenite from Greenland (FLINK), A., ii, 411.
Lotus corniculatus. See Agricultural Chemistry.
Lucerne. See Agricultural Chemistry.
Lucerne seeds, carbohydrates in (BOURQUELOT and HÉRISSEY), A., ii, 301.
 enzyme of (BOURQUELOT and HÉRISSEY), A., ii, 233.
Luminescence of ring compounds (KAUFFMANN), A., i, 480.
Luminosity of 1-ethyl-2-quinolone (DECKER), A., i, 688.
2:4-Lupetidine. See 2:4-Dimethylpiperidine.
Lupins. See Agricultural Chemistry.
Lupinus albus. See Agricultural Chemistry.

Luteolin, constitution and dimethyl ether of (PERKIN), P., 1899, 242.
 and its methyl ethers, decomposition products and salts of (PERKIN and HORSFALL), T., 1814; P., 1900, 181.
 methyl ether, and its triacetyl and tribenzoyl derivatives (VONGERICHTEN), A., i, 681.
Lutidine. See 2:6-Dimethylpyridine.
Lutidine (b. p. 148°-156°), from methylcyclohexanoneoxime (WALLACH), A., i, 45.
Lutidinedicarboxylic acid. See 2:6-Dimethylpyridine:3:5-dicarboxylic acid.
2:6-Lutidyl-. See 2:6-Dimethylpyridyl-.
2:4-Lutidylalkine. See 2-Hydroxyethyl-4-methylpyridine.
Lymph, properties and formation of (ASHER and GIES), A., ii, 673.
 influence of protoplasmic poisons on the formation of (GIES and ASHER), A., ii, 291.
 proteids of, action of lymphagogues on (TIMOFÉEFFSKY), A., ii, 95.
Lysine (HENDERSON), A., i, 571.
 from the proteid of conifer seeds (SCHULZE and WINTERSTEIN), A., ii, 101.
 from the proteid of *Lupinus luteus* seedlings (SCHULZE), A., ii, 101.
 constitution of (ELLINGER), A., i, 143; (HENDERSON), A., i, 571.
d-Lyxose and its phenylbenzylhydrazone (RUFF and OLLENDORFF), A., i, 476.
 action of hydrocyanic acid on (FISCHER and RUFF), A., i, 539.

M.

Macassar oil (WILS), A., ii, 252.
Macleynine. See Protopine.
Magenta, action of sodium hydroxide on (HANTZSCH), A., i, 365.
 compounds of, with acidic colouring matters, composition of (SEYEWETZ), A., i, 522.
 compounds of, with acidic colouring matters having a basic chromophore (SEYEWETZ), A., i, 645.
 compounds of, with sulpho-azo-colouring matters (SEYEWETZ), A., i, 614.
Magnesium, action of, on saline solutions (TOMMASI), A., ii, 16; (MOURAOUR), A., ii, 206.
 action of metallic, on water (BRYANT), A., ii, 278.
 metabolism of (LEIPZIGER), A., ii, 223.

- Magnesium alloy** with platinum (HODGKINSON, WARING, and DESBOROUGH), A., ii, 282.
- Magnesium salts**, influence of ammonia on (SCHIEBER), A., ii, 345.
- Magnesium ammonium arsenate** (ARSTIN), A., ii, 245.
- orthoborate* (OUVRARD), A., ii, 206.
- bromide, electrolysis of solutions of (SARGHEL), A., ii, 401.
- carbonate, anhydrous (ENGEL), A., ii, 17.
- ammonium phosphate, composition of (NEUBAUER; GOOCH and AUSTIN), A., ii, 108.
- potassium sulphate, hydrate of (VAN'T HOFF and KASSATKIN), A., ii, 284.
- potassium and magnesium rubidium sulphates (MALLET), T., 219, 223; P., 1899, 227.
- Magnesium new organo-metallic compounds** (BRIGNARD), A., i, 382.
- Magnesium, estimation of:**—
estimation of, volumetrically (MEADE), A., ii, 48; (HANDY), A., ii, 314.
- Magnetic behaviour of alcohols** (HEINRICH), A., ii, 707.
- of aromatic hydrocarbons (FREITAG), A., ii, 708.
- field, action of the, on Becquerel rays, and on rays from polonium and radium (CURIE), A., ii, 126.
- effect of the, on radium radiations (BECQUEREL), A., ii, 182, 183.
- influence of the, on rays from radioactive substances (BECQUEREL), A., ii, 126.
- pyrites. See Pyrrhotite.
- rotation. See Photochemistry.
- susceptibility, determination of some coefficients of (MEYER), A., ii, 385.
- of inorganic compounds (MEYER), A., ii, 7; (KÖNIGSBERGER), A., ii, 258.
- Magnetism**, atomic and molecular (MEYER), A., ii, 7, 385; (LANG), A., ii, 707.
- influence of, on chemical reactions (DE HEMPTINNE), A., ii, 707.
- molecular, of salts of the rare earths (DU BOIS and LIEBKNECHT), A., ii, 127, 333; (MEYER), A., ii, 186.
- of salts of the iron group (DU BOIS and LIEBKNECHT), A., ii, 128; (LIEBKNECHT and WILLS), A., ii, 187.
- Magnetite** from near Rome (ZAMBINI), A., ii, 147.
- Magnetites**, titaniferous (KEMP), A., ii, 283.
- Magnus' salt** (JÜRGENSEN), A., i, 542; (BILLMANN), A., i, 543.
- Maize and Maize gluten.** See Agricultural Chemistry.
- Maize oil** (*corn oil*), constants of (WILLIAMS), A., ii, 582.
- physical and chemical constants of (VULTE and GIBSON), A., ii, 697.
- adulteration of cotton seed oil with (MORPURGO and GÜTEL), A., ii, 377.
- Malic acid** from *Hippophaë rhamnoides* (ERDMANN), A., i, 135.
- optical rotation of, in the pure state and in solution (WALDEN), A., i, 11.
- oxidation of, in presence of ferrous salts (FENTON and JONES), T., 75; P., 1899, 224.
- oxidation of, by potassium permanganate (DENIGES), A., i, 204.
- estimation of (HILGER), A., ii, 768.
- estimation of, in tartar and grapes (ORDONNEAU), A., ii, 250.
- Malic acid**, beryllium alkali salts of (ROSENHEIM and ITZIG), A., i, 135.
- molybdo- and tungsto-alkali salts of, specific rotatory power of (ROSENHEIM and ITZIG), A., i, 272.
- l*-Malic acid, action of heat on (WALDEN), A., i, 10.
- Malic acids**, α - and β -, and their salts (ORDONNEAU), A., i, 203.
- Malonaldehyde**, nitro-, condensation of, with ketones and ketonic acids (HILL, SOCH, and OENSLAGER), A., i, 538.
- Malonamide**, action of nitrosyl chloride on, and of hydroxylamine on its dibromo-derivative (WHITELEY), T., 1040; P., 1900, 145.
- Malonic acid**, condensation of, with dibromo- α -naphthaquinone (LIEBERMANN), A., i, 310.
- action of iodine on a pyridine solution of (ORTOLEVA), A., i, 558.
- α -semi-aldehyde of (WOHL and EMMERICH), A., i, 627.
- Malonic acid**, ethyl ester, action of bromine and carbon disulphide on the sodium derivative of (WENZEL), A., i, 536.
- condensation of, with formaldehyde (BOTTOMLEY and PERKIN), T., 294; P., 1900, 16.
- condensation of the sodium derivative of, with ethyl $\alpha\alpha'$ -dibromo- $\beta\beta$ -dimethylglutarate (PERKIN, THORPE, and WALKER), P., 1900, 149.
- action of dry silver oxide and ethyl iodide on (LANDER), T., 743; P., 1900, 6, 90.
- Malt**, nitrogenous substances in (PETIT and LABOURASSE), A., ii, 680.

- Malt**, dissolution of the nitrogenous compounds in (PETIT and LABOURASSE), A., ii, 611.
 proteolytic diastase of (FERNBACH and HUBERT), A., ii, 576, 616.
 proteolytic enzyme of (WINDISCH and SCHELLHORN), A., i, 712.
- Malt-germ molasses**. See Agricultural Chemistry.
- Maltodextrin** (POTTEVIN), A., i, 81.
- isoMaltose**, Lintner's (POTTEVIN), A., i, 77.
- Mandarin**, oil of, methyl methylantranilate in (WALBAUM), A., i, 595.
- Manganese**, activity of, in promoting the phosphorescence of strontium sulphide (MOURELO), A., ii, 141.
- Manganese salts**, estimation of, by an alkaline solution of arsenious acid (REICHARD), A., ii, 109.
- Manganese borate** (OUVRARD), A., ii, 207.
 dibromide and tri- and tetra-chlorides (MEYER and BEST), A., ii, 77.
 chloride, stable hydrates of (DAWSON and WILLIAMS), A., ii, 210.
 tetrachloride, formation of (WACKER), A., ii, 470.
 chlorides, compounds of, with potassium chloride and with caesium chloride (MEYER and BEST), A., ii, 77.
 trifluoride (Mn_2F_6), preparation and properties of (MOISSAN), A., ii, 280.
 dioxide, formation of (WACKER), A., ii, 470.
 electrodes, potential differences with (TOWER), A., ii, 331.
 oxide, $22MnO_2 \cdot MnO \cdot xH_2O$ (CHRISTENSEN), A., ii, 596.
- Manganic acids**, estimation of, by an alkaline solution of arsenious acid (REICHARD), A., ii, 109.
- Permanganic acid**, preparation of, by electrolysis (MORSE and OLSEN), A., ii, 482.
- Permanganomolybdates** (FRIEDHEIM and SAMELSON), A., ii, 547.
 selenide and oxyselenide (FONZES-DIAON), A., ii, 348.
 copper sulphates, solubility of (STORTENBEKER), A., ii, 530.
 potassium sulphate (MALLET), T., 221; P., 1899, 227; (MEYER and BEST), A., ii, 78.
 thioantimonite and its double salt with potassium (POUGET), A., ii, 84.
- Manganous salts and ammonia**, equilibrium between (HERZ), A., ii, 68.
- Manganous fluoride**, MnF_2 (MOISSAN and VENTURI), A., ii, 405.
- Manganous iodide**, hydrates of (KUTZ NETZOFF), A., ii, 657.
- Manganese organic compounds**:—
 compounds of, with acetic acid (MEYER and BEST), A., ii, 77.
- Manganese, estimation of**:—
 estimation of, as pyrophosphate (BÖTTGER), A., ii, 443.
 estimation of, as sulphide (J. and H. S. PATTINSON), A., ii, 443.
 estimation of, in iron (HERTING), A., ii, 245.
 estimation of, volumetrically, in pig-iron, cast-iron, and steel (MIGNOT), A., ii, 690.
 estimation of, volumetrically, in iron or steel (NAMIAS), A., ii, 50.
 estimation of, in steel (JERVIS), A., ii, 444.
 estimation of, electrolytically, in manganese ores (HIORNS), A., ii, 444.
- Manganese ore** from the Amazon district (KATZER), A., ii, 733.
- Manganese nodules** from New South Wales (DOHERTY), A., ii, 283.
- Manganocalcite** from Chemnitz. See Angolite.
- Mangel-wurzel**. See Agricultural Chemistry.
- d-Mannitol**, compounds of, with nitrobenzaldehydes (ALBERDA VAN EKENSTEIN and DE BRUYN), A., i, 619.
- Mannocellulose** in the tissues of gymnosperms (BERTRAND), A., ii, 610.
- Mannogalactan** from *Strychnos potatorum* and its dibenzoyl derivative (BAKER and POPE), T., 696; P., 1900, 72.
 from the seeds of *Trifolium repens* (HÉRISSEY), A., ii, 561.
- Mannose**, production of, by an enzyme (BOURQUELOT and HÉRISSEY), A., ii, 35, 233; (HÉRISSEY), A., ii, 561.
 from the albumen of the St. Ignatius bean and nux vomica (BOURQUELOT and LAURENT), A., ii, 498, 611.
 from invertin (KÖLE), A., i, 572.
- Manometer**, differential, new (BLEIER and KOHN), A., ii, 192.
- Manostat** (SMITS), A., ii, 388.
- Mantles**, luminosity of, of mixtures of ceria and thoria (THIELE), A., ii, 208.
- "Manur"**—a cheese from Servia (ZEGA), A., ii, 503.
- Manures**, estimation of potash in (ADIE and WOOD), T., 1079; P., 1900, 17.
 estimation of available phosphoric acid in (VEITCH), A., ii, 166.
 estimation of phosphoric acid available as plant food in (PLOT), A., ii, 510.

- Manures**, artificial, containing nitrates, estimation of nitrogen in (VEITCH), A., ii, 166.
See also *Agricultural Chemistry*.
- Marbles** (VOGT), A., ii, 734.
- Marc wines**. See *Wine*.
- Marcasite**, composition and heat of combustion of (CAVAZZI), A., ii, 598.
- Margarine** and butter, relative digestibility of, in the human intestine (LÜRRIG), A., ii, 224, 667.
nutritive value of, compared (BENTARELLI), A., ii, 224.
detection of yolk of egg in (MECKE), A., ii, 123.
detection of sucrose in (MECKE), A., ii, 319.
detection of sesamé oil in (BÖMER and WINTER), A., ii, 178; (BREMER; SOLTSIEN), A., ii, 325; (AMTHOR), A., ii, 453.
detection of, in cheese (FASCETTI and GHIGI), A., ii, 377.
- Maripa fat** (VAN DEN DRIESSEN-MAREEUW), A., ii, 773.
- Marls**, estimation of calcium carbonate in (NOLL), A., ii, 48.
See also *Agricultural Chemistry*.
- Marijatskite** from Bogoslawsk, Urala (v. FEDOROFF and NIKITIN), A., ii, 486.
- Mass law** and physical reactions (LINCOLN), A., ii, 392.
- Mastic resin**, examination of (DIETERICH), A., ii, 118.
- Meat**, preserved, isolation of glycogen from (BREUSTEDT), A., ii, 321.
estimation of boric acid in (BEYTHIEN and HEMPEL), A., ii, 313.
estimation of tin in, and the state in which it occurs (WIRTHLE), A., ii, 512.
- Meat extract**, carnosine from (v. GULEWITSCH and AMIRADŽIBI), A., i, 516.
- Meconic acid**, constitution of (PERATONER and LEONARDI), A., i, 550.
- Meconin**, thermochemistry of (LEROY), A., ii, 261.
- Meconindimethyl ketone** and its salts and methyl derivative (FULDA), A., i, 36.
- Melibiose**, crystallised (BAU), A., i, 77.
- Melilite group** of minerals (FOUQUÉ), A., ii, 551.
- Melinite** (?) from Moravia (KOVÁK), A., ii, 148.
- Melite** from Saalfeld, Thuringia (ZAMBONINI), A., ii, 150.
- Melitriose**. See *Raffinose*.
- Melonite** (?) from California (HILLEBRAND), A., ii, 22.
- Melonite** from S. Australia (HIGGIN), A., ii, 283; (DIESELDORFF), A., ii, 664.
- Melting point** and volume change (TAMMANN), A., ii, 714.
of various substances (LADENBURG and KRÜGEL), A., ii, 259.
of alkyldicarboxylic acids, and their amic acids and imides (AUWERS, MAYER, and SCHLEICHER), A., i, 85.
of homologues, regularities in the (SALZER), A., ii, 260.
relation between the boiling point and, in hydrocarbons (BAYLEY), A., i, 369.
- Melting point curves** of mixed crystals (ROOZEBOOM; REINDERS), A., ii, 70; (VAN EIJK), A., ii, 133.
of mixtures of optical isomerides (ROOZEBOOM), A., ii, 64; (ADRIANI), A., ii, 463.
- Melting point determinations**, method for (KUHARA and CHIKASHIGE), A., ii, 260.
apparatus for (HOUBEN), A., ii, 645.
apparatus for drying substances for (STREATFIELD and SOUTHERDEN), A., ii, 718.
- Membranes**, animal, influence of, on the diffusion of various substances (HEDIN), A., ii, 221.
semipermeable, electrolysis through (MORITZ), A., ii, 522.
- Memorial lectures**: Victor Meyer (THORPE), T., 169; P., 1900, 33; Bunsen (ROSCOR), T., 513; P. 1900, 84; Friedel (CRAFTS), T., 993; Nilsson (PETTERSSON), T., 1277.
- Mentha piperita**, oil of (CHARABOT), A., i, 303.
- Menthane**, nitration of (KONOWALOFF and JEBENKO), A., i, 324.
- Menthanementhylhydrazone** (KIJNER), A., i, 278.
- Menthazine** (KIJNER), A., i, 279.
- Menthene** from menthol (KONOWALOFF), A., i, 352.
synthesis of (TSCHUGAEFF), A., i, 129.
genesis of, in *Mentha piperita* (CHARABOT), A., i, 303.
- Menthol**, action of dry silver oxide and ethyl iodide on (LANDER), T., 731; P., 1900, 6.
- Menthol series**, isomerism in the (KONDAKOFF and LUTSCHININ), A., i, 104, 604.
- Menthomenthol**, preparation of (KONDAKOFF and LUTSCHININ), A., i, 104.
- Menthone**, genesis of, in *Mentha piperita* (CHARABOT), A., i, 303.
transformation of rhodinal into (BOUVEAULT), A., i, 452.
oxidation of (MARKOWNIKOFF), A., i, 476.

Menthonisooxime and its hydrolysis (WALLACH), A., i, 590.

Menthonesemicarbazone (RIMINI), A., i, 555.

Menthylamines, bromo-, action of silver oxide on (KIJNER), A., i, 278.

l-Menthylhydrazones and its compound with phenylthiocarbimide (KIJNER), A., i, 278.

Mercaptans (*thiols*), aromatic, preparation of (BOURGEOIS), A., i, 163.

Mercaptans. See also :—

Ethyl mercaptan.

2:6-Lutidyl 4-mercaptan.

Methylnaphthiazolyl mercaptan.

Methylpyrimidinethiols.

Naphthatriazolyl mercaptan.

β -Naphthyl mercaptan.

Phenyl mercaptan.

Pyridyl mercaptan.

Tolyl mercaptans.

Xylylene hydrosulphides.

Xylylenemethylenemercaptals.

Mercaptoles (POSNER and FAHRENHORST), A., i, 16.

of ketonic acids (POSNER), A., i, 5;
(POSNER and FAHRENHORST), A., i, 16.

Mercarbide and its salts (HOFMANN), A., i, 383.

Mercury, purification and vapour tension of (HULETT), A., ii, 543.

vapour density of (BAKER), T., 648;
P., 1900, 68.

compressibility of (HULETT), A., ii, 397.

solubility of metals in (LARSEN), A., ii, 255.

action of, on methylene iodide (THOMAS), A., i, 213.

Mercury alloys (*amalgams*) (KURNAKOFF), A., ii, 277; (GUNTZ and FÉRÉE), A., ii, 540; (KERP and BÖTTGER), A., ii, 656.

dilute, influence of temperature on the electrical conductivity of (LARSEN), A., ii, 255.

distillation of (HULETT), A., ii, 543.

with aluminium, action of, on alcohols (TISTSCHENKO), A., i, 269.

with cadmium, with lithium, with rubidium, and with strontium (KERP and BÖTTGER), A., ii, 656.

with potassium and sodium (KURNAKOFF), A., ii, 277; (GUNTZ and FÉRÉE), A., ii, 540; (KERP and BÖTTGER), A., ii, 656.

Mercurammonium compounds, formulae of (HOFMANN and MARBURG), A., ii, 279.

Diammoniomercuric iodide, action of ammonia on (FRANÇOIS), A., ii, 208, 346.

Mercurammonium compounds:—

Mercuriammonium iodide, formation of (FRANÇOIS), A., ii, 346.

Dimercuriammonium iodide, anhydrous, amorphous and crystalline (FRANÇOIS), A., ii, 280.

Mercury compounds, isomorphous, with gold (BEHRENS), A., ii, 213.

Mercury salts, action of sodium thiosulphate on (FAKTOR), A., ii, 627; (NORTON), A., ii, 689.

Mercury antimonide (PARTHEIL and MANNHEIM), A., i, 479.

iodides, direct formation of crystallised (BODROUX), A., ii, 543.

ammonium and potassium iodides, dissociation of (FRANÇOIS), A., ii, 142.

phosphide and the action of methyl and ethyl iodide on (PARTHEIL), A., ii, 543.

selenide, action of hydrogen on, and the inverse action (PÉLABON), A., ii, 346.

chlorosulphide (BODROUX), A., ii, 481.

Mercuric bromide and iodide, mixed crystals of (REINDERS), A., ii, 70.

chloride (*corrosive sublimate*), action of, on hydrogen phosphide (PARTHEIL), A., ii, 543.

effect of oxidising agents on the reduction of, by oxalic acid (KASTLE and BRATTY), A., ii, 627.

estimation of, volumetrically (RUPP), A., ii, 628.

estimation of, in dressings (LEHMANN), A., ii, 443, 511; (UTZ), A., ii, 762.

iodide, transformation temperature of (GERNEZ), A., ii, 141.

effect of solvents on the allotropic change of (KASTLE and CLARK), A., ii, 141.

action of, on alkyl sulphides (SMILES), T., 163; P., 1899, 240.

action of ammonia on (FRANÇOIS), A., ii, 208.

oxide, red and yellow, isomerism of (COHEN), A., ii, 184, 381; (ORTWALD), A., ii, 712.

action of iodine on (ORTON and BLACKMAN), T., 835; P., 1900, 104.

Mercurous chloride, vapour density of dried (BAKER), T., 646; P., 1900, 68.

iodide (RAY), P., 1899, 239.

nitrite, action of, on ethyl iodide (RAY), P., 1899, 239.

sulphate, action of water on (GOUY), A., ii, 481.

Mercury organic compounds:—

Mercury salts, action of allyl alcohol on (SAND and HOFMANN), A., i, 386; (BIILMANN), A., i, 431; (HOFMANN and SAND), A., i, 618.

action of ethylene on (HOFMANN and SAND), A., i, 384, 618; (BIILMANN), A., i, 431.

action of propylene and butylene on (SAND and HOFMANN), A., i, 385.

of ketonic acids, and their conversion into mercurioketonic acids (LEY), A., i, 382.

Mercury halogen derivatives, compounds of, with antipyrine (VILLE and ASTRE), A., i, 362, 411.

compounds of, with iodoantipyrine, (BOUGAULT), A., i, 361.

sulphate, compound of, with acetone-dicarboxylic acid (DENIGES), A., i, 39.

Mercuriacetic acid, bromo- and iodo- (HOFMANN and SAND), A., i, 385.

Trimercuriacetic acid (HOFMANN), A., i, 383.

Mercuribenzoic acid, chloro-, bromo-, and iodo-, and their salts (PESCI), A., i, 546.

Mercurilævulic acids (LEY), A., i, 382.

Mercurisalicilic acid (LINTNER), A., ii, 631.

Mercuric cyanide and cyanate, estimation of (VINCENT), A., ii, 174.

Mercury-dimethyl, -diethyl, and -diphenyl, heat of combustion and of formation of (BERTHELOT), A., ii, 129.

Mercurydimethyl, action of nitric peroxide on (BAMBERGER and MÜLLER), A., i, 145.

p-**Mercuriodiphenylenetetraethylmercuridiammonium acetate**, physiological action of (BENEDICENTI and POLLEDRO), A., ii, 359.

"**Meruroheptanaphthene iodide**" (KURSANOFF), A., i, 89.

Mercury, detection and estimation of:— delicate test for (CAZENEUVE), A., i, 465.

detection of, in urine (HOEHNEL), A., ii, 368; (JOLLEN), A., ii, 576.

estimation of, in urine (SCHUMACHER and JUNG), A., ii, 247; (JOLLEN), A., ii, 576; (FARUP; WERDER), A., ii, 689.

clinical estimation of, in urine (ESCHBAUM), A., ii, 368.

estimation and separation of, as mercurous oxalate (PETERS), A., ii, 576.

β-**isoMeroquinenine** (*β*-*isomerochinene*) and its aurichloride (SKRAUP), A., i, 605.

Mesenteric cyst, composition of the liquid contained in a (RICHAUD and BONNEAU), A., ii, 557.

Mesidine, bromo- [$\text{Me}_2\text{NH}_2\text{Br} = 1:3:5:2:4$] (FISCHER and WINDAUS), A., i, 434.

Mesitol, *di*- and *tri*-bromo-, oxidation products of (AUWERS), A., i, 161; (AUWERS, BROICHER, and WOLFF), A., i, 162.

phenylurethanes of (AUWERS, TRAUN, and WELDE), A., i, 166.

Mesityl bromide, action of sodium on (WEILER), A., i, 213.

Mesitylene (1:3:5-*trimethylbenzene*), refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237. oxidation of (WEILER), A., i, 284.

Mesitylene, bromo-, action of sodium on (WEILER), A., i, 213.

chloro-iodo-, -iodoso-, -iodoxy-, -iodoso-, and -iodoxy-, and some of their salts (WILLGERODT and RONGATZ), A., i, 432.

Mesitylenediacetate (HANTZSCH), A., i, 568.

Mesityl oxide (*methyl isobutenyl ketone*; *isopropylideneacetone*), its halogen and acetoxy and methoxy derivatives (PAULY and LIECK), A., i, 274.

action of amidines on (TRAUBE and SCHWARZ), A., i, 116.

condensation of, with ethyl sodium-methylmalonate (CROSSLEY), P., 1900, 90.

α-**Mesityloxime**, oxidation of (HARRIES), A., i, 504.

Mesoxamide, oxime of, and its salts and acetyl and ethyl derivatives, and the action of nitrous acid on (WHITELEY), T., 1040; P., 1900, 145.

Metabolism, influence of the kind and amount of nutriment on (PFLÜGER), A., ii, 91.

influence of sodium salicylate on (GOODBODY), A., ii, 670.

influence of removal of water on (STRAUB), A., ii, 91.

human, rôle of purine substances in (BURIAN and SCHÜR), A., ii, 489.

during poisoning with pulegone (LINDEMANN), A., ii, 223.

nitrogenous, after splenectomy (MENDEL and JACKSON), A., ii, 288.

proteid (ALBU), A., ii, 151.

during gelatin feeding (KIRCHMANN), A., ii, 669.

influence of sodium chloride injected subcutaneously on (KRUMMACHER), A., ii, 670.

Metabolism, proteid, in plants (SCHULZE), A., ii, 745.
 in pernicious anæmia (v. MORACZEWSKI), A., ii, 295.
 in leucæmia (v. STEJSKAL and ERBEN), A., ii, 423.
 in children (CAMERER and SÖLDNER), A., ii, 222.
 mineral, in naturally and artificially fed infants (BLAUBERG), A., ii, 669.
 in a vegetarian (RUMPF and SCHUMM), A., ii, 222.
 in full-grown bullocks with maintenance and fattening foods (KELLNER and KÖHLER), A., ii, 563, 565, 566.
 nitrogenous, in the cat (MENDEL and BROWN), A., ii, 151.
 in frogs (v. MORACZEWSKI), A., ii, 31.
 in horses (PFEIFFER), A., ii, 554.
 in Ruminants (HAGEMANN), A., ii, 222.
 proteid, in Ruminants, influence of ammonia and asparagine on (KELLNER, KÖHLER, BARNSTEIN, ZIELSTORFF, EWERT, and WEDEMEYER), A., ii, 417.
 of arsenic (GAUTIER), A., ii, 670.
 with edestin, and with calcium and magnesium (LEIPZIGER), A., ii, 223.
 of iodine (GAUTIER; BOURCET), A., ii, 670.
 of nuclein (LOEWI), A., ii, 417.
 of nucleins (MILROY and MALCOLM), A., ii, 91.
 of phosphorus (NOËL-PATON, DUNLOP, and AITCHISON), A., ii, 222; (LEIPZIGER), A., ii, 223.
 gaseous, of the submaxillary gland (BARCROFT), A., ii, 417.
Metal-ammonia compounds, nature of, in aqueous solution (DAWSON and McCRAE), T., 1239; P., 1900, 172.
Metallic chlorides, decomposition of (OECHSNER DE CONINCK), A., ii, 485, 543.
 compounds, fluorescence of, under the influence of Röntgen and Becquerel rays (BARY), A., ii, 330.
 crystallisation by electric currents (TOMMASINA), A., ii, 185; (TOMMASI), A., ii, 339.
 hydroxides, energy of some, deduced from the hydrolysis of their salts (CARRARA and VESPIGNANI), A., ii, 647.
 salts, effect of concentration on the magnetic rotation of (FORCHHEIMER), A., ii, 524.
 action of alkali hydroxides and bromine on (VITALI), A., ii, 208.
 solutions, colloidal. See Colloidal.

Metals, indices of refraction of (VAN AUBEL), A., ii, 125.
 influence of light on the electrical properties of (BUISSON), A., ii, 519.
 passivity of (HITTOFF), A., ii, 705.
 specific heat of (TILDEN), A., ii, 524.
 specific heat of, at low temperatures (BEHN), A., ii, 259.
 reciprocal displacement of (COLSON), A., ii, 140.
 catalytic action of some (ŠULC), A., ii, 395.
 solubility of, in mercury (LARSEN), A., ii, 255.
 electrolytically deposited, reducing action of (BINZ and HAGENBACH), A., ii, 384.
 action of very dilute nitric acid on (VAN BIJLERT), A., ii, 204.
 influence of, on broth cultures of Bacteria (ISACHENKO), A., ii, 230.
 combination of, with nucleins (STASSANO), A., ii, 559.
 heavy, fused halogen compounds of, change of free energy and ionic concentrations in (LORENZ), A., ii, 61.
 noble, alloys of the, estimation of iridium in (MIETZSCHKE), A., ii, 371.
 behaviour of rhodium in (RÜSSLER), A., ii, 732.
 application of the Kjeldahl method of destroying organic substances in the detection of (GRAS and GINTL), A., ii, 111.
 diphenylcarbazine as a reagent for (CAZENEUVE), A., ii, 627.
 detection of, by the absorption spectra of their compounds with alkanna (FORMÁNEK), A., ii, 687.
 estimation of arsenic in (HOLLARD and BERTIAUX), A., ii, 438.
Metapurpuric acid. See under Purpuric acid.
Meteoric irons (COHEN), A., ii, 664.
 from Bethany, Great Namaqualand (COHEN), A., ii, 736.
 from Griqualand East, South Africa (COHEN), A., ii, 736.
 from Iredell, Texas (FOOTE), A., ii, 150.
 from Morradal, Norway (COHEN), A., ii, 488.
 from Patagonia (FLETCHER), A., ii, 27.
 from Quesá, Spain (BOSCÁ Y CASANOVES; COHEN), A., ii, 415.
 from Youndegin, Western Australia (FLETCHER), A., ii, 27.
Meteorite, new, from Allegan, Michigan, and from Mart, Texas (MERRILL and STOKES), A., ii, 737.

- Meteorite** from Ergheo, Somaliland (ARTINI and MELZI), A., ii, 488.
 from Illinois Gulch, Montana (PRESTON), A., ii, 287.
 from Jamysheff and Tubil river, Siberia (ANTIPOFF), A., ii, 220.
 from Oakley, Kansas (PRESTON), A., ii, 552.
- Meteorites**, two new American (PRESTON), A., ii, 355.
- Methæmoglobin**. See under Hæmoglobin.
- Methane** and mixtures of methane and hydrogen and air, limits of combustibility of, passed over red-hot cupric oxide (GAUTIER), A., ii, 469.
 tri- and tetra-halogen substituted, action of alcoholic potash, sodium ethoxide, or potassium cyanide and metals on (NER), A., i, 2.
 bromine derivatives of (POURET), A., i, 369.
tetrachloro-. See Carbon *tetrachloride*.
 nitro-, action of alkalis and ammonia on (DUNSTAN and GOULDING), T., 1262; P., 1900, 174.
 isonitro-, action of diazobenzene on (BAMBERGER, SCHMIDT, and LEVINSTEIN), A., i, 566.
- Methazonic acid**, preparation, constitution and reactions of (DUNSTAN and GOULDING), T., 1264; P., 1890, 174.
- Methenyl compounds**, mixed (EHRERA), A., i, 38.
- Methoethene-5-hexene-2-acid-6**. See α -*iso*Propylidene- γ -hexenoic acid.
- Methoethiol-5-hexene-2-acid-6**. See α -Hydroxyisopropyl- γ -hexenoic acid.
- 2-Methothio-1-phenyl-4:4:6-trimethyl- and 2-Methothio-4:4:6-trimethyl-1-allyl-dihydropyrimidine** (TRAUBE and LORENZ), A., i, 116.
- Methoxide**, sodium, action of, on the dibromides of propenyl compounds and of unsaturated ketones (POND, MAXWELL, and NORMAN), A., i, 102.
- 2-Methoxyacetylacetophenone** (BLOCH and v. KOSTANECKI), A., i, 502.
- p*-Methoxybenzonitrile** (HENRY), A., i, 172.
- o*-Methoxybenzyl alcohol** and methyl and ethyl ethers (PSCHORR, WOLFES, and BUCKOW), A., i, 232.
- β -Methoxy- β -benzylacrylic acid**, α -cyano-, methyl ester (HALLER and BLANC), A., i, 496.
- p*-Methoxybenzylidenebis-2-methyl-indole** (v. WALTHER and CLEMEN), A., i, 408.
- Methoxybenzylidene-*d*- and -*l*-camphors**, *o*- and *p*- (HALLER), A., i, 301.
- p*-Methoxybenzylidene-2-naphthylamine**, 1-bromo- and 1-chloro-, and their hydrocyanides (MORGAN), T., 1216; P., 1900, 171.
- 4-Methoxydibromocanthraquinone** (PSCHORR and JAECKEL), A., i, 489.
- p*-Methoxycinnamic acid**, ethyl ester, from the oil of *Kaempferia Galanga* (VAN ROMBURGH), A., i, 677.
- Methoxycoumarones**, 4- and 5- (STOERMER), A., i, 655.
- 3'-Methoxy-2:4'-diethoxy-flavanone and -flavone** (v. KOSTANECKI and SCHMIDT), A., i, 238.
- o*-Methoxydiphenylcarbamide** (RANSOM), A., i, 219.
- 4'-Methoxy-6-ethoxyflavanoneoxime** (v. KOSTANECKI), A., i, 449.
- Methoxyethylideneoxanilide** (v. PECHMANN and ANSEL), A., i, 389.
- 6-Methoxy-glauconic and -hydroglauconic acids** (DOEBNER), A., i, 313.
- p*-Methoxyhydratropic acid**, synthesis of (BOUGAULT), A., 495, 548.
- 5-Methoxyhydrindene** (MOSCHNER), A., i, 344.
- Methoxymesityl oxide** (PAULY and LIECK), A., i, 275.
- 5-Methoxy-7-methyl-1:3-diketohydrindene-4-mono- and -2:4-dicarboxylic acids**, methyl esters (LANDAU), A., i, 661.
- Methoxy-3-methylisoquinolines**, 4- and 1-, 1- and 4-chloro- (GABRIEL and COLMAN), A., i, 359.
- Methoxynaphthalic anhydride** (ANSELM and ZUCKMAYER), A., i, 176.
- 3-Methoxyphenanthraquinone** (PSCHORR, WOLFES, and BUCKOW), A., i, 233.
- 4-Methoxyphenanthraquinone, dibromo-** (PSCHORR and JAECKEL), A., i, 489.
- Methoxyphenanthrenes**, 1- and 3-, synthesis of, and their 10-carboxylic acids (PSCHORR, WOLFES, and BUCKOW), A., i, 232.
- 4-Methoxyphenanthrene and its dibromoderivative and 2-carboxylic acid** (PSCHORR and JAECKEL), A., i, 488.
- β -*o*-Methoxyphenoxycinnamic acid** and its ethyl ester (RUHEMANN and STAPLETON), T., 1180; P., 1900, 168.
- o*-Methoxyphenoxystyrene** (RUHEMANN and STAPLETON), T., 1181; P., 1900, 168.
- o*-Methoxyphenylacetic acid** (PSCHORR, WOLFES, and BUCKOW), A., i, 232; (LEBEDEFF), A., i, 490.
- β -Methoxy- β -phenylacrylic acid** α -cyano-, ethyl ester (HALLER and BLANC), A., i, 496.
- p*-Methoxyphenylcarbamie acid**, ethyl ester and *p*-Methoxyphenylcarbimide (VITTENET), A., i, 154.

- o*-Methoxyphenylcarbamide** (RANSOM), A., i, 219.
- 3-*p*-Methoxyphenyl-2-carbostyryl** (PSCHORR and WOLFFES), A., i, 170.
- o*-Methoxyphenyl-di- and -tri-chloromethylcarbinols** and their acetyl derivatives (LEBEDEFF), A., i, 490.
- α -*o*-Methoxyphenyl- β -*o*-nitroacetyl-vanillylacrylic acid**, synthesis with (PSCHORR), A., i, 233.
- α -*o*- and -*p*-Methoxyphenyl-*o*-nitrocinamic acids**, syntheses from (PSCHORR, WOLFFES, and BUCKOW), A., i, 232.
- 3-*p*-Methoxyphenylquinoline, 2-amino-** (PSCHORR and WOLFFES), A., i, 170.
- o*-Methoxyphenylurethane** (RANSOM), A., i, 219.
- 4-Methoxyisoquinoline, 1-chloro-** (GABRIEL and COLMAN), A., i, 358.
- p*-Methoxystilbene**, and its chloro-, bromo-, and nitro-derivatives (v. WALTHER and WETZLICH), A., i, 438.
- o*-Methoxystyrene, - β -dichloro-** (LEBEDEFF), A., i, 490.
- Methyl alcohol**, boiling point of, with mixtures of benzene, carbon tetrachloride, ether, and ethyl alcohol (HAYWOOD), A., ii, 64.
- detection of (JANDRIER), A., ii, 52.
- detection of, in alcohols (WOLFF), A., ii, 111.
- Methylacetalyl-quinol, and -resorcinol** (STOERMER), A., i, 655.
- Methylacetyl-*p*-acetaminobenzoic acid** (TROEGER), A., i, 227.
- Methylacetylcarbinol** (HENRY), A., i, 538.
- Methylacetylmalononitrile** (HENRY), A., i, 538.
- Methylacrylic acids, α - and β -**, ethyl esters, condensation of, with ethyl sodiocyanoacetate (HOWLES, THORPE, UDALL, and NEALE), T., 947; P., 1900, 115.
- Methyladipic acids, α - and β -** (MARKOWNIKOFF), A., i, 475.
- Methylal**, heat of combustion and of formation of (BERTHELOT and DELÉPINE), A., ii, 334.
- Methylalisanin and its diacetyl derivative** (v. NIEMENTOWSKI), A., i, 450.
- Methylallantoins, α - and β -**, from the methyluric acids (FISCHER and ACH), A., i, 65.
- Methylallylaniline**, and the action of cyanogen bromide on (v. BRAUN), A., i, 642.
- Methylamine**, spectrum of (HARTLEY and DOBBIE), T., 320; P., 1900, 14.
- action of iodine chloride on (ORTON and BLACKMAN), T., 833; P., 1900, 103.
- Methylamine**, hydrates of, heat of formation of (DE FORCRAND), A., ii, 476.
- cadmium haloids (BAGLAND), A., i, 141.
- tellurium chloride (LENHER), A., i, 379.
- tin haloids (COOK), A., i, 142.
- Methylaminocombelic acid** (HEFFTER and FEUERSTEIN), A., i, 498.
- 3-Methylaminoflavinduline salts, 2-amino-** (KEHRMANN and STOFFEL), A., i, 254.
- 7-Methylamino-4-methylcoumarin** (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- Methylaminomethyl-2-piperidone** (WILLSTÄTTER), A., i, 405.
- Methyl-*o*-aminophenol**, oxidation products of (DIEPOLDER), A., i, 191.
- Methyl amyl diketoxime**, diacetyl derivative of (PONZIO), A., i, 588.
- γ -Methyl- β -amylene and δ -Methyl- γ -amylene**. See Hexylene.
- $\alpha\alpha$ -Methylisamylsuccinic acid** and its oxidation products (LAWRENCE), P., 1900, 156.
- $\alpha\alpha$ -Methylisamylsuccinic acids, *cis*- and *trans*-**, dissociation constants of (BONE and SPRANKLING), T., 1304; P., 1900, 184.
- Methylaniliminocarbaminothioglycollic acid** (HARRIES and KLAMT), A., i, 413.
- Methylaniline**, action of formaldehyde on (GOLDSCHMIDT), A., i, 436.
- Methyl-*o*-anisidine**, oxidation products of (DIEPOLDER), A., i, 191.
- β -Methylantracone** from *p*-toluoyl-*o*-benzoic acid (LIMPRICHT and WIEGAND), A., i, 498.
- Methylantranillic acid**, methyl ester, in oil of mandarin (WALBAUM), A., i, 595.
- β -Methylantraquinone** from *p*-toluoyl-*o*-benzoic acid (LIMPRICHT and WIEGAND), A., i, 498.
- Methylation** of colouring matters (PRUD'HOMME), A., i, 244.
- and sulphonation, simultaneous, of colouring matters (PRUD'HOMME), A., i, 455.
- p*-Methylbenzaldazine**, reduction of (CURTIUS), A., i, 611.
- 1-Methylbenzoxazole 4-carboxylic acid**, ethyl ester (EINHORN), A., i, 441.
- p*-Methylbenzyl-hydrazine** and -semicarbaside and their derivatives (CURTIUS), A., i, 612.
- p*-Methylbenzylhydrazine**, nitroso- (CURTIUS), A., i, 699.
- p*-Methylbenzyl-*p*-methylbenzylidene-hydrazine** and its derivatives (CURTIUS), A., i, 611.

- 2-Methyl-2-bromopropanal.** See *iso-Butaldehyde*, α -bromo-.
- Methyl-2-butanolic acid.** See *n*-Valeric acid.
- Methyl isobutenyl ketone.** See *Mesityl oxide*.
- Methyl-*n*-butylbenzenes**, *o*-, *m*-, and *p*-(*n*-butyltoluenes) (NIEMCZYCKI), A., i, 636.
- Methyl isobutyl diketoxime**, diacetyl derivative of (PONZIO), A., i, 588.
- γ -Methyl- β -butylene.** See *Amylene*.

- Methylisobutylglutaric acids**, *cis*- and *trans*-, and their anhydrides and anilic acids (LAWRENCE), P., 1900, 154.
- β -Methyl-*tert*.butylhydracrylic acid** and its salts (TALANZEFF), A., i, 328.
- 4-Methyl-6-butyl-1:2-phthalic acid** (BAUR-THURGAU), A., i, 640.
- α -Methyl- α -isobutylpropanetricarboxylic acid**, and its ethyl ester (LAWRENCE), P., 1900, 154.
- $\alpha\alpha$ -Methylisobutylsuccinic acids**, *cis*- and *trans*-, preparation and dissociation constants of (BONE and SPRANKLING), T., 1903; P., 1900, 184.
- Methylbutyric acid.** See *Valeric acid*.
- 2-Methylcamphenepyrrole** and its 3-acyl derivatives and 3-carboxylic acids (DUDEN and TREFF), A., i, 672.
- 2-Methylcamphenepyrroline** and its 3-acetyl derivative and 3-carboxylic acid (DUDEN and TREFF), A., i, 672.
- Methylisocarbamide** (STIEGLITZ and MCKEE), A., i, 340, 431.
- Methylcarbasolenine** (PLANCHER), A., i, 562.
- 3-Methylisocarbostyryl** (GABRIEL and COLMAN), A., i, 359.
- Methylcarboxyresoroylactic acid** (GILBODY, PERKIN, and YATES), P., 1900, 106.
- Methyl- α -chloroethylketonedithyldisulphone** (POSNER and FAHRENHORST), A., i, 17.
- 2-Methylchromone** (BLOCH and v. KOSTANECKI), A., i, 502.
- 4-Methylcoumarin**, 7-amino-, and its acyl derivatives (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- 4-Methylcoumarin-7-trimethylammonium iodide** (v. PECHMANN), A., i, 173; (v. PECHMANN and SCHWARZ), A., i, 174.
- Methylcoumarones**, isomeric (STOERMER), A., i, 650.
- Methylcyanacetic acid**, ethyl ester, constitution of the sodium derivative of (THORPE), T., 923; P., 1900, 113.
- Methyleyananiline** (SCHOLL and NÜRR), A., i, 435.
- Methyleytisine** (RAUWERDA), A., i, 607, 684.
- Methyldiallylcarbinol**, pentahydric alcohol from, and its acetyl derivatives (MAXIMOVITSCH), A., i, 325.
- Methyl-*m*-diasine.** See *Methylpyrimidine*.
- Methyl-diisobutyl- and -diamylsulphines**, platinichlorides of (STRÖMHOLM), A., i, 326.
- Methyldiethylsulphine iodide** mercuric iodide (SMILEN), T., 162; P., 1899, 240.
- 6-Methyldihydroquinaldine** (DOEBNER), A., i, 313.
- Methyldilituric acid**, and its salts, and bromo- and chloro- (ANDREASCH), A., i, 479.
- Methyl-1:1-dimethylpyrrolidinium haloids** (WILLSTÄTTER), A., i, 249.
- Methyldipropylsulphines**, platinichlorides of (STRÖMHOLM), A., i, 326.
- Methylene derivatives**, condensation of, with aromatic nitroso-compounds (SACHS), A., i, 362.
- iodide**, action of mercury on (THOMAS), A., i, 218.
- sulphate** (DELÉPINE), A., i, 180.
- action of**, on benzyl alcohol (DELÉPINE), A., i, 163.
- dithiocarbonate**, bromo- (KONOW-LOFF and PLOTNIKOFF), A., i, 323.
- Methyleneasparagine** (SCHIFF), A., i, 85.
- Methylenebis-1-bromo- and -1-chloro-2-naphthylamine** (MORGAN), T., 814; P., 1900, 131.
- Methylenebisdihydroresorcinol**, **Methylenebis-mono- and -di-methyldihydroresorcinol**, and **Methylenebisphenyldihydroresorcinol** (VORLANDER and KALKOW), A., i, 99.
- Methylenebis-2-methylindole** and its nitro-derivatives (v. WALTHER and CLEMEN), A., i, 408.
- Methylenedibenzasimide** (*methylenebis-benzotriazole*) (MEYER and ROHMER), A., i, 223.
- Methylenedibenzsiminasole** and its salts (MEYER and ROHMER), A., i, 223.
- Methylenedi-2-ethyl- and -2-methylbenzsiminasole**, and their salts (MEYER and ROHMER), A., i, 223.
- 4-*mp*-Methylenedioxybenzylidenebis-1-phenyl-3-methyl-5-pyrazolone** (TANBOR and LICHSKI), A., i, 364.
- Methyleneglutamine** (SCHIFF), A., i, 86.
- Methyleneglucose** and its osazone (TOLLENS), A., i, 15.
- Methylene-group**, method of entering the molecule of a polyhydric acid or alcohol (TOLLENS), A., i, 205.

- Methylenehomosparagine** (SCHIFF), A., i, 86.
- m*- and *p*-**Methylenemalononic acids**, ethyl esters, preparation and distillation of (BOTTOMLEY and PERKIN), T., 306; P., 1900, 16.
- Methylenemalononic** and *p*-**Methylenemalononic acids**, ethyl esters, hydrolysis of (BOTTOMLEY and PERKIN), T., 306; P., 1900, 16.
- Methylene-*d*- and -*l*-mannonic lactones** (CLOWES and TOLLENS), A., i, 205.
- Methylenepapaverine** and its salts (KÖRNIGS), A., i, 190.
- Methylenetetraphenyldiquinoxaline** (MEYER and ROHMER), A., i, 224.
- Methyl ethyl sulphide-mercuric iodide** (SMILES), T., 164; P., 1899, 240.
- Methylethylacetyl sulphine** platinichloride (STRÖMHOLM), A., i, 326.
- Methylethylacetoxime**, chloro- (PATIEFF), A., i, 14.
- β -Methylethylacrylic acid**. See Hexenoic acid.
- Methylethylacetyl sulphine** bromide and picrate (SMILES), T., 1175; P., 1900, 168.
- Methyl ethyl diketoxime**, diacetyl derivative of (PONZIO), A., i, 588.
- β -Methylethylhydracrylic acid** and its salts (POKROVSKY), A., i, 328.
- Methyl ethyl ketone** and its acetyl, chloro-, and bromo-derivatives (HENRY), A., i, 537.
- mutual solubility of water and, in presence of alcohol (BRUNI), A., ii, 196.
- d*- and *l*-**Methylethylphenacetyl sulphine** *d*-bromocamphorsulphonates and picrates (SMILES), T., 1175; P., 1900, 168.
- i*-**Methylethylphenacetyl sulphine** bromide and picrate (SMILES), T., 1175; P., 1900, 168.
- Methylethylphenonaphthacridium** bromide, amino- ("aminomethylethyl-naphthacridium bromide"), and its acetyl derivative (ULLMANN and NAEF), A., i, 689.
- Methylethyl- α - and - β -propionethetines** salts (VANZETTI), A., i, 327.
- d*-**Methylethyl-*n*-propyl tin iodide** (POPE and PEACHEY), P., 1900, 42.
- d*-bromocamphorsulphonate (POPE and PEACHEY), P., 1900, 116.
- Methylethyl-propyl-, -butyl-, -amyl-, -hexyl-, and -octyl-sulphines** and their salts (STRÖMHOLM), A., i, 325.
- Methylethylthetine**, attempts to resolve (SMILES), T., 168; P., 1899, 240.
- resolution of, into active components (POPE and PEACHEY), T., 1072; P., 1900, 12.
- Methylethylthetine tartrate**, attempts to resolve (STRÖMHOLM), A., i, 328.
- d*-**Methylethylthetine** platinichloride, *d*-camphorsulphonate, and *d*-bromocamphorsulphonate (POPE and PEACHEY), T., 1072; P., 1900, 12.
- 4-Methyl-4-ethyltrimethylenedicarbonimide**, 3:5-dicyano- (dicyanohomocarbonimide), (GUARESCHI and GRANDE), A., i, 111.
- iso***Methyleugenol**, acid, $C_{14}H_{14}O_4$ from the oxidation of (BOUGAULT), A., i, 495.
- Methylfurfuraldehyde**, spectrum of (ANDRLEK), A., i, 110; (WIDTSOE and TOLLENS), A., i, 244.
- 1-Methylfurfuraldehyde-*p*-nitrophenylhydrazones** (FEIST), A., i, 569.
- Methyl furfuryl ketone** and its oxime (SANDELIN), A., i, 305.
- 6-Methyl-glauconic and -hydroglauconic acids** (DOEBNER), A., i, 313.
- Methylglutaric acids**, α - and β - (*butanedicarboxylic acids*) (HOWLES, THORPE, and UDALL), T., 947; P., 1900, 116.
- Methylglyoxal-*p*-ethoxyphenylhydrazoxime**, -osazones, and -osotetrazones (AUDEN), P., 1899, 230.
- Methylglyoxal-methylphenylphenyl-osazones** and -salicylic acid osazones (AUDEN), P., 1899, 231.
- β -Methyl- α -heptadienolic acid** (v. BRAUN and STECHELE), A., i, 429.
- Methyl-2-heptene-4-one-6**, and its mono- and di-semicarbazones (TIEMANN), A., i, 275.
- Methylcycloheptenoneoxime**, reactions of and bases from (WALLACH), A., i, 45.
- Methylcyclohexamethylene ketone** from pulegone (KONOWALOFF), A., i, 352.
- Methylcyclohexane** (*heptanaphthene*, *methyl-naphthene*, *hexahydrotoluene*), (KURSANOFF), A., i, 19.
- derivatives of (MARKOWNIKOFF and TSCHERDINTZEFF), A., i, 578; (MARKOWNIKOFF), A., i, 579.
- 3-bromoamino-, action of silver oxide on (KIJNER), A., i, 278.
- 3:3-dichloro- (KLAGES), A., i, 44.
- β -Methylhexane- γ -el- ϵ -one**. See *iso*-Butyralacetone.
- 1:1-Methylcyclohexanol** (*tert.heptanaphthenol*) and its chloride (MARKOWNIKOFF and TSCHERDINTZEFF), A., i, 578.
- 1:3-Methylcyclohexanol** and its halogen derivatives (MARKOWNIKOFF), A., i, 579.
- and its bromide, physical constants of (KONDAKOFF and SCHINDELMEISER), A., i, 508.

- 1-Methyl-3-cyclohexanone** (KLAGES) A., i, 44; (WALLACH), A., i, 179.
physical constants of, and reduction of (KONDAKOFF and SCHINDELMEISER), A., i, 508.
oxidation of (MARKOWNIKOFF), A., i, 475.
- Methylcyclohexanoneoxime**, action of phosphoric oxide on (WALLACH), A., i, 45.
- Methylcyclohexanoneisoximes** and their separation and hydrolysis (WALLACH), A., 45, 590.
- 1-Methyl- $\Delta^{1,2}$ -cyclohexene** (α -*naphthylene*) (MARKOWNIKOFF and TSCHERDINTZEFF), A., i, 578.
- 1-Methyl- $\Delta^{1,3}$ -cyclohexene** (β -*naphthylene*) (MARKOWNIKOFF), A., i, 579.
- 1:3-Methylcyclo-hexenone** and -hexylhydrazine and its compound with phenylthiocarbimide (KIJNER), A., i, 278.
- 4-Methyl-4-hexyltrimethylenedicarbonimide**, 3:5-dicyano- (GUARESCHI and GRANDE), A., i, 112.
- 2-Methyl-3-hydroxyethylcamphane-pyrrolidine** and its isomeride (DUDEN and TREFF), A., i, 672.
- 2-Methyl-6:7-hyptazarin** and its diacetyl derivative (v. NIEMENTOWSKI), A., i, 450.
- 1-Methylindene** (MARCKWALD), A., i, 434.
- 2-Methylindole** (*methylketole*), condensation of, with aldehydes, ethyl acetate, and with phenylcarbimide, and the action of nitric acid on (v. WALTHER and CLEMEN), A., i, 408.
- 2-Methylindolephenyl-carbamide** and -thiocarbamide (v. WALTHER and CLEMEN), A., i, 408.
- Methylisuretine** (BIDDLE), A., i, 137.
- Methyljapaeonitine** and its aurichloride (DUNSTAN and READ), T., 54; P., 1899, 207.
- 2-Methyl-4-ketodihydroquinazoline**, synthesis of (BOGERT and GOTTHELF), A., i, 412, 608.
- 1-Methyl-2-ketohexamethylenecarboxylic acid**, ethyl ester (DIECKMANN), A., i, 624.
- Methylketole**. See 2-Methylindole.
- Methylketopentamethylenecarboxylic acid**. See Methylcyclopentanone-carboxylic acid.
- Methylmalonic acid** (*isosuccinic acid*; *ethanedicarboxylic acid*), sodium derivative of the ethyl ester, condensation of, with mesityl oxide (CROSSLEY), P., 1900, 90.
- Methylmorphimethine**, decomposition product of (PARTHEIL and GRONOVER), A., i, 516.
- isoMethylmorphol**. See 3-Hydroxy-4-methoxyphenanthrene.
- α - and β -**Methylnaphthalenes** from naphtha tar (LJUBAVIN), A., i, 23.
- Methylnaphthetetrasele** (MARCKWALD and CHAIN), A., i, 521.
- Methylnaphthatriasolyl mercaptan** (MARCKWALD and CHAIN), A., i, 521.
- Methylnaphthene**. See Methylcyclohexane.
- 2-Methyl- α -naphthiminazole**, amino-, and its sulphonic acid and diazo-compound, and hydroxysulphonic acid (GALLINER), A., i, 697.
- Methylnitramine**, physiological action of, in relation to its constitution (SPRUYT), A., i, 142.
- Methylectadienonol**, its acetate and isomeride (LÉSER), A., i, 129.
- α -Methylolbenzoic hydrazide** and its benzylidene derivative (WEDEL), A., i, 363.
- Methyloldeoxy-cinchonine** and -conchinine and their platinichlorides (KOENIGS), A., i, 190.
- Methylol-5-methyl-and-5-ethyl-acridine** (KOENIGS), A., i, 190.
- Methyloxaluric acid** (BEHREND and DIETRICH), A., i, 120.
- 1-Methylcyclopentanone**, its oxime, semicarbazone, and benzoyl derivative (BOUVEAULT), A., i, 171.
- 1-Methyl-2-cyclopentanone-1-carboxylic acid**, ethyl ester (BOUVEAULT), A., i, 171.
- 4-Methyl-3-cyclopentanone-1-carboxylic acid**, ethyl ester, and nitroso-compounds from (DIECKMANN and GROENEVELD), A., i, 297.
- Methylcyclopentanoneoxime**, action of phosphoric oxide on (WALLACH), A., i, 45.
- β -Methylcyclopentanoneisoxime** and its hydrolysis (WALLACH), A., i, 589.
- Methylpentosans**, spectrum of (WIDTSOR and TOLLENS), A., i, 244.
- Methylpentose**, isolation of, from urine (BERGELL and BLUMENTHAL), A., ii, 373.
- Methylpentoses** (SULEIMAN BEY), A., i, 377.
- Methylphenomorpholine**, colour test for (KOBERT), A., ii, 121.
- Methylphenomorpholone** (BISCHOFF), A., i, 345, 442.
- Methylphenonaphthaeridine** ("*methylnaphthaeridine*"), and its dihydro-compound and their amino-derivatives and salts, syntheses of (ULLMANN and NAEF), A., i, 360, 361, 689.
- 5-Methylphenoxazine-2:3-quinone** and its oxime (DIEPOLDER), A., i, 191.

- 2-Methyl-1:3:4:5-phenetrol**, derivatives of (KONYA), A., i, 545.
- m-Methylphenylethylamine** and its benzoyl derivative (SOMMER), A., i, 388.
- 2-m-Methylphenylethyldihydroisocindole** (SOMMER), A., i, 389.
- Methylphloroglucinol**, action of nitrous acid on, and its oximes (WEIDEL and POLLAK), A., i, 291.
- amino-derivatives of** (FRIEDL), A., i, 593.
- dibromo-**, and its triacetyl derivatives (HERZIG, POLLAK, and ROHM), A., i, 595.
- Methylpiperamide** and nitroso-, and their additive products (BAMBERGER and MÜLLER), A., i, 217.
- Methylisopilocarpine** and its salts (JOWETT), T., 853; P., 1900, 125.
- Methylpiperazine**, preparation of (ESCH and MARCKWALD), A., i, 336.
- Methylpiperidine**, action of cyanogen bromide on (V. BRAUN), A., i, 887.
- 1-Methylpiperidine**, abnormal aurichloride of (FENNER and TAFEL), A., i, 111.
- Methylisopropylaniline**, and the action of cyanogen bromide on (V. BRAUN), A., i, 642.
- 1:4-Methylisopropylbenzene**. See Cymene.
- Methylisopropylbutylsulphines**, platini-chlorides of (STRÖMHOLM), A., i, 326.
- α -Methyl-p-isopropylcinnamic acid** (GRIGOROWITSCH), A., i, 598.
- Methylisopropylcoumarones**, 3:6- and 6:3- (STOERMER), A., i, 653.
- Methyl propyl diketoxime**, diacetyl derivative of (PONZIO), A., i, 588.
- α -Methyl- β -isopropylglutaric acids** (*heptanedicarboxylic acids*) (HOWLES, THORPE, and UDALL), T., 946; P., 1900, 115.
- $\beta\beta$ -Methyl-n- and -iso-propylglutarimides**. See 2:6-Dioxy-4-methyl-4-n- and -iso-propylpiperidines.
- 3-Methyl-2-isopropylindole**, action of methyl iodide on (PLANCHER), A., i, 561.
- Methyl propyl ketone**, action of isoamyl nitrite and alcoholic hydrogen chloride on (KISSEL), A., i, 621.
- Methylisopropylquinoxaline** (PAULY and LIECK), A., i, 275.
- $\alpha\alpha$ -1-Methylpropylsuccinic acids**, *cis*- and *trans*-, preparation and dissociation constants of (BONE and SPRANKLING), T., 1302; P., 1900, 184.
- 4-Methyl-4-n- and -iso-propyltrimethylenedicarbonimides**, 3:5-dicyano- (MINOZZI), A., i, 407.
- 1-Methyl-1-propyltrimethylenedicarboxylic acid**, 2:3-dicyano- (MINOZZI), A., i, 407.

Muschketowite.
Narsarsukite.
Nasonite.
Schizolite.
Spodiophyllite.
Stokesite.
Sulvanite.
Tainiolite.
Von-Diestite.

Mineral analysis, new methods of (CARNOT), A., ii, 572.
interpretation of (PENFIELD), A., ii, 602.

substitutes for hydrochloric acid in testing for carbonates in (RICHARDS and POWELL), A., ii, 440.

Mineral oils. See Petroleum.

Mineral waters. See Water.

Minium. See Triplumbic tetroxide under Lead.

Mixtures, refraction of (PERKIN), T., 280; P., 1899, 237.

thermal conductivities of, and of their constituents (LEES), A., ii, 333.

Modulus law (PONSOT), A., ii, 392.

Molasses. See Agricultural Chemistry.

Molecular mass of sulphuric acid (LINEBARGER), A., ii, 273.

Molecular susceptibility of the paramagnetic salts of the iron group (DU BOIS and LIEBKNECHT), A., ii, 128; (LIEBKNECHT and WILLS), A., ii, 187.

of salts of the rare earths (MEYER), A., ii, 7, 186; (DU BOIS and LIEBKNECHT), A., ii, 127, 333.

Molecular volume. See Volume.

Molecular weights. See Weights.

Molluscs, acéphalous, the crystalline stalk of (COUPIN), A., ii, 420.

Molybdenum in plants (DEMARÇAY), A., ii, 235.

preparation of (ROGERS and MITCHELL), A., ii, 597.

preparation of, by the aid of liquid air (STAVENHAGEN), A., ii, 80.

Molybdenum alloys, analysis of (BORNTRÄGER), A., ii, 444.

Molybdenum dioxide (GUICHARD), A., ii, 80.

Molybdenum, blue oxide of (ROGERS and MITCHELL), A., ii, 597; (GUICHARD), A., ii, 658.

silicide (VIGOUROUX), A., ii, 144.

disulphide (GUICHARD), A., ii, 144.

sesquisulphide, Mo_2S_3 (GUICHARD), A., ii, 211.

sulphides, analysis of (GUICHARD), A., ii, 870.

Pernanganomolybdates (FRIEDHEIM and SAMELSON), A., ii, 547.

Vanadiomolybdates and Silicovanadiomolybdates (FRIEDHEIM and CASTENDYCK), A., ii, 483.

Molybdenum, estimation and separation of:—

estimation of, in iron (DÖHLER), A., ii, 691.

estimation of, in steel and steel-making alloys (IBBOTSON and BEARLEY), A., ii, 766.

separation of, from tungsten (IBBOTSON and BEARLEY), A., ii, 445.

Monkeys, effect of thyroid feeding on (EDMONDS), A., ii, 224.

Morphenol (VONGERICHTEN), A., i, 248.

Morphide, chloro-, and bromo-, and their hydrochlorides and hydrobromides (SCHRUYER and LEES), T., 1024; P., 1900, 143.

Morphine, non-nitrogenous decomposition products of (VONGERICHTEN), A., i, 248.

and its derivatives, physiological action of (WINTERNITZ), A., ii, 221, 489; (IMPENS), A., ii, 228.

derivatives, Ehrlich's diazo-reaction for the recognition of some (CACCANO), A., ii, 776.

benzyl ether (*peronine*) and ethyl ether (*dionine*), colour tests for (KOBERT), A., ii, 121.

colour test for (KOBERT), A., ii, 121.

estimation of, in organs (RUSSWURM), A., ii, 121.

isoMorphine and its hydrochloride, hydrobromide and methiodide (SCHRUYER and LEES), T., 1024; P., 1900, 143.

methiodide, action of silver sulphate and barium hydroxide on (SCHRUYER and LEES), T., 1024; P., 1900, 143.

Morphol (3:4-dihydroxyphenanthrene) (VONGERICHTEN), A., i, 248.

Mortars, change of volume of, during hydration (LE CHATELIER), A., ii, 140.

Moss-berry of Finland (STOLLE), A., ii, 614.

Mosses, chemistry of the cell membranes of (CZAPPEK), A., i, 556.

Mould, chemical action of, on butter (HANUŠ and STOCKÝ), A., ii, 772.

Moulds, replacement of potassium salts by rubidium salts in the growth of (LOEW), A., ii, 86.

influence of light on the respiration of (KOLKWITZ), A., ii, 861.

action of, on arsenic and its compounds (ABEL and BUTTENBERG), A., ii, 299.

resolution of racemic compounds by means of (ULPIANI and CONDELLI), A., ii, 493.

Mucic acid, oxidation of, in presence of ferrous salts (FENTON and JONES), T., 76; P., 1899, 224.

Mucin (LEVENE), A., i, 317.

from bone (GIES), A., i, 317.

physiological action of (LEVIN), A., ii, 295, 555.

ψ-**Mucin** from ovarian cysts (ZÄNGERLE), A., ii, 675.

Mucor Rouzii from "Chinese yeast" (WEHMER), A., ii, 743.

Müllerite from Nontron, France (ZAMBONINI), A., ii, 149.

Mulberry trees. See Agricultural Chemistry.

Muschketowite from Bogoslawsk, Urals (V. FEDOROFF and NIKITIN), A., ii, 486.

Muscle, phosphorus in (MACLEOD), A., ii, 92.

extractives of (SIEGFRIED), A., i, 127.

action of phloridzin on (LEE and HARROLD), A., ii, 558.

action of the veratrine alkaloids on (WALLER), A., ii, 425.

separation of connective tissue from (GOODMAN), A., ii, 671.

eye, effect of poisons on (GUILLERY), A., ii, 95.

heart, fat of normal and degenerated (LINDEMANN), A., ii, 32.

ventricular, action of certain ions on (LINGLE), A., ii, 739.

"surviving," action of the constant current on the respiration of (GUILLOZ), A., ii, 221.

Mustard oil from rape-cake, development and injurious effect of; and estimation of (SJOELLEMA), A., ii, 613.

Myrica Gale, constituents of (PERKIN), T., 429; P., 1900, 45.

Myricetin from various tannin matters (PERKIN), T., 423; P., 1900, 45.

Myrosin, occurrence of, in plants (BOKORNY), A., ii, 746.

N.

Naphtha, Grosny, composition of (CHARITSCHKOFF), A., ii, 147.

estimation of sulphur in (LIDOFF), A., ii, 107.

Naphtha tar, constituents of (LJURAVIN), A., i, 23.

Naphthafurans, α- and β-, bromo- and chloro-derivatives (STOERMER), A., i, 654.

β-**Naphthahydrofuran**, 1:2-dichloro- (STOERMER), A., i, 654.

1:2-**Naphtha-β-ketopentamethylene-azine** and its carboxylic and 4-sulphonic acids (THOMAS-MAMERT and WEIL), A., i, 459.

Naphthalene, vapour pressure of (ALLEN), T., 400; P., 1899, 122.

vapour in coal gas (ALLEN), A., i, 339.

derivatives, isomeric, the number of (REY), A., i, 482; (KAUFFMANN), A., i, 544.

displacement of sulphonic groups in, by nascent chlorine (VAUBEL), A., i, 544.

estimation of, in coal gas (COLMAN and SMITH), A., ii, 372.

Naphthalene, 2-chloro-, electrolytic preparation of (VOTOČEK and ZENÍSEK), A., i, 19.

1-iodoso-, and its reactions and salts (WILLGERODT and SCHLÖSSER), A., i, 282; (ORTOLEVA), A., i, 592.

1-iodoxy- (ORTOLEVA), A., i, 592.

1:5- and 1:8-dinitro-, conversion of, into nitronitrosenaphthols (GRAEBE), A., i, 24; (FRIEDLÄNDER), A., i, 150.

1:5- and 1:8-dinitro-, and 1:3:8-trinitro- (FRIEDLÄNDER), A., i, 150.

β-**Naphthalenecarboxylic acid**, ethyl ester, chloroimide of (STIEGLITZ and SLOSSON), P., 1900, 2.

1:8-**Naphthalenedicarboxylic acid**. See Naphthalic acid.

Naphthalene-1:3:5-trisulphonic acid (ERDMANN), A., i, 91.

Naphthalic acid (1:8-naphthalenedicarboxylic acid), preparation of (ANSELM and ZUCKMAYER), A., i, 175; (JAUBERT), A., i, 296.

sulphonic derivative and anhydride of, and their salts (ANSELM and ZUCKMAYER), A., i, 176.

αβ-**Naphthanthracene**, constitution of (GABRIEL and COLMAN), A., i, 232.

αβ-**Naphthanthraquinone**, constitution of (GABRIEL and COLMAN), A., i, 232.

Naphthaphenazine, 9-amino- (KEHRMANN and WOLFF), A., i, 450.

- Naphthapurpurin** (1:2:4-*trihydroxy- α -naphthaquinone*), from naphthazarin (JAUBERT), A., i, 42.
- α -Naphthaquinone**, action of nitrogen trioxide on (SCHMIDT), A., i, 299.
- 5-amino- (FRIEDLÄNDER), A., i, 150.
- dibromo-, malonic acid derivatives of (LIEBERMANN), A., i, 310.
- β -Naphthaquinone**, 3:2-chlorobromo- (HIRSCH), A., i, 670.
- α -Naphthaquinoneacetoacetic acid**, bromo-, ethyl ester, action of alcoholic potash on, and condensation of, with ethylamine (LIEBERMANN), A., i, 311.
- α -Naphthaquinone-3-acetoacetic, -3-benzoylacetic, and -3-oxalacetic acids**, 2-chloro-, ethyl esters (MICHEL), A., i, 669.
- β -Naphthaquinone-4-acetoacetic, -4-benzoylacetic, -4-malonic, and -4-oxalacetic acids**, 3-chloro-, esters of (HIRSCH), A., i, 670.
- β -Naphthaquinone-4-acetylacetone**, 3-chloro- and 3-bromo- (HIRSCH), A., i, 671.
- α -Naphthaquinone-3-acetylacetone, -3-benzoylaceton, and -3-dihydroresorcinol**, 2-chloro- (MICHEL), A., i, 669.
- β -Naphthaquinone-4-benzoylaceton, and -4-deoxybenzoin**, 3-chloro- (HIRSCH), A., i, 671.
- α -Naphthaquinone-benzoylphenylhydrazones**, -phenylbenzylhydrazones, and -phenylmethylhydrazones (McPHERSON), A., i, 124.
- β -Naphthaquinone-benzoylphenylhydrazones**, and -phenylmethylhydrazones (McPHERSON), A., i, 124.
- α -Naphthaquinonebis-1-phenyl-3-methylpyrasolons** (MICHEL), A., i, 670.
- α -Naphthaquinone-dimalonic acid and -isoidonedicarboxylic acid**, ethyl esters (LIEBERMANN), A., i, 311.
- Naphthaquinone-3-ethylacetamide**, bromo- (LIEBERMANN), A., i, 310.
- Naphthaquinoneoxalinediacetic acids** 1:2- and 2:3-, and their ethyl esters (THOMAS-MAMERT and WEIL), A., i, 459.
- Naphthatriazole** and its salts, and **Naphthatetrazole** (MARCKWALD and MEYER), A., i, 520.
- Naphthatriazole** mercaptan (MARCKWALD and MEYER), A., i, 520.
- Naphthazarin** (*dihydroxy- β -naphthaquinone*), diacetyl derivative of (THIELE and WINTER), A., i, 505.
- 1:2-Naphthasine-3:6'-disulphonic acid, sodium salt (MEIGEN and NORMANN), A., i, 702.
- 1-Naphthol, 4:5- and 4:8-dinitro- (FRIEDLÄNDER), A., i, 150.
- 5:4- and 8:4-nitronitroso-, and two isomeric *trinitro*- (GRAEBE), A., i, 24; (FRIEDLÄNDER), A., i, 150.
- β -Naphthol derivatives**, etherification of (DAVIS), T., 33; P., 1899, 210.
- α -nitroso- (MÖHLAU and STROEBACH), A., i, 368.
- Naphthols**, α - and β -, condensation of, with ethyl phenylpropionate (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
- Naphthol-X-acid, amino-**. See 8-Hydroxynaphthalene-4:6-disulphonic acid, 1-amino-.
- α -Naphtholcarboxylic acid**, methylester, nitro- and amino- (EINHORN), A., i, 441.
- α -Naphthol-2-carboxy-3-malonic acid**, ethyl ester (NEF), A., i, 23.
- β -Naphthoxyacetone** and its oxime, phenylhydrazones and semicarbazones (STOEBMER), A., i, 658.
- β -Naphthoxycinnamic acids**, α - and β - (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
- Naphthoxy-propionic, -n- and -isobutyric, and -isovaleric acids**, α - and β -, and their ethyl esters (BISCHOFF), A., i, 395.
- α -Naphthoyl- α -benzoic acid**, constitution of (GABRIEL and COLMAN), A., i, 232.
- Naphthoylbromo-ethyl- and -propylamides**, α - and β - (SAULMANN), A., i, 687.
- 1-Naphthyl iodochloride and its reactions (WILLGERODT and SCHLÖSSER), A., i, 282.
- β -Naphthyl mercaptan** (BOURGEOIS), A., i, 163.
- β -Naphthyl methyl, ethyl, and propyl ethers** and their halogen derivatives (DAVIS), T., 36; P., 1899, 210.
- 1-Naphthylamine, 4-chloro- (REVERDIN and CREPIEUR), A., i, 238.
- β -Naphthylamine derivatives**, action of aromatic aldehydes on (MORGAN), T., 1210; P., 1900, 171.
- Naphthylamines**, action of formaldehyde on (MORGAN), T., 814; P., 1900, 131.
- Naphthylcamphorformeneaminocarboxylic acids**, α - and β - (J. B. and A. TINGLE), A., i, 302.
- α - and β -Naphthylcarbamic acids, ethyl esters, and α - and β -Naphthylcarbimide (VITTENER), A., i, 154.
- Naphthylene**. See Methylcyclohexene.
- Naphthylene- α -diamines**, condensation of, with ethyl cetipate (THOMAS-MAMERT and WEIL), A., i, 459.

- Naphthylhydrazidoxalhydroxamic acids**, α - and β -, and their derivatives (THIELE and PICKARD), A., i, 30.
- β -Naphthyliminoethyl ether**, rearrangement of (WHEELER and ATWATER), A., i, 294.
- 2- α -Naphthyl-5-methylthiasoline** (SAULMANN), A., i, 687.
- Naphthylnitrosoamine** (ENGLER), A., i, 568.
- Naphthylloxazolines**, 2- α - and - β -, and their 5-methyl derivatives and their salts (SAULMANN), A., i, 687.
- Naphthylloxides**, sodium, compounds of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 395.
- Naphthylpenthiazolines**, 2- α - and - β - (SAULMANN), A., i, 687.
- α -Naphthyl-*m*- and -*p*-phenylenediamines** (MERZ and STRASSER), A., i, 253.
- Naphthylthiazolines**, 2- α - and - β -, and their salts (SAULMANN), A., i, 687.
- Naphthylthiosulphonacetacetic acids**, α - and β -, ethyl esters (TROEGGER and EVERS), A., i, 495.
- Narcocine** and its hydrates, hydrochloride and potassium derivative, thermochemistry of (LEBOY), A., ii, 131.
- Narcotics**, anæsthetizing action of (MEYER; BAUM), A., ii, 156.
- Narcotine methiodide**, action of silver chloride on (ROSER), A., i, 51.
- Narsarsukite** from Greenland (FLINK), A., ii, 412.
- Nascent state**, influence of, on the combination of oxygen and carbon monoxide (RUSSELL), T., 361; P., 1900, 42.
- Nasonite** from New Jersey (PENFIELD and WARREN), A., ii, 89.
- Nasturtium officinale***, constituents of (GADAMER), A., i, 49.
- Natrolite**, action of ammonium chloride on (CLARKE and STEIGER), A., ii, 414.
- Neobornylamine**, separation of, from bornylamine, rotatory power of, and action of ethyl oxalate on (FORSTER and HART-SMITH), T., 1152; P., 1900, 166.
- Neodymium**, spectra of (MUTHMANN and STÜTZEL), A., ii, 18.
- carbide, preparation and properties of (MOISSAN), A., ii, 726.
- Nephritis**, excretion of alloxuric substances in (MARTIN), A., ii, 155.
- Nepodin** (HESSE), A., i, 41.
- Neroli oil** (*orange blossom oil*) (JEANCARD and SATIE), A., i, 511; (E. and H. ERDMANN), A., i, 555.
- Nerves**, properties of, under the influence of certain poisons (WEDENSKI), A., ii, 739.
- Nerves**, action of the veratrine alkaloid- on (WALLER), A., ii, 425.
- Nerve tissues**, action of the tetanus toxin on (DANYEZ), A., ii, 156.
- physiological effects of extracts of (HALLIBURTON; OSBORNE and VINCENT), A., ii, 423.
- Nervous system** of the growing rat. decrease of water in the (DONALDSON), A., ii, 556.
- "**New methylene-blue**," acyl derivative of (COHN), A., i, 455.
- Nickel**, occurrence of, in Silesia (ASCHERMANN), A., ii, 86.
- electrolytic deposition of, polarisation in the (MARSHALL), A., ii, 185.
- passivity of (HITTORF), A., ii, 706.
- specific heat of (TILDEN), A., ii, 524.
- occlusion of hydrogen by (BAXTER), A., ii, 79.
- Nickel alloys** with iron, allotropic transformations of (DUMAS), A., ii, 408.
- Nickel arsenide** (GRANGER and DIDIER), A., ii, 349.
- azoimide (CURTIUS and DARAPSKY), A., ii, 474.
- borate (OUVRARD), A., ii, 207.
- carbonyl, decomposition of, in solution (LENHER and LOOS), A., ii, 349.
- fluoride, double salts with aluminium or ferric fluoride (WEINLAND and KÖPPEN), A., ii, 143.
- phosphide, preparation of (MARON-NEAU), A., ii, 281.
- selenides (FONZES-DIACON), A., ii, 730.
- sulphate, supposed decomposition of, by light (DOBROSERDOFF), A., ii, 658.
- combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1247; P., 1900, 173.
- hydroxylamine compound of, crystalline form of (UHLENHUTH), A., ii, 482.
- potassium sulphate (MALLER), T., 221; P., 1899, 227.
- Nickel organic compounds** :—
- ethylenediamine compounds of (KUBNAKOFF), A., i, 209.
- Nickel**, estimation and separation of :—
- estimation of, in nickel ores (LANGMUIR), A., ii, 316.
- estimation of, in nickel-steel (SARGENT), A., ii, 51.
- estimation of, colorimetrically, in nickel-steel (FIEBER), A., ii, 628.
- separation of, from cobalt, by the action of ammonium hydroxide on the ferricyanides (BROWNING and HARTWELL), A., ii, 765.

Nickel, estimation and separation of:—
separation of, from cobalt, by means of persulphates (MAWROW), A., ii, 596, 765.

separation of, from cobalt, by means of their sulphides (TOWER), A., ii, 690.

Nickel-steel, thermo-electrical properties of (STEINMANN), A., ii, 523, 524.

estimation of nickel in (SARGENT), A., ii, 51.

estimation of nickel in, colorimetrically (FIEBER), A., ii, 628.

Nicotine, action of, on circulation and respiration (WINTERBERG), A., ii, 424.

detection of (SCHINDELMEISER), A., ii, 380.

estimation of, in tobaccos (HARKER), A., ii, 778.

estimation of, in cigars and tobacco smoke (THOMS), A., ii, 428.

i-Nicotine (PICTET and ROTSCHY), A., i, 685.

reduction of nicotyrine to (PICTET), A., i, 685.

isoNicotinic acid (4-pyridinecarboxylic acid), preparation and derivatives of (TERNÁJGÓ), A., i, 559.

2:6-diiodo- (SELL and DOOTSON), T., 235; P., 1900, 9.

Nitragin. See Agricultural Chemistry.

Nitramines, formation of, from amine nitrates (BAMBERGER and HOFF), A., i, 435.

Nitrates. See under Nitrogen and also Agricultural Chemistry.

Nitric acid, oxide and peroxide. See under Nitrogen.

Nitrification. See Agricultural Chemistry.

Nitriles, additive compounds of, with tripyridinechromium trichloride (PFEIFFER), A., i, 688.

physiological action of (FIQUET), A., ii, 424.

Nitriles. See also:—

Acetonitrile.

α -Acetylpropionitrile.

Acetylxlaronitrile.

Benzonitrile.

Benzylsulphide-*p*-dicarboxylic acid, nitrile of.

Camphocenenitrile.

Cinnamonitriles.

Crotonitrile.

p-Cyantoline.

Dihydrocampholenitrile.

Diindonemalononitrile.

Dimethylacetylacetonitrile.

$\alpha\beta$ -Dimethylglutolactonic acid, nitriles of.

Nitriles. See:—

Ethoxybenzonitrile.

B-Furfuryl- α -*p*-chlorophenylacrylonitrile.

Glycollonitrile.

Hydroxybenzonitrile.

p-Hydroxymesitylenonitrile.

Methoxybenzonitrile.

Methylacetylmalononitrile.

Phenylacetoneitrile.

α -Phenylisobutyronitrile.

Phenylcinnamonitrile.

α -Phenyl-*p*-methoxycinnamonitrile.

α -Phenylmethylenedioxycinnamonitrile.

α -Phenylnitrocinnamonitriles.

α -Phenyl-*p*-isopropylcinnamonitrile.

Propionitrile.

Propionylacetonitrile.

5-*iso*Propylheptanone-2-nitrile-7.

p-Toluenitrile.

p-Tolylisobutyronitrile.

Nitritohydroximidodisulphates (DIVERS and HAGA), T., 432; P., 1900, 54.

Nitro-compounds, cryoscopic behaviour of, in formic acid (BRUNI and BERTI), A., ii, 591.

primary or secondary, ammonium salts of, and their separation (KONOWALOFF), A., i, 324.

coloured substances derived from (HANTZSCH and KISSEL), A., i, 89;

(JACKSON and GAZZOLO), A., i, 438.

additive compounds of, with sodium hydroxide or alkylloxides (HANTZSCH and KISSEL), A., i, 89;

(JACKSON and GAZZOLO), A., i, 433; (ANGELI), A., i, 553.

aromatic, action of sodium sulphides on (BLANKSMA), A., i, 226, 482.

isoNitro-compounds, history of the (HANTZSCH), A., i, 618.

Nitrogen, atomic weight of (DEAN), T., 117; P., 1899, 213.

quinquevalent (LACHMAN), A., i, 380; (VAUBEL), A., i, 485.

isomeric partially racemic salts containing (KIPPING), T., 861; P., 1900, 51.

stereochemistry of (LE BEL), A., i, 15; (MARCKWALD), A., i, 143.

fluorescence and afterglow accompanying an electric discharge in (LEWIS), A., ii, 702.

specific gravity of, at its boiling point (DRUGMAN and RAMSAY), T., 1228; P., 1900, 172.

products of the explosion of mixtures of acetylene and (MIXTER), A., i, 618.

absorption coefficient of, by aqueous solutions of dissociating substances (BRAUN), A., ii, 529.

- Nitrogen**, solubility of, in various liquids, at low temperatures (CLAUDE), A., ii, 649.
 from albumoses (FRIEDMANN), A., i, 265.
 basic, proportion of, in elastin (EUSTIS), A., i, 817.
 the condition of, in proteids (HAUSMANN), A., i, 317.
 from the decomposition of proteids, amount of (HENDERSON), A., i, 265.
 in malt, dissolution of the (PETIT and LABOURASSE), A., ii, 611.
- Nitrogen compounds**, spectroscopic method of determining the constitution of (BRÜHL), A., i, 210.
- Nitrogen bromides**, substituted, and their relation to bromo-substituted anilides and anilines (CHATTAWAY and ORTON), A., i, 152.
- Nitrogen bromides and chlorides**, substituted (ARMSTRONG), T., 1047; P., 1900, 160; (STIEGLITZ and SLOSSON), P., 1900, 2; discussion, P., 2.
 transformation of (CHATTAWAY, ORTON, and HURLEY), A., i, 151; (CHATTAWAY and ORTON), A., i, 152, 643.
 method of transforming (CHATTAWAY and ORTON), T., 796.
 from *o*- and *p*-acetotoluidides (CHATTAWAY and ORTON), T., 789; P., 1900, 102.
 ortho-substituted, and their transformation (CHATTAWAY and ORTON), T., 797; P., 1900, 112.
- Nitrogen chlorides**, substituted (CHATTAWAY and ORTON), T., 134; P., 1899, 232.
 from *m*-chloroacetanilide (CHATTAWAY, ORTON, and HURLEY), T., 800; P., 1900, 125.
- Nitrogen iodide**, N_2I (HANTZSCH), A., ii, 274.
 $N_2H_5I_2$, preparation and properties of so-called (CHATTAWAY and ORTON), A., ii, 399.
 formation and constitution of (CHATTAWAY and ORTON), A., ii, 722.
 composition of (CHATTAWAY), A., ii, 594.
 action of light on (CHATTAWAY and ORTON), A., ii, 594.
 action of acids on (CHATTAWAY and STEVENS), A., ii, 722.
 action of alkaline hydroxides, of water, and of hydrogen peroxide on (CHATTAWAY and ORTON), A., ii, 722.
 action of reducing agents on (CHATTAWAY and STEVENS), A., ii, 399.
 ammonium iodides (HUGOT), A., ii, 274.
- Nitrogen dioxide** (*nitric oxide*), action of, on chromyl dichloride (THOMAS), A., ii, 144.
- Nitrogen tetroxide** (*nitric peroxide*), thermal conductivity of (MAGNANINI and ZUNINO), A., ii, 525.
 as a solvent (BRUNI and BERTI), A., ii, 591.
 action of, on quinonedioximes (OLIVERI-TORTORICI), A., i, 553.
- Nitrogen acids**:—
Nitric acid, formation of, during combustion (BERTHELOT), A., ii, 475, 538.
 production of, from air, by means of the electric flame (McDOUGALL and HOWLES), A., ii, 651.
 very dilute, action of, on metals (VAN BIJLERT), A., ii, 204.
 analysis of, and when mixed with sulphuric acid (VAN GELDER), A., ii, 621.
 detection of, in animal matter (VITALI), A., ii, 46.
 detection of, in milk and in water (UTZ), A., ii, 438.
 estimation of (POOL), A., ii, 107; (VAN DEVENTER), A., ii, 242.
 estimation of, in water (HÖNIG), A., ii, 242.
- Nitrates**, origin of, in caves (HESS), A., ii, 550.
 action of *Bacillus coli* and *B. d'Eberth* on (GRIMBERT), A., ii, 97.
 metallic, reduction of, by lactic acid (VANINO and HAUSER), A., ii, 722.
 See also Agricultural Chemistry.
- Nitrous acid**, affinity constant of (SCHÜMANN), A., ii, 264.
 condition of, in aqueous solutions (SAPOSCHNIKOFF), A., ii, 722.
 sulphonation of, by sulphurous acid (DIVERS and HAGA), T., 688; P., 1900, 70.
 detection and estimation of very small quantities of (ERDMANN), A., ii, 243.
 detection of, in water (ERDMANN), A., ii, 243; (SPIEGEL), A., ii, 318; (MENNICKE), A., ii, 438, 621; (SCHAEER), A., ii, 438.
 estimation of, gasometrically, in presence of nitrates or other soluble salts (GAILHAT), A., ii, 686.
 estimation of, in water (ROMIJN), A., ii, 510.
- Nitrites**, interaction between sulphites and (DIVERS and HAGA), T., 673; P., 1900, 70.

Nitrogen acids:—

Hyponitrous acid, transformation of, into hydrazine (V. BRACKEL), A., ii, 594.

Nitrogen, detection and estimation of:—
detection of, in organic compounds containing sulphur (TÄUBER), A., ii, 107.

estimation of (VILLIERS and DUMESNIL), A., ii, 310.

estimation of, by Kjeldahl's method, improved apparatus for (MEHRING), A., ii, 509.

nitric, estimation of, by Schloesing's method (DAVIDSON), A., ii, 487.

estimation of, in fertilisers containing nitrates (VEITCH), A., ii, 166.

comparative estimations of, in salt-petre (V. WISELL), A., ii, 685.

estimation of, in urine (PFAUNDLER), A., ii, 674.

estimation of ammonia and, in water, apparatus for (WESTON), A., ii, 685.

Nitro-group, stereochemical behaviour of the (WDEKIND), A., i, 216.

elimination of a, during diazotisation (MELDOLA and WECHSLER), T., 1172; P., 1900, 167.

direct introduction of a, into the side chain of aromatic amines (BAMBERGER and HOFF), A., i, 435.

rate of substitution of, by an alkoxyl (DE BRUYN), A., i, 146.

Nitrohydroxylaminic acid and its salts (ANGELI and ANGELICO), A., ii, 594, 722.

"Nitroic acids" (HANTZSCH and KISSEL), A., i, 89; (ANGELI), A., i, 552.

Nitroprussides, detection of, in cases of poisoning (VENTUROLI), A., ii, 174.

Nitrosates (IPATIEFF and SOLONINA), A., i, 3.

Nitrosamines of methylated nitroanilines (BAMBERGER and MÜLLER), A., i, 217.

Nitroso-compounds from 2-ketocarboxylic esters (DIECKMANN; DIECKMANN and GROENEVELD), A., i, 297.

reaction of (ANGELI and ANGELICO), A., ii, 722.

aromatic, condensation of, with methylene derivatives (SACHS), A., i, 362.

fatty, preparation of (SCHMIDT), A., i, 332.

Nitrosyl chloride, action of, on organic compounds containing a double linking (IPATIEFF and SOLONINA), A., i, 14.

Nitrosyl chloride and its compounds with antimony, iron and tin chlorides (VAN HETEREN), A., ii, 187.

Nodes. See Agricultural Chemistry.

Nonaldehyde from German rose oil (WALBAUM and STEPHAN), A., i, 677.

Nopinone (WALLACH and SCHÄFER), A., i, 241.

Norpic acid from verbenone (KERSCHBAUM), A., i, 353.

Nortropan (norhydrotropidine) and its iminochloride (WILLSTÄTTER and IGLAUER), A., i, 458.

Nortropidine and its chloro-derivative (WILLSTÄTTER and IGLAUER), A., i, 458.

Nucleic acid from various sources, formula of (HERLANT), A., i, 466.

from salmon milt (SCHMIEDBERG), A., i, 267.

of the wheat germ (OSBORNE and CAMPBELL), A., i, 573.

solubility of uric acid in (KOSSEL and GOTO), A., ii, 421; (GOTO), A., ii, 740.

Nucleic acids, preparation of (LEVENZ), A., i, 572.

Nucleic acids, α - and β - , and Nucleothymic acid, preparation of (NEUMANN), A., i, 319.

Nuclein, metabolism of (LOEWI), A., ii, 417.

Nucleins, combination of, with metals, alkaloids, and toxins (STASSANO), A., ii, 559.

metabolism of (MILROY and MALCOLM), A., ii, 91.

Nucleons (KRÜGER), A., i, 128.

Nux vomica, composition of the albumen of (BOURQUELOT and LAURENT), A., ii, 498.

O.

Oats. See Agricultural Chemistry.

- α -Oximinoketones** as pseudo-acids (FARMER and HANTZSCH), A., i, 103.
- α -Oximine- β - and - γ -methyladipic acids** (DIECKMANN and GROENEVELD), A., i, 297.
- Oximinophenylacetoneitrile**, *p*-chloro- (V. WALTHER and WETZLICH), A., i, 438.
- Oximinopropionic acid**, hydroxamic acid of (WHITELEY), T., 1040; P., 1900, 145.
- Oxyazo-compounds**, constitution of (FARMER and HANTZSCH), A., i, 122.
- bromination of (ARMSTRONG and ISHERWOOD), P., 1900, 158.
- Oxybassorin** (HILGER and DREYFUS), A., i, 379.
- o*-Oxycarbanil and its ethers**, absorption spectra of (HARTLEY, DOBBIE, and PALIATSEAS), T., 839; P., 1900, 130.
- Oxycelluloses**, two, from cellulose (NASTUKOFF), A., i, 540.
- from cotton, flax, hemp, and rhea (VIGNON), A., i, 628.
- acetyl derivatives of (VIGNON and GERIN), A., i, 629.
- nitro- (VIGNON), A., i, 589, 629.
- Oxycobaltamine thiocyanates** (MASCETTI), A., i, 541.
- Oxycetarine**, and its bromo-derivative and salts (WULFF), A., i, 607.
- Oxydiethylenedisulphidedibromomethylsulphine** and its salts (STRÖMHOLM), A., i, 14.
- Oxydiethylenedisulphidemethylsulphine salts**, and the action of chlorine on (STRÖMHOLM), A., i, 326.
- Oxydiethylenedisulphidethetine** and its salts (STRÖMHOLM), A., i, 18.
- 5-Oxy-1:4-dimethyl-6:7-dihydropurine**. See Deoxytheobromine.
- 5-Oxy-1:4-dimethylpurine** and its derivatives (TAFEL; BAILLIE and TAFEL), A., i, 121.
- 2-Oxy-3-ethylpurine** and 5:7-dichloro- and iodo-, and their salts (ARMSTRONG), A., i, 636.
- Oxygen**, evolution of, at the anode in the electrolysis of alkali chloride solutions (FOERSTER and SONNEBORN), A., ii, 645.
- evolution of, from chlorates (SODERF), T., 137, 717; P., 1899, 157; 1900, 88.
- cause of the evolution of, when oxidisable gases are absorbed by permanganic acid (MORSE and BYERS), A., ii, 406.

Oxygen, specific gravity of, at its boiling point (DRUGMAN and RAMSAY), T., 1228; P., 1900, 172.
 solubility of, in various liquids, at low temperatures (CLAUDE), A., ii, 649.
 influence of the nascent state on the combination of carbon monoxide and (RUSSELL), T., 361; P., 1900, 42.
 influence of finely divided platinum on the combination of hydrogen and (FRENCH), A., ii, 718.
 combination of, with sulphur dioxide (RUSSELL and SMITH), T., 340; P., 1900, 41.
 the rendering, active (ENGLER), A., i, 399.
 active, formation of, in oxidation processes (MANCHOT), A., i, 300.
 atmospheric, oxidation with (BILTZ), A., i, 662.
 oxidation of potassium cobaltocyanide and of chromous salts by (MANCHOT and HERZOG), A., ii, 546.
 oxidations with free (OSTWALD), A., ii, 592.
 in human blood (LOEWY), A., ii, 357.
 absorption of free, by normal urine (BERTHELOT), A., ii, 740.
 estimation of, in copper, by ignition in hydrogen (ARCHBUTT), A., ii, 756.
 estimation of, in water (MUTSCHLER), A., ii, 106; (ZETSCHE), A., ii, 166.
 estimation of dissolved, in fresh-water, sea-water, sewage effluents, etc. (LETTS and BLAKE), A., ii, 755.
Oxyglutin, formation of (SACHAROFF), A., i, 268.
Oxyhæmoglobin. See under Hæmoglobin.
Oxyhydroditeressantialic acid (MÜLLER), A., i, 678.
Oxymethyl, *di*- and *tri*-bromo-, acetyl derivatives of (AUWERS and BROICHER), A., i, 162.
Oxymethyleneamphor, tautomerism of (BRÜHL), A., i, 497.
 β -Oxy- β -methyl- η -octene- ζ -one and its oxime and acetyl derivative (LÉSER), A., i, 130.
Oxymethylphosphoric acid (POSTERNAK), A., ii, 679.
2-Oxy-3-phenylpurine, 5:7-dichloro- (FISCHER), A., i, 417.
Oxyprotein (SCHULZ), A., i, 266.
5-Oxy-1:4:6-trimethyl-6:7-dihydropurine. See Deoxycaffeine.
Oxy-p-2-xyleneol, 8:5:6-*tri*- and *iso*:3:5:6-*penta*-bromo- and their acetyl derivatives (AUWERS and BROICHER), A., i, 162.

VOL. LXXVIII. ii.

Ozone, formation of, by a point-discharge in oxygen (WARBURG), A., ii, 721.
 production of, by the decomposition of water by fluorine (MOISSAN), A., ii, 13.
 apparatus for exhibiting the production of (TECLU), A., ii, 72.
 molecular weight of (LADENBURG), A., ii, 721.
 estimation of (TECLU), A., ii, 437; (BRUNCK), A., ii, 572.
 estimation of, from ozonisers (ACKERMANN), A., ii, 509.

P.

Pachyrhizide, a fish poison and its anhydride (VAN SILLEVOLDT), A., i, 109.
Palladium, atomic weight of (HARDIN), A., ii, 85.
Palladous ammonium trichlorosulphite (ROSENHEIM and ITZIG), A., ii, 282.
 potassium iodonitrite (ROSENHEIM and ITZIG), A., ii, 282.
Palladium organic compounds:—
Palladium, ethylenediamine compounds of (KURNAKOFF and GWOSDAREFF), A., i, 209.
Palladous potassium oxalonitrite (ROSENHEIM and ITZIG), A., ii, 282.
Pallado-bisphenylammonium chloride and bromide, -dipiperidium and -diquinolinium chlorides (HARDIN), A., ii, 85.
Pallado-oxalic acid and its salts (LOISELEUR), A., i, 542.
Palladium, detection of:—
 new microchemical test for (POZZI-ESCOFF and COUQUET), A., ii, 371.
Palladium black, action of a mixture of benzene vapour and hydrogen on (LUNGE and AKUNOFF), A., i, 543.
Palladium hydrogen, nature of (SHIELDS), A., ii, 215.
Palm kernels. See Agricultural Chemistry.
Pancreas, secretion of the (WALTER), A., ii, 558.
 autodigestion of the (PFÖRRINGER), A., ii, 28.
 glycolytic action of the (PIRELLINI), A., ii, 420.
 lactase of the (WEINLAND), A., ii, 93.
Pancreatic juice, influence of bile, of acid, and of alkalis on the proteolytic action of (RACHFORD), A., ii, 91.
Pancreatin, action of papain on (HARLAY), A., i, 468.
Papain, action of heat on (HARLAY), A., i, 420.

- Papain**, action of, on gelatin (SACHAROFF), A., i, 268.
 action of, on pepsin and pancreatin (HARLAY), A., i, 468.
 digestion of albumin and fibrin by (HARLAY), A., i, 419.
- Parabanic acid** (*oxalylcarbamide*), synthesis of (CAZENEUVE), A., i, 144.
- Parachymosin** and **chymosin** (BANG), A., ii, 356.
- Paraffins**, nitro-, new method for the preparation of (AUGER), A., i, 578.
 electrical conductivity of sodium derivatives of (SULC), A., ii, 332.
 action of alkalis on, and reduction of, and of their salts (DUNSTAN and GOULDING), T., 1266; P., 1900, 175.
 action of zinc alkyls on (BEWAD), A., i, 629.
 reactions of (HANTZSCH and KISSEL), A., i, 90.
- Paraformaldehyde**. See under **Formaldehyde**.
- Paramucosin** (LEATHES), A., i, 818.
- Paranelecin** from casein, phosphorus in (JACKSON), A., ii, 606.
- Parannucleo-compounds**, chemistry of (LEVENE and ALSBERG), A., ii, 555.
- Parapropaldehyde**. See **Propaldehyde**.
- Paraxanthine**. See **Xanthine**.
- Paris-green**, estimation of arsenic in (SMITH), A., ii, 47; (HAYWOOD; HILGARD), A., ii, 758.
- Parasite** from Greenland (FLINK), A., ii, 410.
- Paraleyl oil**, constituents of (BIGNAMI and TESTONI), A., i, 400.
- Parasip**. See **Agricultural Chemistry**.
- Parthenogenesis**, artificial (LOEB), A., ii, 555, 608; (VIGNIER), A., ii, 608.
- Passivity** of metals (HITTORF), A., ii, 705.
- Pastry**, examination of commercial (JUCKENACK; BEIN), A., ii, 460.
- Pears**, distribution of sugar, acid, and tannin in (KELHOFER), A., ii, 497.
- Pear trees**. See **Agricultural Chemistry**.
- Peas**. See **Agricultural Chemistry**.
- Peat**, accumulation of iron in (VAN BEMMELEN), A., ii, 215.
- Peat-meal molasses**. See **Agricultural Chemistry**.
- Peat soil**. See **Agricultural Chemistry**.
- Pectolite** from New Jersey (CLARKE and STEIGER), A., ii, 24.
 action of ammonium chloride on (CLARKE and STEIGER), A., ii, 24, 414.
- Pegmatites** of the Upper Valtin, minerals in (LINCK), A., ii, 286.
- Péligot's absorption apparatus**, improvement in (PANNERTZ), A., ii, 621.
- Pentacetoxy- β -naphthalene** (THIELE and WINTER), A., i, 505.
- Pentacetyl**. See under the **Parent Substances**.
- cycloPentadiene**, ketone reactions of (THIELE), A., i, 298.
 physiological action of (ELFSTRAND), A., ii, 423.
- Pentaglycol**. See **Dihydroxydimethylpropane**.
- Pentahydroxynaphthaquinone** and its pentacetyl derivative (THIELE and WINTER), A., i, 505.
- Pentamethylbenzhydrol** and its acetyl derivative (WEILER), A., i, 214.
- 3:5:3':4':6'-Pentamethyldiphenylmethane**, synthesis of (WEILER), A., i, 213, 284.
- Pentamethylene derivatives**, new series of (PERKIN, THORPE, and WALKER), P., 1900, 149.
 See also **cycloPentane**.
- Pentamethylenehexacarboxylic acid** (BOTTOMLEY and PERKIN), T., 294; P., 1900, 16.
- Pentamethylene-1:3:4-tricarboxylic acid**, *cis*- and *trans*-, synthesis of (BOTTOMLEY and PERKIN), T., 296; P., 1900, 16.
- Pentamethyloctohydro-xanthenedione** (VORLÄNDER and KALKOW), A., i, 100.
- Pentane**, physiological action of (ELFSTRAND), A., ii, 423.
- cycloPentane** (*pentamethylene*) derivatives, synthesis of, by means of ethyl adipate (BOUVEAULT), A., i, 171.
 See also **Pentamethylene**.
- Pentanedicarboxylic acids**. See **Dimethylglutaric acids**.
- Pentanehexacarboxylic acid**, ethyl ester (BOTTOMLEY and PERKIN), T., 294; P., 1900, 16.
- Pentanetricarboxylic acid** and its decomposition (BOTTOMLEY and PERKIN), T., 294; P., 1900, 16.
- 2-cycloPentanonecarboxylic acid** (*2-ketopentamethylenecarboxylic acid*) and its derivatives (BOUVEAULT), A., i, 171.
 diethyl ester, bisnitroso- (DIECKMANN), A., i, 297.
- Pentinene** (*isoprene*), constitution of (MOKIEWSKY), A., i, 509.
- Pentosans**, automatic apparatus for the estimation of (STANĚK), A., ii, 373.
- Pentose**, isolation of, from urine (BERGELL and BLUMENTHAL), A., ii, 378.
- Pentoses** (SULEIMAN BEY), A., i, 377.
 estimation of, in urine (SULEIMAN BEY), A., ii, 446.

- Pentylenedicarboxylic acid.** See Dimethylglutaconic acid.
- Pepper, Cayenne,** active principle of (MICKO), A., ii, 58.
- analysis of (GREGOR), A., ii, 775.
- Pepsin,** secretion of, in gastric disease (ROTH), A., ii, 422.
- action of papain on (HARLAY), A., i, 468.
- use of, for estimating the products of digestion (EFFRONT), A., ii, 59.
- Pepsin activity,** quantitative relationships of (SCHÜTZ), A., ii, 666.
- Peptone,** Lilienfeld's so-called (KLIMMER), A., i, 72.
- Peptones,** formation of (BOKORNY), A., i, 126.
- influence of, on urinary secretion (THOMPSON), A., ii, 226.
- Perozone** (*pipitzahoic acid*) as an indicator in alkalimetry (DUYK), A., ii, 308.
- Perfumes,** and the sense of smell (ERDMANN), A., ii, 367.
- behaviour of, in liquid air (ERDMANN), A., ii, 468.
- Perieline** from Salzburg (VIOLA), A., ii, 663.
- Periodic law,** isomorphism in the (BEHRENS), A., ii, 136.
- Periodic system,** representation of the (SCHIRMERSEN), A., ii, 397.
- Peronine.** See Morphine benzyl ether.
- Perowskite** from S. Ambrogio (BOERIS), A., ii, 600.
- Peroxides,** nomenclature of the (v. BAeyer and VILLIGER), A., i, 626.
- metallic, differences in reactions of (TANATAR), A., ii, 211.
- Petit grain,** oil of (JEANCARD and SATIE), A., i, 511.
- Petrocenes** and their derivatives (ZALOZIECKI and GANS), A., i, 593.
- Petroleum,** theory of the origin of (KRAEMER and SPILKER), A., i, 73.
- formation of (KRAEMER and SPILKER), A., i, 73; (ENGLER), A., ii, 216.
- new aromatic hydrocarbon from (KLAUDY and FINK), A., i, 284.
- hydrocarbons with high melting points from (ZALOZIECKI and GANS), A., i, 593.
- Californian, Canadian, Japanese, and Pennsylvanian, composition of (MABERY), A., i, 533.
- Roumanian (SALIGNY), A., ii, 282; (EDELEANU and FILITI), A., ii, 486.
- composition of (PONI), A., i, 617.
- Russian, composition of (WISCHIN), A., i, 146.
- Petroleum,** Texas, composition of (THIELE), A., ii, 147.
- heavy Texas, hydrocarbons in (MABERY and BUCK), A., i, 577.
- estimation of sulphur in (FRIEDLÄNDER), A., ii, 107.
- Petsite** from California (HILLEBRAND), A., ii, 22.
- Phenogams.** See Agricultural Chemistry.
- Phallin,** physiological action of (KOBERT), A., ii, 156.
- Pharmacosiderite** from Cornwall (HARTLEY), A., ii, 23.
- Phase rule.** See Equilibrium.
- Phascolus multiflorus.* See Agricultural Chemistry.
- Phenacetin,** action of sulphuric acid on (COHN), A., i, 29.
- test for, in antipyrine (RAIKOW and SCHARBANOW), A., ii, 456.
- Phenacetyltartaric acid,** diethyl ester, rotation of (MCCRAE and PATTERSON), T., 1096; P., 1900, 161.
- Phenanthraquinone,** *mono-* and *di-*nitro- (KEHRMANN and KIKINE), A., i, 61.
- Phenanthrene,** refraction of (CHILESOTTI), A., i, 339.
- Phenazthionium** chloride, platinum-chloride, and dichromate, 3:5-diamino- (KEHRMANN and SCHILD), A., i, 63.
- Phenazoxonium** bromide, diamino- (KEHRMANN and THOMAS), A., i, 62.
- Phenetidine,** detection of, in urine (EDLEFSEN), A., ii, 378.
- "*p*-Phenetidine, cyano-" and its acetyl and guanidine derivatives (MEVES), A., i, 483.
- p*-Phenetylcaramidesulphonic acid (COHN), A., i, 29.
- Phenoketopentamethyleneazine** (THOMAS-MAMERT and WEIL), A., i, 459.
- Phenol,** dissociation constant of (WALKER and CORMACK), T., 18; P., 1899, 208.
- equilibrium between water, hydrochloric acid and (KRUG and CAMERON), A., ii, 393.
- equilibrium between water, *d*-tartaric or racemic acid and; and water, acetone and (SCHREINEMAKERS), A., ii, 393.
- action of cyanogen bromide on (SCHOLL and NÖRR), A., i, 436.
- condensation of, with ethyl phenylpropionate (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
- action of phosphoryl chloride on (ODDO), A., i, 92.
- analysis of mixtures of cresols and (DITZ and CEDIVODA), A., ii, 54; (VAUBEL), A., ii, 112.

- Phenol**, estimation of (RIEGLER), A., ii, 112.
- Phenol**, *m*-amino-, condensation of, with ethyl acetosuccinate (V. PECHMANN; V. PECHMANN and SCHALL), A., i, 173; (V. PECHMANN and SCHWARZ), A., i, 174.
- p**-amino-, hydroxyazobenzene and sulphur, compounds from (RIS), A., i, 419.
- tri*-, *tetra*-, and *penta*-bromo- (AUWERS and ANSELMINO), A., i, 160.
- 4:6-dibromo-2-nitro- and 4:6-dibromo-2-amino- (THIELE and EICHWEDE), A., i, 501.
- mono*-, *di*-, and *tri*-chloro-, cyano-, and nitro-derivatives, hydrolysis of (HANTZSCH), A., i, 95.
- o*-nitro-, from nitrobenzene (WOHL), A., i, 157.
- p*-nitro-, as an indicator (SPIEGEL), A., ii, 754.
- 2:4:6-trinitro-. See Picric acid.
- nitroso-, alkaline solutions of, action of benzenediazonium chloride on (BORSCH), A., i, 24, 594.
- thio-. See Phenyl mercaptan.
- Phenol bromide**, tribromo-, constitution of (THIELE and EICHWEDE), A., i, 288.
- Phenol compounds**, new reagent for (CANDUSSIO), A., ii, 513.
- Phenol ethers**, action of cyanogen bromide and aluminium chloride on (SCHOLL and NÖRR), A., i, 386.
- Phenols**, influence of the solvent on the cryoscopic behaviour of (AUWERS, BARTSCH, and SMITH), A., ii, 66.
- action of benzenesulphonic chloride on, in alkaline solution (GEORGESCU), A., i, 343.
- bromination of (DITZ), A., i, 225; (DITZ and CEDIVODA), A., ii, 54; (VAUBEL), A., ii, 112.
- degradation of, during bromination (AUWERS and ANSELMINO), A., i, 159.
- action of, on ethyl acetylenedicarboxylate (RUHEMANN and BEDDOW), T., 1119; P., 1900, 165.
- action of ethylidene chloride on (FOSSE and ETTLINGER), A., i, 392.
- action of, on ethyl phenylpropionate (RUHEMANN and BEDDOW), T., 984, 1119; P., 1900, 123, 165.
- condensation of, with salol and with phenyl *p*-cresotol (COHN), A., i, 548.
- compounds of bismuth with (RICHARD), A., i, 598.
- crystalline compounds of, with succinimide (VAN BREUKELEVEN), A., i, 343.
- Phenols**, sodium derivatives, compounds of, with ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 345, 392, 393, 394, 395, 396, 442, 443, 445, 446.
- trisubstituted, action of ethyl nitrite on (THIELE and EICHWEDE), A., i, 501.
- estimation of (RIEGLER), A., ii, 112.
- Phenols**, amino-, action of phenyl cyanate on (FISCHER), A., i, 416.
- bromo-, insoluble in alkalis, formulae of (AUWERS), A., i, 96.
- oxidation products of (AUWERS; AUWERS and EBNER), A., i, 161; (AUWERS, BROICHER, and WOLFF), A., i, 162.
- reduction of (DITZ), A., i, 225; (VAUBEL), A., ii, 112.
- bromo- and chloro-derivatives, action of nitrous and nitric acids on (ZINCKE), A., i, 545.
- Phenols**, list of. See Alcohols and Phenols.
- Phenolasobenzeneazophenol** and its diacetyl derivative (MELDOLA and WILLIAMS), P., 1899, 196.
- Phenolphthalein**, precautions necessary in using, in acidimetric estimations (MAGNIER DE LA SOURCE), A., ii, 620.
- addition of, to marc wines (V. VAMOSSY), A., ii, 676.
- tetrabromo*-, and its oxime (MEYER), A., i, 447.
- Pheno- γ -pyrone**. See Chromone.
- iso*Phenosafranine and its salts (KEHRMANN and KRAMER), A., i, 61.
- Phenothiazine**, 3:5-diamino- and 3:5-dinitro- (KEHRMANN and SCHILD), A., i, 62.
- Phenoxazine**, diamino- (KEHRMANN and THOMAS), A., i, 62.
- Phenoxide**, sodium, condensation of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 345.
- Phenoxides**, nitro-, condensation of, with the esters of α -bromo-fatty acids (BISCHOFF), A., i, 442.
- Phenoxosone**, dinitro-. See *o*-Diphenylene oxide, 3:5-dinitro-.
- Phenoxyacetic acid**, 2:4:6-trichloro- and -tribromo-, and their ethyl esters (BISCHOFF), A., i, 443.
- Phenoxyacetophenone** (VANDEVELDE), A., i, 30.
- α -Phenoxybutyric acids**, and their esters (BISCHOFF), A., i, 345.
- o*-, *m*-, and *p*-nitro-, and their ethyl esters (BISCHOFF), A., i, 442.
- α -Phenoxyisobutyric acid**, 2:4-dichloro-, and its ethyl ester (BISCHOFF), A., i, 443.
- α -Phenoxycinnamic acid**, bromination of (VANDEVELDE), A., i, 30.

- β -Phenoxycinnamic acid** and its ethyl ester (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
ethyl ester, action of sulphuric acid on (RUHEMANN and STAPLETON), T., 1183; P., 1900, 168.
- Phenoxymaleic acid** and its ethyl ester and amide (RUHEMANN and BEDDOW), T., 1119; P., 1900, 165.
action of sulphuric acid on (RUHEMANN and STAPLETON), T., 1180; P., 1900, 168.
- Phenoxymaleic acid** (RUHEMANN and BEDDOW), T., 1119; P., 1900, 165.
- α -Phenoxy-propionacetal**, and -propaldehyde and its oxime and semicarbazone (STOERMER), A., i, 650.
- α -Phenoxypropionic acid**, 2:4-dichloro-, and *o*-, *m*-, and *p*-nitro-, and their ethyl esters (BISCHOFF), A., i, 442, 443.
- Phenoxypropionic acids**, α - and β -, and nitro- and amino- (BISCHOFF), A., i, 345.
- α -Phenoxypropionyl-*p*-phenetidine** (BISCHOFF), A., i, 345.
- Phenoxystyrene** (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
- α -Phenoxyisovaleric acid** (BISCHOFF), A., i, 345.
o-, *m*-, and *p*-nitro-, and their ethyl esters (BISCHOFF), A., i, 442.
- Phenetrol** and its ethyl ether and triacetyl derivative (KÖRNER), A., i, 224.
- Phenyl cyanate**, action of, on amino-phenols, and on uramil (FISCHER), A., i, 417.
ethyl carbonate, *o*- and *p*-amino-, *p*-nitro-, and *p*-ureido- (RANSOM), A., i, 220.
- Phenylacethydroxamic acid** and its acetyl derivative (THIRLE and PICKARD), A., i, 30.
- Phenylacetic acid**, β -phenylethyl ester (V. SODEN and ROVAHN), A., i, 489.
p-amino-, reduction of (EINHORN; EINHORN and LADISCH), A., i, 227.
and chloro- and nitro-, action of aldehydes on (V. WALTHER and WETZLICH), A., i, 438.
- ψ -Phenylacetic acid** (BRAREN and BUCHNER), A., i, 292.
- isoPhenylacetic acids**. See *cyclo*Heptatrienecarboxylic acids.
- Phenylacetimino-ethers**, rearrangement of (WHEELER and JOHNSON), A., i, 294.
- Phenylacetonitrile** (*benzyl cyanide*), condensation of, with ethyl cinnamate (ERLENMEYER), A., i, 493.
condensation of, with ethyl fumarate (HENZE), A., i, 347.
- Phenylacetonitrile** (*benzyl cyanide*), and chloro- and nitro-, action of aldehydes on (V. WALTHER and WETZLICH), A., i, 438.
- α -Phenyl-4-acetoxy-3-methoxycinnamic acid**, 2-nitro- and 2-amino- (PSCHORR and SUMULEANU), A., i, 488.
- Phenylacetylchloramine**, discrepancies in the description of its properties, and explanation of the manner it undergoes isomeric change (ARMSTRONG), T., 1047; P., 1900, 160.
See also Phenyl acetyl nitrogen chlorides.
- Phenylacetylene** and its salts, and bromo-, chloro-, and iodo-derivatives (NEF), A., i, 20.
action of hypochlorous and hypobromous acids on (WITTORF), A., i, 421.
- Phenylacetylenaniline**, iodo- (NEF), A., i, 22.
- Phenyl acetyl nitrogen chlorides**, chloro-derivatives of (*acetylchloroaminobenzene*) (CHATTAWAY, ORTON, and HURLEY), T., 800; P., 1900, 125.
- Phenyl acetyl nitrogen chlorides and bromides** (*acetyl-chloro- and -bromoaminobenzene*) and their transformation (CHATTAWAY and ORTON), T., 798; P., 1900, 112.
- β -Phenylacrylic acid**. See Cinnamic acid.
- Phenyl acyl nitrogen bromides** and their bromo-derivatives (CHATTAWAY and ORTON), A., i, 152.
- Phenyl acyl nitrogen chlorides**, *p*-mono- and 2:4:6-*tri*-chloro- (CHATTAWAY and ORTON), T., 134; P., 1899, 232.
- Phenyl acyl nitrogen chlorides and bromides**, and their behaviour to alkalis, potassium cyanide, and zinc ethyl (STIEGLITZ and SLOSSON), P., 1900, 1; discussion, P., 2.
See also Phenylacetylchloramine.
- α -Phenylalanine** and its phenylcarbimide (FISCHER and MOUNEYRAT), A., i, 647.
- Phenylallenecarboxylic acid** (DRBOGLAFF), A., i, 491.
- Phenylamine**. See Aniline.

- Phosphorechaleite** (*chile*) from near Wiesbaden (PETERSEN), A., ii, 662.

Phosphorus, preparation of, free from arsenic (NÖLTING and FEUERSTEIN), A., ii, 722.

supposed transformation of, into arsenic and antimony (WINKLER), A., ii, 476; (FITTICA), A., ii, 651; (NÖLTING and FEUERSTEIN), A., ii, 722.

in muscle (MACLEOD), A., ii, 92.

in paranuclein from casein (JACKSON), A., ii, 606.

metabolism of (NOËL-PATON, DUNLOP, and AITCHISON), A., ii, 222; (LEIPZIGER), A., ii, 223.

Phosphorus pentabromide, supposed allotropism of (KASTLER and BEATTY), A., ii, 538.

Phosphoryl bromide, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 75.

Phosphorus pentachloride, molecular weight of (ODDO and SERRA), A., ii, 74.

action of water and of phosphoric oxide on (ODDO), A., i, 92.

Phosphoryl chloride, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 75.

action of, on aromatic amines and on phenyl mercaptan, in presence of alkali (AUTENRIETH and RUDOLPH), A., i, 570.

action of water, of potassium chlorate, of aniline, and of phenol on (ODDO), A., i, 92.

Thiophosphoryl chloride, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 75.

Pyrophosphoryl chloride, preparation of (ODDO), A., i, 92.

Phosphorus, lower oxides of (MICHAELIS and PITSCH), A., ii, 137; (BESSON), A., ii, 539.

Phosphoric oxide, phosphorescence of (EBERT and HOFFMANN), A., ii, 517.

new compounds of, with benzene (GIRAN), A., i, 146.

Phosphoric acid, behaviour of, in presence of saturated solutions of calcium hydrogen carbonate (SCHLÖSING), A., ii, 541, 618.

double compounds of aromatic aldehydes and esters with (RAIKOW), A., i, 602.

estimation of, by molybdate (HANAMANN), A., ii, 311.

estimation of, as phosphomolybdic oxide (SHERMAN and HYDE), A., ii, 757.

estimation of, in basic slags (HERZFELD), A., ii, 243, 367.

Phosphorus :—

Phosphoric acid, soluble, Wagner's reagent for the estimation of, in basic slag (CASALI), A., ii, 311.

available, estimation of, in soil (PAGNOUL), A., ii, 167.

estimation of, in soil, by the humic acid method (HOFFMEISTER), A., ii, 244.

available as plant food, estimation of, in soils and manures (PIOT), A., ii, 510.

available, estimation of, in manure (VEITCH), A., ii, 166.

See also Agricultural Chemistry.

Phosphate solutions, metallic, electrolysis of (FERNBERGER and SMITH), A., ii, 109.

Phosphates, natural, estimation of alumina and ferric oxide in (VEITCH), A., ii, 577.

See also Agricultural Chemistry.

Metaphosphoric acid, identity of, with plasmic acid (ASCOLI), A., i, 128.

Metaphosphates (v. KNORRE), A., ii, 651.

Superphosphate, bone, detection of adulterations of (LASNE), A., ii, 167, 311.

Phosphorous acid, a general property of (VANINO), A., ii, 138.

Phosphotungstic acid as a test for potassium (WÖKNER), A., ii, 370.

Phosphorus trisulphide, preparation of (SPRINGER), A., ii, 399.

Phosphorus, detection and estimation of :—

detection of free (MUKERJI), A., ii, 756.

apparatus for the estimation of (SHIMER), A., ii, 50.

estimation of, by Reed's method (GERHARDT), A., ii, 108.

apparatus for the clinical estimation of, in blood (JOLLEN), A., ii, 311.

estimation of, in coal and coke (CAMP), A., ii, 756.

estimation of, in organic compounds (MARIE), A., ii, 108.

estimation of, in ores, pig-iron, and steel containing arsenic (CAMP), A., ii, 757.

estimation of, in steel, etc. (IBBOTSON and BREAKLEY), A., ii, 757.

Phosphoryl-anilide, -*p*-phenetide, and -*p*-toluidide, thio- (AUTENRIETH and RUDOLPH), A., i, 570.

Phosphoryl-brometoluidide, -*p*-chloro-anilide, and -*p*-phenetide and its nitro-derivative (AUTENRIETH and RUDOLPH), A., i, 570.

Phosphoxyanilides (ODDO), A., i, 92.

PHOTOCHEMISTRY:—

Light, chemical action of, compared with the chemical effects of the silent electric discharge (BERTHELOT), A., ii, 329.

influence of, on the electrical properties of metals (BUISSON), A., ii, 519.

oxidation and hydration of organic compounds under the influence of (BERTHELOT), A., i, 3.

sensitiveness of lead and silver to (WATERHOUSE), A., ii, 585.

influence of, on the action of chlorine on metallic silver (v. CORDIER), A., ii, 343, 723.

action of, on nitrogen iodide (CHATTAWAY and ORTON), A., ii, 594.

influence of, on the hydrolysis of platonic chloride (KOHLEBAUSCH), A., ii, 408.

influence of, on the transformation of styrene to metastyrene (LEMOINE), A., i, 91.

Photochemical effects produced by the Hertzian radiating wire (TOMMASINA), A., ii, 519.

experiments on silver chloride and bromide (LUTHER), A., ii, 181.

Photographic action of minerals containing thorium and uranium (AFANASSIEFF), A., ii, 702.

developers, brazilin and hæmatoxylin as (LEPETIT), A., ii, 519.

Latent image, theory of the (LUTHER; ABEGG), A., ii, 253; (ENGLISH), A., ii, 381.

Radiations from radium (BECQUEREL; VILLARD), A., ii, 381.

phosphorescence produced by (BECQUEREL), A., ii, 126.

effect of the magnetic field on (CURIE), A., ii, 126; (BECQUEREL), A., ii, 182, 183.

from thorium and uranium compounds (CURIE), A., ii, 81; (P. and S. CURIE; P. and S. CURIE and BÉMONT), A., ii, 82.

from uranium (BECQUEREL), A., ii, 518.

Radio-active substances (GIESEL), A., ii, 480.

new, from pitchblende (DEBIERNE), A., ii, 20, 350; (CURIE), A., ii, 81; (P. and S. CURIE; P. and S. CURIE and BÉMONT), A., ii, 82.

from thorium and its compounds (RUTHERFORD), A., ii, 351, 352.

from uranium ores (GIESEL), A., ii, 19.

from uranium residues, atomic weight of (CURIE), A., ii, 83.

PHOTOCHEMISTRY:—

Radio-active substances, spectrum of (DEMARÇAY), A., ii, 83.

radiation of (BECQUEREL), A., ii, 126.

rays from, influence of the magnetic field on (BECQUEREL), A., ii, 126.

See also Polonium and Radium.

Radio-active barium (v. LENGYEL), A., ii, 402; (GIESEL), A., ii, 480;

(DEBIERNE), A., ii, 586.

atomic weight of (CURIE), A., ii, 83, 654.

Radio-activity of uranium (CROOKES), A., ii, 586.

produced in substances by the action of thorium compounds (RUTHERFORD), A., ii, 352.

Becquerel rays, chemical action of (P. and S. CURIE), A., ii, 125.

action of the magnetic field on (CURIE), A., ii, 126.

and Röntgen rays, fluorescence of metallic compounds under the influence of (BARY), A., ii, 330.

Cathode rays, electrical conductivity in gases traversed by (MCLENNAN), A., ii, 587.

Röntgen rays, chemical action of, on glass (VILLARD), A., ii, 125.

absorption of, by aqueous solutions of metallic salts (BLYTHSWOOD and MARCHANT), A., ii, 182.

velocity of the ions produced in gases by (ZELENY), A., ii, 787.

Polarisation:—

Rotation, conditions determining the stability of (LE BEL), A., ii, 462.

of *d*- and *l*-isomarine and their acid tartrates (SNAPK) T., 784; P., 1900, 118.

of benzylidenecamphor (MINGUIN), A., i, 301.

of bornylamine salts, bornyloxamide, dibornyloxamide, and neobornylamine (FORSTER and HARTSMITH), T., 1152; P., 1900, 166.

of aromatic compounds of camphor (HALLER and MÜLLER), A., i, 182.

of alcoholic solutions of camphor, influence of the amount of water on (PARTHEIL and VAN HAAREN), A., i, 507.

of camphoroximeacetic acid and its salts (FORSTER and HARTSMITH), T., 1154; P., 1900, 166.

of *d*-erythrose and *d*-erythronic acid (RUFF and MEUSSER), A., i, 139.

of hydrindamine bromo- and chloro-camphorsulphonates and *cis*- π -camphanates (KIPPING), T., 884; P., 1900, 51.

PHOTOCHEMISTRY :—

- Rotation** of malic acid in the pure state and in solution (WALDEN), A., i, 11.
- of complex salts of malic and tartaric acids (ROSENHEIM and ITZIG), A., i, 185, 272.
- of methylethylphenacylsulphine *d*-bromocamphorsulphonates and pierates (SMILES), T., 1177; P., 1900, 168.
- of *d*-methylethylthetine platini-chloride, *d*-camphorsulphonate, and *d*-bromocamphorsulphonate (POPE and PEACHEY), T., 1072; P., 1900, 12.
- of ψ -nitrocamphane (FORSTER), T., 258; P., 1900, 13.
- of phenylosazones (NEUBERG), A., i, 139.
- of pilocarpine, isopilocarpine and pilocarpidine and their salts (JOWETT), T., 480.
- of acetyl and phenacetyl derivatives of diethyl *d*-tartrate (McCRAE and PATTERSON), T., 1096; P., 1900, 161.
- of sorbinose (SMITH and TOLLENS), A., i, 378.
- of starch (RODEWALD and KATTEIN), A., i, 477.
- of solutions of sucrose, influence of pressure on the (SIERTSEMA), A., ii, 329.
- variation of, with the temperature (SCHÖNROCK), A., i, 378.
- of active valeric acid (GUYE and ASTON), A., ii, 253.
- Magnetic rotation** in solutions of acids and salts, effect of concentration on (FORCHHEIMER), A., ii, 524.
- of the benzenoid hydrocarbons (PERKIN), T., 267; P., 1899, 237.
- of hexamethylene and *mono*- and *di*-chlorohexamethylene (PERKIN), T., 372; P., 1900, 44.
- Refraction** of metals (VAN AUBEL), A., ii, 125.
- of potassium chloride solutions (BENDER), A., ii, 461.
- of sodium tungstate solutions (PAWLEWSKI), A., ii, 400.
- of mixtures (PERKIN), T., 280; P., 1899, 237.
- of tautomeric substances (BRÜHL), A., i, 497.
- of aromatic compounds of camphor (HALLER and MÜLLER), A., i, 182.
- of ethyl ether near the critical point (GALITZIN and WILIP), A., ii, 461.

PHOTOCHEMISTRY :—

- Refraction** of hydrocarbons with condensed benzene nuclei (CHILESOTTI), A., i, 389.
- of the benzenoid hydrocarbons (PERKIN), T., 267; P., 1899, 237.
- of hexamethylene and *mono*- and *di*-chlorohexamethylene (PERKIN), T., 372; P., 1900, 44.
- Dispersion** of tautomeric substances (BRÜHL), A., i, 497.
- of aromatic compounds of camphor (HALLER and MÜLLER), A., i, 182.
- Spectrographic method**, value of, in tautomerism (HARTLEY and DOBBIE), T., 498; P., 1900, 57.
- of determining the constitution of nitrogen compounds (BRÜHL), A., i, 210.
- Spectra** of stars, origin of certain unknown lines in the (LUNT), A., ii, 585.
- of liquids in the ultra-red (PUCCIANTI), A., ii, 585.
- of gases, influence of slight impurities on (LEWIS), A., ii, 1, 701.
- of ammonia, methylamine, hydroxylamine, acetaldoxime and acetoxime (HARTLEY and DOBBIE), T., 318; P., 1900, 14.
- of argon, new lines in the (NASHNI, ANDERLINI, and SALVADORI), A., ii, 181.
- of bromine (EDER and VALENTA), A., ii, 330.
- of chlorine (EDER and VALENTA), A., ii, 72.
- of hydrogen and of water vapour (TROWBRIDGE), A., ii, 701.
- luminescence, of the rare earths (MUTHMANN and BAUR), A., ii, 544.
- new, of the rare earths (DEMARÇAY), A., ii, 656.
- of solutions of didymium and erbium salts, effects of dilution, temperature, etc., on (LIVING), A., ii, 517.
- of gadolinium magnesium nitrate (DEMARÇAY), A., ii, 597.
- of neodymium and praseodymium (MUTHMANN and STÜTZEL), A., ii, 18.
- of samarium (DEMARÇAY), A., ii, 404.
- of a radio-active substance (DEMARÇAY), A., ii, 83.
- of radium (DEMARÇAY), A., ii, 83, 586; (RUNGE), A., ii, 641.
- of silicon (LOCKYER), A., ii, 181.
- of vanadium (HASSELBERG), A., ii, 381.

PHOTOCHEMISTRY:—

- Spectra of benz-anti- and -syn-aldoximes** (HARTLEY and DOBBIE), T., 509; P., 1900, 58.
- of 2:5-dimethylpyrazine (HARTLEY and DOBBIE), T., 846; P., 1900, 129.
- of ethyl dibenzoylsuccinates (HARTLEY and DOBBIE), T., 498; P., 1900, 57.
- of hexamethylene and tetrahydrobenzene (HARTLEY and DOBBIE), T., 846; P., 1900, 129.
- of methylfurfuraldehyde and of vegetable products (WIDTSE and TOLLENS), A., i, 244.
- of *o*-oxycarbanil and its ethers (HARTLEY, DOBBIE, and PALATSEAS), T., 889; P., 1900, 130.
- of chlorophyll and its colouring matters (MARCHLEWSKI and SCHUNCK), T., 1080; P., 1900, 148.
- of the colouring matters of leaves (SCHUNCK), A., ii, 37.
- of hematorporphyrin (ARNOLD), A., i, 127.
- of bromohematorporphyrin and bromophylloporphyrin (MARCHLEWSKI and SCHUNCK), T., 1093.
- lamps for (BECKMANN), A., ii, 701.
- Spectrometer scale reader**, improved (PERKIN), T., 291.
- Photography**. See under Photochemistry.
- Photomethemoglobin**. See under Hemoglobin.
- Phototropy** (MARCKWALD), A., ii, 2; (BILTZ), A., ii, 125.
- See also Colour.
- Phrenosin**. See Cerebrin.
- Phthalaldehyde** and its tetracetate and dioxime and *iso*Phthalaldehyde tetracetate (THIELE and WINTER), A., i, 501.
- o*-Phthalaldehydic acid, compound of, with *o*-hydroxydiphenylacetic hydrazide (WEDEL), A., i, 363.
- Phthalanil**, 3:6-dichloro- (GRAEBE and GOUREVITZ), A., i, 547.
- Phthalic acid**, dichloro-, commercial, purification of (GRAEBE), A., i, 546.
- 3:6-dichloro- and its esters (GRAEBE), A., i, 546, 547; (GRAEBE and GOUREVITZ), A., i, 547.
- iso*Phthalic acid, diamino-, quinoneimide of (NIETZKI and PETRI), A., i, 486.
- tetramino-, formation of (NIETZKI and PETRI), A., i, 487.
- p*-Phthalic acid. See Terephthalic acid.
- Phthalide-di- and -tri-carboxylic acids**, synthesis of (DOEBNER), A., i, 499.

- Phthalidedimethyl ketone** and its salts and methyl derivative (FULDA), A., i, 36.
- Phthalimide**, bromo- and chloro-, conversion of, into acetylthranil and isatoic anhydride (BREIT and HOF), A., i, 229.
- 3:6-dichloro- (GRAEBE and GOUREVITZ), A., i, 547.
- Phthalonic acid** and its imide and **Phthalonamic acid** (GABRIEL and COLMAN), A., i, 360.
- Phthaloylphthalic acid**, anhydride and imide (LIMPRICHT), A., i, 600.
- Phthaloyltoluoylbenzoic acid** (LIMPRICHT), A., i, 600.
- Phthalylaminoacetic acid**, ethyl ester, action of sodium alkyl oxides on (GABRIEL and COLMAN), A., i, 358.
- Phthalyliminoacetone-amymercaptols**, diamyldisulphone, -benzylmercaptols, -dibenzylidysulphone, -phenylmercaptols, and -diphenyldisulphones (POSNER and FAHRENHORST), A., i, 17.
- Phthalyliminoketones**, transformations of (GABRIEL and COLMAN), A., i, 689.
- o*-Phthalylimino-propionic and -butyric acids, ethyl esters, action of sodium alkyl oxides on (GABRIEL and COLMAN), A., i, 358.
- Phyllades** from the Ardennes (READE and HOLLAND), A., ii, 150.
- Phylloporphyrin**, action of bromine on (MARCHLEWSKI and SCHUNCK), T., 1091; P., 1900, 149.
- Phyllorubin** (MARCHLEWSKI), A., i, 404.
- Phylloxanthin** (BODE), A., i, 109.
- Physical properties** and atomic weights (SANDER), A., ii, 137; (BAYLEY), A., ii, 188.
- Physical reactions**, and the mass law (LINCOLN), A., ii, 392.
- Physico-chemical reaction**, the driving tendency of, and its temperature coefficient (RICHARDS), A., ii, 533.
- Physiological action** and chemical constitution, relation between (PADERT), A., ii, 742.
- of acetonechloroform (*chlorotone*) (ALDRICH and HOUGHTON), A., ii, 358.
- of acetonedicarboxylic and citric acids (SABBATANI), A., ii, 32.
- of alkaloids of the Boraginæ (GREIMMER), A., i, 684.
- of alkylated alkaloids in relation to their chemical constitution (ROSENSTEIN), A., ii, 294.
- of anagryne and cytosine (SCHMIDT), A., i, 513.
- of antipyrine (LAWROFF), A., ii, 741.

Physiological action of Wakamba arrow poison (BRIEGER), A., i, 243.
 of bromine (FESSEL), A., ii, 227.
 of caffeine (KRÜGER), A., ii, 30, 93; (KATSUYAMA, KUWAHARA, and SENO), A., ii, 94; (BOCK), A., ii, 424.
 of carbohydrates (ROSENFELD), A., ii, 358; (CHARRIN and GUILLÉMONAT), A., ii, 606; (MÜNCH), A., ii, 607.
 of cheiranthin and cheirinine (REEB), A., i, 186.
 of chrysarobin and its oxidation product (MARFORI), A., i, 554.
 of creatine and creatinine (MALLET), A., ii, 156.
 of 3-cyano-1:2:3:4-tetramethylpyridone (SABBATANI), A., ii, 94.
 of drugs (FRÄNKEL), A., ii, 423.
 of formaldehyde (BRUNI), A., ii, 359.
 of extracts of sympathetic ganglia (CLEGHORN), A., ii, 557.
 of the poison of the Gila monster (VAN DEUBURG and WIGHT), A., ii, 677.
 of glucosamine hydrochloride (OFFER and FRÄNKEL), A., ii, 294.
 of 8-hydroxyquinoline (ROST), A., ii, 154.
 of *o*-hydroxyquinolinesulphonic acid (BRAHM), A., ii, 95.
 of iodine, sodium iodide and iodothyryl (BARBERA), A., ii, 291.
 of japaconitine (DUNSTAN and READ), T., 53.
 of menthol and menthyl acetoacetate (COHN and TAUSCH), A., i, 350.
 of *p*-mercuriodiphenylenetetraethylmercuridiummonium acetate (BENEDICENTI and POLLEDRO), A., ii, 359.
 of methylnitroamine, in relation to its constitution (SPRUYT), A., i, 142.
 of 1- and 4-methylxanthines (ALBANESE), A., ii, 424.
 of 4-methylxanthine (KRÜGER and SCHMIDT), A., ii, 31.
 of morphine (WINTERNITZ), A., ii, 221, 489; (IMPENS), A., ii, 228.
 of mucin (LEVIN), A., ii, 295, 555.
 of extracts of nervous tissues (HALLIBURTON; OSBORNE and VINCENT), A., ii, 423.
 of nicotine (WINTERBERG), A., ii, 424.
 of nitriles (FIQUET), A., ii, 424.
 of paraxanthine (KRÜGER and SCHMIDT), A., ii, 31.
 of pentane, cyclopentadiene, and valeraldehyde (ELFSTRAND), A., ii, 423.
 of phallin (KOBERT), A., ii, 156.
 of phloridzin (LEE and HARROLD; LUSK), A., ii, 558.
 of pilocarpine, isopilocarpine, and pilocarpidine (JOWETT), T., 497.

Physiological action of piperidinealkines (PADERI), A., ii, 742.
 of poisons (GUILLERY), A., ii, 95; (GIES and ASHER), A., ii, 291; (FRÄNKEL), A., ii, 423; (LINDEMANN), A., ii, 492; (WEDENSKI), A., ii, 739.
 of potassium chlorate (MELTZER), A., ii, 296.
 of protamines and their decomposition products (THOMPSON), A., ii, 227.
 of samandarine and of samandaridine sulphates (FAUST), A., i, 186.
 of soaps (MUNK), A., ii, 418.
 of Poehl's spermine (DIXON), A., ii, 676.
 of sugars (HÉDON and ARROUS), A., ii, 94.
 of tellurium compounds (GIES and MEAD), A., ii, 294.
 of theobromine (KRÜGER and SCHMIDT), A., ii, 31; (BOOK), A., ii, 424.
 of veratrine and protoveratrine (WALLER), A., ii, 425.
Physiology of the suprarenal capsules (BORUTTAU), A., ii, 225; (MOORE and PURINTON), A., ii, 492.
Phytosterol, retention of, in the organism, after feeding with cotton-seed oil (VIRCHOW), A., ii, 93.
 detection of, in fats (KREIS and RUDIN), A., ii, 252.
Picene, synthesis of (HIEN), A., i, 151.
Picotite from Steinegg, Austria (MRHA), A., ii, 218.
Pieramic acid, dicyano-(4:6-dinitro-2-amino-3:5-dicyanophenol). See *isopurpuric acid*.
Picric acid (2:4:6-trinitrophenol), and its solutions, colour of (MARCKWALD), A., i, 391.
 oxidation of, in presence of ferrous salts (FENTON and JONES), T., 76; P., 1899, 224.
Pieryl acetate, action of diazomethane on (v. PECHMANN), A., i, 313.
Pieryl chloride, improved method of preparing (JACKSON and GAZZOLO), A., i, 484.
 action of, on aromatic amines (WEDEKIND), A., i, 216.
 action of, on catechol (HILLYER), A., i, 289.
Pieryl- α - and - β -naphthylamines (BAMBERGER and MÜLLER), A., i, 217.
Pigment, green, of *Amanita muscaria* (GRIFFITHS), A., ii, 235.
 of the Arenicolæ (FAUVEL), A., ii, 227.
 blue, of coral (LIVERSIDGE), A., i, 70.

Figs. See Agricultural Chemistry.

Pilocarpidine, constitution, properties and salts of (JOWETT), T., 473; P., 1900, 50.

Pilocarpine and *isopilocarpine*, constitution, properties, reactions, salts and physiological action of (JOWETT), T., 473; P., 1900, 49.

Pilocarpine, constitution of (JOWETT), T., 494, 851; P., 1900, 50, 123; A., i, 686.

oxidation of, with permanganate (PINNER and KOHLHAMMER), A., i, 456, 685.

bromide derivatives, and oxidation of (PINNER and KOHLHAMMER), A., i, 456.

isopilocarpine, oxidation of, with permanganate, and reactions of, with soda lime, fused caustic potash, and methyl iodide (JOWETT), T., 851; P., 1900, 123.

Pilocarpoic acid, $C_{11}H_{16}O_8N_2$ (PINNER and KOHLHAMMER), A., i, 686.

Piluvic acid, $C_8H_{14}O_6$, and its salts (JOWETT), T., 855; A., i, 856; (PINNER and KOHLHAMMER), A., i, 685.

Pinacolin and its dioxime, and α -di-bromo- and α -dichloro- (WITTORF), A., i, 422.

Pinacone formate (BEHAL), A., i, 581.

Pinene, ψ - and σ -, formulæ of (SEMMLER), A., i, 453.

oxidation of (WALLACH and SCHÄFER), A., i, 241.

hydrochloride and hydriodide, relation of, to bornyl chloride and iodide (WAGNER and BRICKNER), A., i, 46.

Pinenol and its acetyl derivative (GENVRESSE), A., i, 351.

Pinenone and its oxime and acyl derivatives (GENVRESSE), A., i, 351.

i-**Pinocampholenic acid**, **Pinodihydrocampholenolactone**, *i*-**Pinonic** and *i*- and *l*-**Pinolic acids** (TIEMANN), A., i, 625.

Pinus Abies, cymene from (KLASON), A., i, 676.

Piperasine. See Diethylenediamine.

Piperidine (*hexahydropyridine*), action of, on α -benzoylamino cinnamic anhydride (ERLENMEYER), A., i, 550.

action of bromoacetophenone on (SCHMIDT and HARTONG VAN ARK), A., i, 686.

action of diazotised amino-compounds on (WALLACH and TEWES), A., i, 264.

action of iodine on (SCHMIDT), A., i, 187.

Piperidine (*hexahydropyridine*) derivatives, synthesis of (GUARESCHI and GRANDE), A., i, 111; (MINOZZI), A., i, 407.

synthesis of, in the organism (HILDEBRANDT), A., ii, 676.

abnormal aurichloride of (FENNER and TAFEL), A., i, 111.

Piperidinealkines. See Hydroxyethylpiperidines.

Piperidyl-mono- and -di-acetophenone and its salts (SCHMIDT and HARTONG VAN ARK), A., i, 686.

Piperonylacetone, nitro-, and its semicarbazone (ANGELI), A., i, 553.

Piperonylidene-d- and -l-camphor (HALLER), A., i, 301.

Piperylene nitrogen chloride (WILLSTÄTTER and IGLAUER), A., i, 458.

Pipitsaholic acid. See Perezone.

Pitchblende, radio-active substances from (DEBIERNE), A., ii, 20, 350; (CURIE), A., ii, 81; (P. and S. CURIE; P. and S. CURIE and BÉMONT), A., ii, 82.

Placenta and its ash, composition of the (GRANDIS), A., ii, 608, 609.

Plagioclase, composition of (TARASENKO), A., ii, 354.

Plagioliparites of Cape Marsa (DUPARC and PEARCE), A., ii, 220.

Plane tree. See Agricultural Chemistry.

Plankton from Kiel Bay, composition of (BRANDT), A., ii, 609.

Plants, estimation of cell-wall constituents, hemicelluloses, and cellulose in (KLEIBER), A., ii, 630.

See also Agricultural Chemistry.

Plasmic acid, identity of, with metaphosphoric acid (ASCOLI), A., i, 128.

Plasmolysis (VANDEVELDE), A., ii, 302.

Plasmon (PODA and PRAUSNITZ), A., ii, 289.

Platinum, influence of finely divided, on the combination of hydrogen and oxygen (FRENCH), A., ii, 718.

colloidal, as an inorganic ferment, and action of, on hydrogen peroxide (BREDIG and MÜLLER v. BERNECK), A., ii, 213.

commercial, cause of the loss of weight of, when heated under some conditions (HALL), A., ii, 659.

Platinum alloys with cadmium, magnesium and with zinc (HODGKINSON, WABING, and DESBOROUGH), A., ii, 282.

with gold, analysis of (PŁIWOZNIK), A., ii, 111.

Platinum compounds of hydroxylamine (UHLENHUTH), A., ii, 485, 659.

- Platinum tetrachloride** and its double salts (MIOLATI), A., ii, 214.
 hydrolysis of, on standing, and under the influence of light (KOHLEAUSCH), A., ii, 408.
- Tetrabromoplatinic acid** and **Penta-chloroplatinic acid** and their salts (MIOLATI and BELLUCCI), A., ii, 732.
- Platinum organic compounds** :—
Platinum bases, constitution of (JÖRGENSEN), A., i, 542; (BIILMANN), A., i, 543.
- Platodiammineplatosemi-ethylene** and -**ammine chlorides** (JÖRGENSEN), A., i, 542.
- Platosemiallyalcohol chloride**, compounds of, with potassium and with platodiamminechloride (BIILMANN), A., i, 543.
- Platosemi-ammine** and -**ethylene**, compounds of, with aminonium, potassium and silver chlorides (JÖRGENSEN), A., i, 542.
- Platinum, estimation of** :—
 estimation of small quantities of, in gold (RÖSSLER), A., ii, 733.
- Platinum black** as a compressed powder, electrical conductivity of (STREINTZ), A., ii, 641.
 action of a mixture of benzene vapour and hydrogen on (LUNGE and AKUNOFF), A., i, 543.
- Platinum wires**, fused-in, protection for (PALMAER), A., ii, 8.
- Plumbogummite** (HARTLEY), A., ii, 600.
- Plumieride**, identity of, with agoniadin (FRANCHIMONT), A., i, 680.
- Poisoning** by arsenic, rôle of leucocytes in (BESREDKA), A., ii, 156.
 detection of conine in cases of (VITALI and STROPPA), A., ii, 639.
 detection of nitroprussides in cases of (VENTUROLI), A., ii, 174.
 detection of opium in cases of (MECKE), A., ii, 180.
- Poisons**, chemical behaviour of, in the organism (FRÄNKEL), A., ii, 423.
 effect of, on eye muscles (GUILLERY), A., ii, 95.
 action of certain, on the kidneys (LINDEMANN), A., ii, 492.
 influence of, on the properties of nerve (WEDENSKI), A., ii, 739.
 protoplasmic, influence of, on lymph formation (GIES and ASHER), A., ii, 291.
- Polarisation**. See Electrochemistry and Photochemistry.
- Polonium** (GIESEL), A., ii, 20.
 from pitchblende (P. and S. CURIE), A., ii, 82.
- Polonium rays**, action of the magnetic field on (CURIE), A., ii, 126.
 existence of, doubtful (V. LENGYEL), A., ii, 402.
 See also Radio-active substances under Photochemistry.
- Polyspartic acids** (SCHIFF), A., i, 279.
- Polymethylenes**, cyclic, from Russian petroleum (WISCHIN), A., i, 146.
- Polyprene** (WEBER), A., i, 354.
- Polysaccharides**, hydrolysis of (ŠULC), A., ii, 395.
- Pomegranate root**, alkaloid $C_9H_{17}ON$ from (PICCININI), A., i, 110.
- Pomegranates**, Java, amount of alkaloids in (BECKURTS), A., ii, 563.
- Poplar bud oil** (FICHTER and KATZ), A., i, 108.
- Potassammonium**, action of, on arsenic (HUGOT), A., ii, 14.
- Potassium**, in the red corpuscles of the blood of animals (BOTTAZZI and CAPPELLI), A., ii, 225.
- Potassium amalgams** (KURNAKOFF), A., ii, 277; (GUNTZ and FÉREÉ), A., ii, 540; (KERP and BÖTTGER), A., ii, 656.
- Potassium salts**, isomorphous, crystallography of (CORIO), A., ii, 593.
 solubility curves of mixtures of (TOUREN), A., ii, 396, 530, 646.
- Potassium aluminates** (ALLEN and ROGERS), A., ii, 727; (HERZ), A., ii, 728.
 antimonic, arsenide, bismuthide and stannide, preparation of (LEBEAU), A., ii, 276.
 carbonate, solubility of solutions of, in aqueous ammonia (NEWTN), T., 775; P., 1900, 87.
 influence of the medium on the heat of solution of (GALITZKI), A., ii, 66.
 chlorate, electrolytic formation of (BROCHET), A., ii, 205, 276, 541.
 electrolytic reduction of (VOEGE), A., ii, 185.
 explosion of (BERTHELOT), A., ii, 139.
 action of, on phosphoryl chloride (ODDO), A., i, 92.
 decomposition products of (SODÉAU), T., 142; P., 1899, 157.
 toxicology of (MELTZER), A., ii, 296.
- perchlorate**, estimation of, in alkali nitrates (BLATTNER and BRASSEUR), A., ii, 755.
- chloride**, refraction of solutions of (BENDER), A., ii, 461.
 electrolysis of (BROCHET), A., ii, 205, 276.

- Potassium chloride**, electrical conductivity of solutions of (KOHLRAUSCH and MALTBY), A., ii, 61.
dissociation and dissociation equilibrium of (JAHN), A., ii, 522.
absorption of, from aqueous solution, by colloidal stannic oxide (VAN BEMMELN and KLOBBIE), A., ii, 338; (VAN BEMMELN), A., ii, 466.
and sodium chloride solutions, relationship between the composition of (WILSON), A., ii, 285.
compounds of, with acetylene and cuprous chlorides (CHAVASTELON), A., i, 470.
compounds of, with manganese chlorides (MEYER and BEST), A., ii, 77.
fluoride, compound of, with uranyl fluoride, and the action of hydrogen peroxide on (LORDKIPANIDZE), A., ii, 658.
fluorohyperborate (MELIKOFF and LORDKIPANIDZE), A., ii, 138, 139.
telluriodates (WEINLAND and PRAUSE), A., ii, 399.
iodide, titration of (VINCENT), A., ii, 166.
estimation of (BARRIE), A., ii, 755.
mercuriodide, dissociation of (FRANÇOIS), A., ii, 142.
permanganate, alkaline, as an oxidising agent (DONATH and DITZ), A., i, 197.
action of, on hydrogen peroxide and on Caro's acid (V. BÄYER and VILLIGER), A., ii, 719.
permanganomolybdates and the salts with ammonium (FRIEDHEIM and SAMELSON), A., ii, 547.
nitrate, electrical conductivity of solutions of (KOHLRAUSCH and MALTBY), A., ii, 61.
influence of the medium on the heat of solution of (GALITZKI), A., ii, 66.
formation and transition of mixed crystals of sodium nitrate and (HISSINK), A., ii, 339.
comparative estimations of nitrogen in (V. WISSELL), A., ii, 685.
estimation of potassium perchlorate in (BLATTNER and BRASSEUR), A., ii, 755.
nitrite, presence of, in brown powder residue (SETON and STEVENSON), A., ii, 276.
and cyanide, explosiveness of a mixture of (VAN GEUNS), A., i, 636.
- Potassium nitrite**, decomposition of, by alcoholic sulphur dioxide (DIVERS and HAGA), T., 437, 687.
and nitrate, mixed, solubility of (DIVERS), P., 1900, 40.
palladous iodonitrite (ROSENHEIM and ITZIG), A., ii, 282.
Dipotassium sodium cobaltinitrite (ADIE and WOOD), T., 1076; P., 1900, 17.
Potassium selenoantimonites and thioantimonites and their double salts with metals (POUGET), A., ii, 84.
ammonium silicovanadiomolybdates (FRIEDHEIM and CASTENDYCK), A., ii, 484.
sulphate, test by freezing point determinations of the dissociation values of solutions of (ARCHIBALD), A., ii, 65.
absorption of, from aqueous solution by colloidal stannic oxide (VAN BEMMELN and KLOBBIE), A., ii, 338; (VAN BEMMELN), A., ii, 466.
sulphates, compounds of, with metallic sulphates (MALLET), T., 216; P., 1899, 227.
persulphate, action of, on cobalt salts (MAWROW), A., ii, 596.
chromium sulphate (FAGEL), A., ii, 349.
magnesium sulphate, hydrate of (VAN'T HOFF and KASSATKIN), A., ii, 284.
manganese sulphate (MEYER and BEST), A., ii, 78.
nitrito-hydroximidosulphates (DIVERS and HAGA), T., 432; P., 1900, 54.
sulphazotised salts, Fremy's, identification and constitution of (DIVERS and HAGA), T., 440; P., 1900, 55.
hydrosulphides, sulphides and polysulphides (BLOXAM), T., 753; P., 1899, 146.
sulphite and thiosulphate, double, with silver and copper (ROSENHEIM and STEINHAUSER), A., ii, 652.
hydrogen chloro-oamisulphite (ROSENHEIM), A., ii, 660.
sodium sulphites, non-existence of two isomeric (FRAPS), A., ii, 276.
- Potassium organic compounds**:—
cyanide and nitrite, explosiveness of a mixture of (VAN GEUNS), A., i, 636.
action of, on aliphatic aldehydes (KOHN), A., i, 205.
as a condensing agent (SMITH), A., i, 38.
cobaltocyanide, oxidation of, by atmospheric oxygen (MANCHOT and HERZOG), A., ii, 546.

Potassium organic compounds:—

- ferrocyanide, decomposition of, by sulphuric acid (ADIE and BROWN-ING), T., 150; P., 1899, 226.
- rhodicyanide (LEIDIE), A., i, 212.
- selenocyanide (MUTHMANN and SCHRÖDER), A., i, 479.
- thiocyanate in human saliva (MENDEL and SCHNEIDER), A., ii, 554.
- platosemiallyalcohol chloride (BIILMANN), A., i, 543.
- platosemi-ethylene and -ammine chlorides (JØRGENSEN), A., i, 542.
- palladous oxalonitrite (ROSENHEIM and ITZIG), A., ii, 282.

Potassium, detection and estimation of:—

- detection of (BIILMANN), A., ii, 624.
- microchemical detection of (HUYSE), A., ii, 245.
- phosphotungstic acid as a test for (WÖRNER), A., ii, 370.
- estimation of, by phosphomolybdic acid (WAVELET), A., ii, 758.
- new method of estimating (ADIE and WOOD), T., 1076; P., 1900, 17.
- shortened method for estimating, in its salts (NEUBAUER), A., ii, 759.

Potatoes. See Agricultural Chemistry.

Potentials. See Electrochemistry.

- Powder, brown, composition of the residue of burnt** (SETON and STEVENSON), A., ii, 276.
- smokeless, tests for stability of (HOITSEMA), A., ii, 55.

Pozzuolana, natural and artificial (GEOIGIS and ALVISI), A., ii, 348, 545.

Praseodymium, spectra of (MUTHMANN and STÜTZEL), A., ii, 18.

carbide, preparation and properties of (MOISSAN), A., ii, 726.

- Pregnancy, effect of ingestion of alcohol during** (NICLOUX), A., ii, 416.
- increase of hepatic glycogen during (CHARRIN and GUILLEMONAT), A., ii, 292.
- influence of extract of ovaries on the changes produced in nutrition during (CHARRIN and GUILLEMONAT), A., ii, 554.

Prehnite in metamorphosed limestone (LACROIX), A., ii, 604.

action of ammonium chloride on (CLARKE and STEIGER), A., ii, 414.

Prehnitic acid. See 1:2:3:4-Benzene-tetracarboxylic acid.

Prehnitylic acid. See 2:3:4-Trimethylbenzoic acid.

Pressure and evaporation, relation between (HALL), A., ii, 9.

Propaldehyde, heat of combustion and of formation of (BERTHELOT and DELÉPINE), A., ii, 334.

condensation of, with acetaldehyde (SCHMALZHOFFER), A., i, 626.

Parapropaldehyde, β -iodo- (CHARON and PAIX-SÉAILLES), A., i, 472.

Propane, nitro-, secondary, action of alkalis on (DUNSTAN and GOULDING), T., 1266; P., 1900, 174.

cycloPropane. See Trimethylene.

Propanedicarboxylic acids. See:—
Glutaric acid.

Methylsuccinic acid.

cycloPropanedicarboxylic acid. See Trimethylenedicarboxylic acid.

Propanolmercury salts (SAND and HOFMANN), A., i, 885.

Propenolmercury salts (SAND and HOFMANN), A., i, 886; (HOFMANN and SAND), A., i, 619.

Propiolic acid, iodo-, reactions of (NEF), A., i, 23.

Propionaldazine (FRANKE), A., i, 213.

Propionamide, α -dichlorothio- (TROEGER and EWERS), A., i, 210.

Propionic acid, density of (V. HIRSCH), A., ii, 9.

estimation of, in acetic acid (MUSPRATT), A., ii, 375.

methyl ester, rate of hydrolysis of, at various temperatures (PRICE), A., ii, 528.

Propionic acid, β -chloro-, preparation of, and action of water on (DE BARR), A., i, 76.

α -thiocyano-, esters of, formation and boiling points of (WHEELER and BARNES), A., i, 565.

Propionitrile (ethyl cyanide), specific heat and heat of vaporisation of (LUGININ), A., ii, 334.

p-Propionyl-acetanilide and -aniline (KUNCKELL), A., i, 661.

Propionylaceto- ψ -cumidide, -o-toluidides, and -xylidide, bromo- (KUNCKELL), A., i, 664.

Propionylacetonitrile (HENRY), A., i, 538.

Propionylearbinol (HENRY), A., i, 538.

Propionyl-o-flavaniline (CAMPS), A., i, 310.

p-Propionylphenyl-carbamide, and -carbamie acid, ethyl ester (KUNCKELL), A., i, 665.

Propiophenonedicarboxylic acid (LIMPRIHT), A., i, 600.

β -Propoxy- β -phenylacrylic acid, α -cyano-, ethyl ester (HALLER and BLANC), A., i, 496.

Propyl phosphates, n- and iso-, and their lead and barium salts (CAVALIER and PROST), A., i, 579.

- n*-Propyl isocyanide (WADE), P., 1900, 157.
- β -isoPropylacrylic acid. See Hexenoic acid.
- isoPropylallylaniline and the action of cyanogen bromide on (V. BRAUN), A., i, 642.
- isoPropylamine abnormal aurichloride (FENNER and TAFEL), A., i, 111.
- β -Propylsec. amylhydroxylamine and its hydrochloride (BEWAD), A., i, 631.
- Propylbenzenes, *n*- and *iso*-, refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.
- 1-isoPropylbenzoxazole-4-carboxylic acid, ethyl ester (EINHORN), A., i, 441.
- isoPropylbenzylidenbis-2-methylindole (V. WALTHER and CLEMEN), A., i, 408.
- Propylisobutylamine and its salts (MARCKWALD), A., i, 143.
- isoPropyl butyl ketone and its oxime (NEF), A., i, 350.
- isoPropyl isobutyl ketone and its oxime and oxidation (PONZIO), A., i, 588.
- α -isoPropylbutyric acid. See Heptoic acid.
- Propylcatechol, preparation of (DE-LANGE), A., i, 289.
- 4-isoPropylcoumarone (STOERMER), A., i, 653.
- Propylene, action of, on mercuric salts (SAND and HOFMANN), A., i, 385.
- Propylene glycol, biochemical oxidation of (KLING), A., i, 129.
- mercuric salts (HOFMANN and SAND), A., i, 618.
- β -isoPropylglutaric acid (hexanedicarboxylic acid) (HOWLES, THORPE, and UDALL), T., 942; P., 1900, 115.
- β -isoPropylheptane- ϵ -oleic acid, lactone of (V. BAERER and VILLIGER), A., i, 183.
- 5-isoPropylheptanone-2-nitrile-7, and its isomeride (MAHLA and TIEMANN), A., i, 507.
- β -Propyl-sec.- and -tert.-hexylhydroxylamines and their salts (BEWAD), A., i, 631.
- isoPropylideneacetone. See Mesityl oxide.
- isoPropylidenediethylsulphone. See Sulphonal.
- α -isoPropylidene- γ -hexenoic acid (RUPE), A., i, 372.
- isoPropylkatoocoumarancarboxylic acid, ethyl ester (BISCHOFF), A., i, 397.
- β -isoPropylsevalic acid from the oxidation of the keto-lactone, $C_{10}H_{16}O_3$ (SEMMLER), A., i, 240.
- Propylmalonic acid (butanedicarboxylic acid), bromo-, and $\alpha\beta$ -dibromo-, synthesis with (WILLSTÄTTER), A., i, 405.
- p*-isoPropylphenoxy-acetal, and -aldehyde hydrate and its semicarbazone and thiosemicarbazone (STOERMER), A., i, 653.
- 4-*p*-isoPropylphenyldihydrodithiazine, 2,6-dicyano- (HELLSING), A., i, 518.
- β -*p*-isoPropylphenyl- α -methylhydroacrylic acid, synthesis of; and its salts (GRIGOROWITSCH), A., i, 597.
- Propylisopropylaniline, and the action of cyanogen bromide on (V. BRAUN), A., i, 642.
- $\alpha\alpha$ -Propylisopropylsuccinic acids, *cis*- and *trans*- (octanedicarboxylic acids), preparation and properties of (BONE and SPRANKLING), T., 654; P., 1900, 71.
- isoPropylpyrrolidone (TAFEL and STERN), A., i, 558.
- isoPropylstilbene, and *p*-nitro- (V. WALTHER and WETZLICH), A., i, 438.
- isoPropylsuccinimide (TAFEL and STERN), A., i, 558.
- Prostatic secretion, properties of (CAMUS and GLEY), A., ii, 674.
- action of, on the liquid of the vesicular seminales (CAMUS and GLEY), A., ii, 673.
- Protamine, a new—cyclopterine (MOR-KOWIN), A., i, 72.
- Protamines, classification of (KOSSEL and KUTSCHER), A., i, 466.
- and their decomposition products, physiological action of (THOMPSON), A., ii, 227.
- Proteids (albuminoids), classification of (KOSSEL and KUTSCHER), A., i, 466.
- coagulation temperature of (PAULI), A., i, 265.
- influence of nitrogenous substances on the heat-coagulation of (SPIRO), A., i, 615.
- reversible liquefaction of (TSVETIT), A., i, 67.
- pressure filtration of (HARRIS), A., ii, 222.
- the condition of nitrogen in (HAUSMANN), A., i, 317.
- amount of nitrogen obtainable from, by acids (HENDERSON), A., i, 265.
- decomposition of, by acids (BOKORNY), A., i, 126.
- fermentative decomposition of (JACOBY), A., ii, 671.
- formation of alcohol in the putrefaction of, free from carbohydrates (VITALI), A., ii, 297.
- action of alcohol on (ROSEMAN), A., ii, 92, 356.
- first cleavage product of the action of alkali on (MAAS), A., i, 708.

Proteids (*albuminoids*), behaviour of, to alkaloid reagents (COHNHEIM and KRIEGER), A., ii, 778.
 digestion of, by pepsin and trypsin, influence of alcohols on (LABORDE), A., ii, 151.
 action of arginine on the tryptic digestion of (LAWROFF), A., ii, 28.
 fat from (PFLÜGER), A., ii, 91, 92.
 origin of glycogen from (SCHÜNDORFF), A., ii, 740.
 tyrosine from (REACH), A., i, 126.
 influence of, on animals (PFLÜGER), A., ii, 91.
 absorption of, after feeding on meat and plasmon (MICKO), A., ii, 422.
 rate of absorption and of assimilation of, during fasting (MOSSO), A., ii, 605.
 fate of, when introduced into the circulation (MUNK and LEWANDOWSKY), A., ii, 154.
 and flesh, energy-value of (PFLÜGER), A., ii, 417.
 feeding value of (PFLÜGER), A., ii, 91, 92.
 iodine number of (BLUM), A., i, 67.
 formation of, in plants (EMMERLING), A., ii, 612.
 influence of light on the production of, in plants (PALLADIN), A., ii, 612.
 insoluble in gastric juice, conditions of the production of, and their importance for the respiration of plants (PALLADIN), A., ii, 613.
 plant, regeneration of, from their products of decomposition (PRIANISCHNIKOFF), A., ii, 233.
 ion-, compounds (LOEB), A., ii, 227.
 in albuminuria, origin of the (CLOËTTA), A., ii, 155.
 of blood and lymph, action of lymphagogues on (TIMOFÉFFSKY), A., ii, 95.
 of conifer seeds, decomposition products of (SCHULZE and WINTERSTEIN), A., ii, 101.
 of coniferous plants (SUZUKI), A., ii, 562.
 of cows' milk (STORCH), A., i, 266.
 of egg white, composition of (OSBORNE and CAMPBELL), A., i, 574.
 of egg yolk (OSBORNE and CAMPBELL), A., i, 616.
 of ovarian colloid (PANZER), A., i, 70.
 in the vegetative portions of plants (BOKORNY), A., ii, 426.
 of *Lupinus luteus* seedlings, decomposition products of (SCHULZE), A., ii, 101.

Proteids (*albuminoids*), coagulable, of connective tissues (GIES and RICHARDS), A., ii, 292.
 histon-like, from the thymus gland (FLEROFF), A., i, 71.
 of the wheat germ (OSBORNE and CAMPBELL), A., i, 573.
 test for (LINTNER), A., ii, 631.
 modification of Ritthausen's method of estimating (BARNSTEIN), A., ii, 779.
 precipitation of (SCHJERNING), A., ii, 779.
 animal, detection of glutamic acid in, by sulphuric acid (KUTSCHER), A., i, 67.
 estimation of absorbable, in foods (BÜLOW), A., ii, 549.
 separation of, from flesh-bases (WILEY), A., ii, 122.

- Pulegone**, oxidation of (MARKOWNIKOFF), A., i, 475. metabolism during poisoning with (LINDEMANN), A., ii, 223. reactions of (KLAGES), A., i, 44.
- Pump**, water vacuum, modification of the (ITTNER), A., ii, 718.
- Purine bases**, estimation of, in blood and animal organs (HIS and HAGEN), A., ii, 769. derivatives, a quantitative reaction of (JOLLES), A., ii, 454, 636. separation of, from urea (KRÜGER and SCHMIDT), A., ii, 81. substances, rôle of, in human metabolism (BURIAN and SCHUR), A., ii, 489.
- isoPurpuric acid**, constitution of (NIETZKI and PETRI), A., i, 485.
- Metapurpuric acid**, constitution of (BORSCHKE), A., i, 645.
- Pycnometer**, new (GÖCKEL), A., ii, 193.
- Pyocyanin**, the blue colouring matter of *Bacillus pyocyanus* (BOLAND), A., i, 70.
- Pyramidone** (*dimethylaminodimethylpyrazolone*), reactions of (HOFFMANN), A., ii, 379.
- Pyrazole-3:5-dicarboxylic acid** (GRAY), A., i, 376.
- Pyrazoledimethylenedinitrophenol** (v. PECHMANN), A., i, 313.
- Pyrazolinedimethylenepieryl acetate** (v. PECHMANN), A., i, 313.
- Pyridine**, action of, on bromoacetophenone (SCHMIDT and HARTONG VAN ARK), A., i, 687. action of sulphur dioxide and hydrogen sulphide on (ANDRÉ), A., i, 517. tellurium bromide and chloride (LENHER), A., i, 379. thori-chloride and -bromide (ROSENHEIM and SCHILLING), A., ii, 351. hydrochloride, double salt of, with bismuth chloride (HAUSER and VANINO), A., i, 641. tri- and tetra-thionates (ANDRÉ), A., i, 517. detection of (VONGERICHTEN), A., i, 51.
- Pyridine**, chlorine derivatives of, constitution of (SELL and DOOTSON), T., 1, 233; P., 1899, 205; 1900, 9. chloroamino-derivatives of, constitution of (SELL and DOOTSON), T., 4, 283, 771; P., 1899, 206; 1900, 9, 111.
- Pyridineacetophenone** and its salts and oxime chloride (SCHMIDT and HARTONG VAN ARK), A., i, 687.
- Pyridinebetaine** and its basic hydriodide (ORTOLEVA), A., i, 558.
- Pyridine-4-carboxylic acid**. See *iso*-Nicotinic acid.
- Pyridinecarboxylic acids** (PINNER), A., i, 409.
- Pyridine-2:6-dicarboxylic acid** (PINNER; PINNER and LEWIN), A., i, 409.
- Pyridinium penta-bromo- and -chlorochromate** (PFEIFFER), A., i, 559.
- Pyridoyl acetic acids**, α -, β -, and γ -, ethyl esters (PINNER), A., i, 409.
- 2-Pyridyl mercaptan**, methosulphide and sulphides (MARCKWALD, KLEMM, and TRABERT), A., i, 456.
- Pyridyl-2-methylsulphone**, -2-sulphonic acid, and -2-thioglycollic acid (MARCKWALD, KLEMM, and TRABERT), A., i, 456.
- Pyrites**, composition and heat of combustion of (CAVAZZI), A., ii, 598. estimation of pyrrhotite in (CARPENTER), A., ii, 763. estimation of sulphur in (HEIDENREICH), A., ii, 810.
- Pyrogallolsulphonic acid** and its salts (DELAGE), A., i, 595.
- Pyrographitic acid**, insoluble (STAUDENMAIER), A., ii, 15.
- Pyrojapaconine**, preparation, properties and aurichloride of (DUNSTAN and READ), T., 62; P., 1899, 207.

Pyrojapaconitine, preparation, properties, hydrolysis, and salts of (DUNSTAN and READ), T., 60 ; P., 1899, 207.

Pyrolusite from Moravia (KOVÁŘ), A., ii, 147.

Pyromeconic acid, constitution of (PERATONER and LEONARDI), A., i, 550.

Pyromucic acid, oxidation of, in presence of ferrous salts (FENTON and JONES), T., 76 ; P., 1899, 224.

isoPyromucic acid (SIMON), A., i, 198.

Pyromucosethylamide (WHEELER and ATWATER), A., i, 294.

α -Pyrone- α' -carboxylic acid (LAFWORTH), P., 1900, 132.

Pyrope from Steinegg, Austria (MRHA), A., ii, 218.

Pyrophyllite from North Carolina (CLARKE and STEIGER), A., ii, 24.
from Westanå, Sweden (WEIBULL), A., ii, 286.

Pyrotartaric acid. See Methylsuccinic acid.

n-Pyrotartaric acid. See Glutaric acid.

isoPyrotartaric acid (SIMON), A., i, 624.
ferric salt, as an indicator (SIMON), A., i, 625.

Pyroxene. See Augite.

Pyrrhotite (*magnetic pyrites*), estimation of, in pyrites ore (CARPENTER), A., ii, 763.

Pyrrrole-2-aldehyde and **Pyrrrolealdoxime** (BAMBERGER and DJIERDJIAN), A., i, 309.

2-Pyrrolidinecarboxylic acid and the action of methylamine on (WILLSTÄTTER), A., i, 405.

Pyrrrolidone and its mercury and bromo-derivatives (TAFEL and STERN), A., i, 557.

Pyrrroline-2-carboxylic acid (BAMBERGER and DJIERDJIAN), A., i, 309.
hydrazide of (PICCININI and SALMONI), A., i, 562.

2-Pyrrrolyl-ascimide and **-hydrazide** (PICCININI and SALMONI), A., i, 562.

2-Pyrrrolylurethane, and its nitroso- and acetyl-derivatives (PICCININI and SALMONI), A., i, 562.

Pyruvamide, oxime of (WHITELEY), T., 1045 ; P., 1900, 145.

Pyruvic acid, mercury salts and derivatives of (LEY), A., i, 382.
benzylhydrazones of (CURTIUS), A., i, 611.

4-quinaldylhydrazone of (MARCKWALD and CHAIN), A., i, 522.

Pyruvoylcollic acid, phenylhydrazone of (WOLFF and HEROLD), A., i, 585.

Q.

Quartz, solubility of, in sodium silicate solutions (SPEZIA), A., ii, 595.

Quassia, distinguishing between hops and (CHAPMAN), A., ii, 380.

Quercetin from various tannin matters (PERKIN), T., 423 ; P., 1900, 45.

4-Quinaldyl-hydrazine, and **-phenylthio-semicarbaside** (MARCKWALD and CHAIN), A., i, 521.

Quinizarin, bromine-derivatives of (LIEBERMANN and RIIBER), A., i, 451.

Quinobis- α -oxy-propionic, **-butyric**, and **-isovaleric acids** (BISCHOFF), A., i, 446.

Quinol, $C_{12}H_7O_2Cl_2$, from trichloroguaiacol and nitric acid (COUSIN), A., i, 487.

Quinol (1:4-*dihydroxybenzene*), condensation of the disodium derivative of, with esters of α -bromo-fatty acids (BISCHOFF), A., i, 446.

chloro-, **diacetyl** derivative of (THIELE and WINTER), A., i, 504.

o-dicyano- (THIELE and MEISENHEIMER), A., i, 299.

Quinolacetic acid. See *p*-Hydroxy-phenoxyacetic acid.

Quinoline derivatives, action of aldehydes on (KOENIGS), A., i, 189.

abnormal aurichloride (FENNER and TAFEL), A., i, 111.

hydrochloride, double salt of, with bismuth chloride (HAUSER and VANINO), A., i, 641.

methiodide (MARCKWALD and MEYER), A., i, 519.

tellurium bromide and **chloride** (LENHER), A., i, 379.

Quinoline, 6-amino-, and its acetyl, benzoyl and thionyl derivatives (KNUEPPEL), A., i, 187.

isoQuinoline derivatives, formation of (GABRIEL and COLMAN), A., i, 358.

1-mono- and **1:4-di-chloro-**, and its tetrahydride (GABRIEL and COLMAN), A., i, 358.

4-Quinolinealdehyde (KOENIGS), A., i, 246.

Quinoline-phenol, **-phenetole** and its **dicarboxylic acid** (KOENIGS), A., i, 247.

Quinolinic acid, esterification of (KIRPAL), A., i, 51.

2-Quinolones, **nitro-**, preparation of (DECKER), A., i, 689.

2-Quinolylhydrazine and its derivatives and its compounds with ethyl oxalate (MARCKWALD and MEYER), A., i, 519.

6-Quinolylhydrazine (KNUEPPEL), A., i, 188.

3-Quinolyl-phenylthiosemicarbazide and -semicarbazide (MARCKWALD and MEYER), A., i, 520.

Quinone, $C_{12}H_6O_4Cl_2$, from trichloroguaiacol and nitric acid (COUSIN), A., i, 487.

Quinone, production of, by *Streptothrix chromogena* (BEYERINCK), A., ii, 425.

addition of hydrogen cyanide to (THIELE and MEISENHEIMER), A., i, 299.

o-Quinone, tetra-bromo- and -chloro-, from tetra-bromo- and -chloro-guaiacol and -veratrol (COUSIN), A., i, 179, 487.

Quinonedioximes, action of nitrogen peroxide on (OLIVERI-TORTORICI), A., i, 558.

Quinones, action of acetic anhydride and sulphuric acid on (THIELE and WINTER), A., i, 504.

from benzene, estimation of, volumetrically (VALEUR), A., ii, 57.

Quinones, chloro-derivatives of, action of α -acylated phenylhydrazines on (McPHERSON and FISCHER), A., i, 411.

Quinones, list of. See Ketones and Quinones.

Quinonesacetylphenylhydrazones (McPHERSON), A., i, 123.

Quinoneshydrazones, constitution and derivatives of (FARMER and HANTZSCH), A., i, 122.

Quinonesoximes, stereochemistry of (KEHRMANN and KRÜGER), A., i, 180.

as pseudo-acids (FARMER and HANTZSCH), A., i, 103.

Quinopyridines, constitution and nomenclature of (WILLGERODT), A., i, 610.

Quinoquinoline, anhydrous chloride of, phototrophy of (MARCKWALD), A., ii, 2.

Quinoseol, composition of (ROST), A., ii, 154.

See also *o*-Hydroxyquinolinesulphonic acid.

Quinoxalidoneacetic acid, ethyl ester (RUHEMANN and STAPLETON), T., 243; P., 1900, 12.

6-Quinylurethane (KNEUPPEL), A., i, 188.

R.

Racemic acid. See under Tartaric acid.

Racemic amino-acids, resolution of, into optically active components (FISCHER), A., i, 172, 646; (FISCHER and MOUNEYRAT), A., i, 647.

Racemic compounds, some (SCHLOSSBERG), A., i, 376.

and stereoisomerides (COOPER), A., ii, 269.

characterisation of (ROOZEBOOM), A., ii, 64, 70, 132; (BRUNI), A., ii, 269;

(ADRIANI), A., ii, 462.

resolution of, into their active components (WALDEN), A., i, 7; (MARCKWALD and MCKENZIE), A., i, 207.

resolution of, into active components, by means of enzymes (FISCHER), A., i, 140.

resolution of, by means of moulds (ULPIANI and CONDELLI), A., ii, 493.

Racemisation occurring during the formation of benzylidene, benzoyl, and acetyl derivatives of *d*-ac-tetrahydro- β -naphthylamine (POPE and HARVEY), P., 1900, 74.

of optically active tin compounds (POPE and PEACHEY), P., 1900, 116.

Radiations and Radio-activity. See Photochemistry.

Radium (GIESEL), A., ii, 19.

existence of, doubtful (v. LENGYEL), A., ii, 402.

from pitchblende (P. and S. CURIE and BÉMONT), A., ii, 82.

radiations from (VILLARD), A., ii, 381.

transparency of aluminium to (BECQUEREL), A., ii, 381.

spectrum of (DEMARÇAY), A., ii, 83, 586; (RUNGE), A., ii, 641.

electric charge of the deviable rays of (P. and S. CURIE), A., ii, 254.

effect of the magnetic field on rays of (CURIE), A., ii, 126; (BECQUEREL), A., ii, 182, 183.

phosphorescence produced by radiations from (BECQUEREL), A., ii, 126.

behaviour of, at low temperatures (BEHRENDSEN), A., ii, 587.

See also Radio-active substances under Photochemistry.

Raffinose (*melitose*, *melitriose*), nutritive value of, for *Aspergillus niger* (GILLOT), A., ii, 99.

Rain-water. See under Water.

Ransättite (WEIBULL), A., ii, 287.

Rape cake. See Agricultural Chemistry.

Rat, growing, decrease of water in the central nervous system of the (DONALDSON), A., ii, 556.

Rate of substitution of a nitro-group by an alkoxy (DE BRUYN), A., i, 146.

Rathite from the Binnenthal (SOLLY and JACKSON), A., ii, 599.

Rays. See Photochemistry.

- Realgar.** See Arsenic sulphide.
- Receiver for fractional distillation in a vacuum** (FOGETTI), A., ii, 535.

condensation of, with homologous phloroglucinols (WEIDEL and WENZEL), A., i, 308.
- Salicylaldehyde**, 3:5-dibromo-, acetyl derivatives of (SIMONIS and WENZEL), A., i, 496.
- Salicylaldehydophenylhydrazones**, oxidation of (MINUNNI and CARTA-SATTA), A., i, 260.
- Salicylanilinoacetic acid**. See *o*-Carboxyphenylglycollic acid anilide.
- Salicylhydramide**, metallic derivatives of (DELEPINE), A., i, 177.
- Salicylic acid**, action of dry silver oxide and methyl iodide on (LANDER), T., 745; P., 1900, 6, 90.
mercury derivative of, and detection of, by Millon's reagent (LINTNER), A., ii, 631.
sodium salt, influence of, on metabolism (GOODBODY), A., ii, 670.
detection of, in presence of citric acid (LANGKOPF), A., ii, 695, 769; (CONRADY; GEROCK), A., ii, 769; (KLETT), A., ii, 770.
detection of, in milk (SÜSS), A., ii, 770.
cause of error in testing for, in wines (FERREIRA DA SILVA), A., ii, 695.
estimation of (MESSINGER), A., ii, 514.
estimation of, by ferric isopyrotritarate (SIMON), A., i, 625.
- Salicylic acid**, methyl ester, action of aniline and hydroxylamine on (TINGLE), A., i, 544.
phenyl ester. See Salol.
esters of, reaction of, with amines (TINGLE), A., i, 641.
- Salicylic acid**, amino-, glycinyl derivatives of the esters of (EINHORN and OPPENHEIMER), A., i, 494.
- 3-amino-**, derivatives of (ZAHN), A., i, 549.
- m-nitro-** (HILL, SOCH, and OENSLAGER), A., i, 538.
- α*-Salicyloxy-propionic**, ***n*-** and ***iso*-butyric**, and ***iso*-valeric acids** and their ethyl esters (BISCHOFF), A., i, 397.
- Salinigrin**, new glucoside from willow bark (JOWETT), T., 707; P., 1900, 89.
- Salipyrine**, metallic derivatives of constitution of (SCHUYTEN), A., i, 57; (BOURGEOIS), A., i, 193.
estimation of (BOUGAULT), A., i, 311.
- Saliva**, influence of acids on the amylolytic action of (HANFORD), A., ii, 666.
human, potassium thiocyanate in (MENDEL and SCHNEIDER), A., ii, 554.
- Salol**, action of amines, phenols, and sulphuric acid on (COHN), A., i, 548.
- Salt**, a, from Lake Djouvan-Tubé (MARKOWNIKOFF), A., ii, 660.
- Salts**, mixture of, having one common ion, solubility of (TOUREN), A., ii, 396, 530, 646.
acid, relation between taste and dissociation of (KAHLENBERG), A., ii, 270, 646; (RICHARDS), A., ii, 391.
fused, electrolysis of (LORENZ and HELFENSTEIN), A., ii, 833; (HELFENSTEIN), A., ii, 833; (QUINCKE; LORENZ), A., ii, 644.
solid and fused, relation between polarisation and current density in (GOCKEL), A., ii, 704.
solid, and their solution, difference of potential between (CAMPETTI), A., ii, 704.
inorganic, in non-aqueous solutions, electrical conductivity of (LINCOLN), A., ii, 6.
- Samandarine and Samandaridine** (FAUST), A., i, 186.
- Samarium** (DEMARÇAY), A., ii, 404.
oxide, crude, new element in (DEMARÇAY), A., ii, 481.
- Sand**, estimation of, in clays (CRONQUIST), A., ii, 171.
separation of, from clay in soils (SCARLATA), A., ii, 368.
- Sandalwood oil**, East Indian, constituents of (GUERBET), A., i, 242, 401; (v. SODEN; MÜLLER), A., i, 677.
West Indian, constituents of (v. SODEN), A., i, 401; (DEUSSEN), A., ii, 579.
- Sandarac resin**, examination of (DIETRICH), A., ii, 118.
- Sandmeyer's and Gattermann's reactions**, electrolytic modification of (VOTOČEK and ZENŠEK), A., i, 19.
- Sandstone** concretions from West Cheshire (MOORE), A., ii, 150.
- Sanidine** from Monte Cimino, Rome (ZAMBONINI), A., ii, 603.
- Santalene**, **Santalols**, **Santalal**, **Santalie acid** from Bombay oil of sandalwood (GUERBET), A., i, 242.
- Santalenes**, ***α*-** and ***β*-** (GUERBET), A., i, 242, 401.
- iso*Santalenes**, isomeric (GUERBET), A., i, 402.
- Santalol** from West Indian sandalwood oil (DEUSSEN), A., ii, 579.
- Santalols**, ***α*-** and ***β*-** (GUERBET), A., i, 242, 402; (v. SODEN), A., i, 677.
- Santalone** and its oxime from East Indian sandalwood oil (MÜLLER), A., i, 678.

- Santene**, C_9H_{14} , from East Indian sandalwood oil (MÜLLER), A., i, 678.
- Santonie acid**, and its dioxime and **Meta-santonie acid** (FRANCESCONI), A., i, 101.
- Santonin**, action of, on vision (FILEHNE), A., ii, 424.
estimation of (THAETER), A., ii, 122, 775; (KATZ), A., ii, 583.
- α -Santonin**, tribromo- (FRANCESCONI), A., i, 102
- Saponification**, the theory of (LEWKOWITSCH), P., 1899, 190.
See also Hydrolysis.
- Saponite** from Moravia (KOVÁŘ), A., ii, 149.
- Sartorite** from the Binnenthal (SOLLY and JACKSON), A., ii, 599.
- Saturation sludge**, acids in (ANDRLÍK), A., ii, 679.
- Savin**, oil of, constituents of (FROMM), A., i, 402.
- Saw palmette** (*sabal serrulatum*), fruit of (SHERMAN and BRIGGS), A., ii, 102.
- Schinoxidase** from *Schinus molle*, and the function of iron in (SARTHOU), A., i, 575.
- Schisolite** from Greenland (WINTER), A., ii, 418.
- Schröterite** from Saalfeld, Thuringia (ZAMBONINI), A., ii, 150.
- Scölecite**, action of ammonium chloride on (CLARKE and STEIGER), A., ii, 414.
- Scopolamine** (HESSE), A., i, 50; (GADAMER), A., i, 356.
- i*-Scopolamine**. See Atroscine.
- Sea urchin**, unfertilised eggs of, artificial production of normal larvæ from (LOEB), A., ii, 555.
- Sea water**. See under Water.
- Sea-weed**. See *Ulva latissima*.
- Selenite**, dehydration of (ZUNINO), A., ii, 479.
- Selenium**, allotropic forms of (SAUNDERS), A., ii, 650.
isomorphism of, with tellurium (NORRIS and MOMMERS), A., ii, 537.
dioxide, action of sodium thiosulphate on (NORRIS and FAY), A., ii, 272.
- Selenates**, double, of the type R_2M (SeO_4) $_2$.6H $_2$ O, crystallography of (TUTTON), A., ii, 593.
- Selenotetrathionic acid**, sodium salt of (NORRIS and FAY), A., ii, 272.
- Selenium organic compounds**:—
- Selenium compounds**, cyano- (MUTHMANN and SCHRÖDER), A., i, 479.
- Selenium**, detection and separation of:—
test for, in sulphuric acid (SCHLAGDENHAUFFEN and PAGEL), A., ii, 342.
- Selenium**, separation of:—
separation of, from tellurium (CRANE), A., ii, 473; (KELLER), A., ii, 573.
- Selenoantimonites** (POUGET), A., ii, 84.
- Semicarbasinopropionic acid**, acyl derivatives of (BAILEY and ACREE), A., i, 528.
- Semicarbasones**, decomposition of (KIRPING), P., 1900, 68.
hydrolysis of (YOUNG and WITHAM), P., 1900, 73.
- Semicarbasylcamphorformenecarboxylic acids** (J. B. and A. TINGLE), A., i, 803.
- Seminase** (BOURQUELOT and HÉRISSEY), A., i, 320; ii, 35, 233.
- Senna leaves**, constituents of (TSCHIRCH and HIEPE), A., i, 681.
- Serpentine** from Silesia, nickel in (ASCHERMANN), A., ii, 86.
- Serum**, antidiphtheric, granular deposit from (MAILLARD), A., i, 266.
antihæmatic (NOLF), A., ii, 741.
antihepatic (DELEZENNE), A., ii, 675.
antileucocytic, action of, on blood (DELEZENNE), A., ii, 423, 554.
hæmolytic (BORDET), A., ii, 741.
and red corpuscles (CANTACUZÈNE), A., ii, 741.
ox-, albumin in (HOUGARDY), A., i, 709.
- Serum-globulin**, solubility of, in water (MARCUS), A., i, 127.
- Sesame oil**, constituents of (BÖMER and WINTER), A., ii, 178.
analysis of (UTZ), A., ii, 699.
Baudouin's test for (KERF), A., ii, 116.
colour tests for (BELLIER), A., ii, 117.
detection of, in butter (WEIGMANN), A., ii, 40; (SOHN), A., ii, 55; (KERF), A., ii, 116; (BREMER; SOLTSIEN), A., ii, 325; (AMTHOR), A., ii, 453.
detection of, in margarine (BÖMER and WINTER), A., ii, 178; (BREMER; SOLTSIEN), A., ii, 325; (AMTHOR), A., ii, 453.
- Sesamin**, properties of (BÖMER and WINTER), A., ii, 178.
- Sesquimethylenesparagine** (SCHIFF), A., i, 85.
- Sesquiterpene** from oil of poplar buds (FICHTER and KATZ), A., i, 108.
- Sesquiterpenes** from citronella oil (SCHIMMEL and Co.), A., i, 184.
- Sewage effluents**, estimation of dissolved oxygen in (LETTS and BLAKE), A., ii, 755.
- Sheep**. See Agricultural Chemistry.
- Shells of Mytilus and Pinna**, organic substance of the (WETZEL), A., ii, 555.

Shock, surgical, use of alkaline solutions in (HOWELL), A., ii, 558.

Silica. See **Silicon dioxide**.

Silicon, spectrum of (LOCKYER), A., ii, 181; (LUNT), A., ii, 585.

amorphous, and its chloride and sulphide, preparation of (HEMPEL and v. HAAS), A., ii, 275.

Silicon borides, SiB_3 and SiB_5 , preparation and properties of (MOISSAN and STOCK), A., ii, 539.

tetrachloride, hydrolysis of (v. KOWALEWSKY), A., ii, 731.

dioxide (silica), expansion of fused (LE CHATELIER), A., ii, 539.

permeability of molten, to hydrogen (VILLARD), A., ii, 652.

estimation of, in chrome ore (TATE), A., ii, 313.

estimation of, colorimetrically, in mineral waters (SALVADORI and PELLINI), A., ii, 367.

Silicates, constitution and classification of (BUTURANU), A., i, 285.

fused, solidification of, under high and normal pressure (OETLING), A., ii, 149.

Silicovanadiumolybdates (FRIEDHEIM and CASTENDYCK), A., ii, 483.

Silicon organic compounds :—

Silico-phenylamide, -diphenylimide, and -triphenylguanidine (REYNOLDS), T., 836; P., 1900, 135.

Silicon, estimation of :—

estimation of, in ferro-chromium (TATE), A., ii, 313.

Silver, electrolytic deposition of, from non-aqueous solutions (KAHLENBERG), A., ii, 521.

sensitiveness of, to light (WATERHOUSE), A., ii, 585.

electrochemical equivalent of (RICHARDS, COLLINS, and HEIMROD), A., ii, 256.

action of chlorine on, in the light and in the dark (v. CORDIER), A., ii, 343, 723.

reversible reaction between hydrogen chloride and (JOUNIAUX), A., ii, 139.

Silver salts, complex (HELLWIG), A., ii, 728.

action of sodium thiosulphate on (FAKTOR), A., ii, 691.

Silver halogen salts, solubility of (THIEL), A., ii, 521.

double, with ammonium thiosulphate (ROSENHEIM and STEINHÄUSER), A., ii, 653.

Silver bromide and chloride, photochemical experiments on (LUTHER), A., ii, 181.

Silver bromide, chloride and iodide, precipitated, equilibrium in (THIEL), A., ii, 521.

platosemiammine chloride (JÖRGENSEN), A., i, 542.

fluoride, electrochemical properties of (ABEGG and IMMERWAHR), A., ii, 256.

compound of, with ammonium fluoride (GRÜTZNER), A., ii, 541.

hydroxide, absorption of hydrogen by (COLSON), A., ii, 241.

nitrate, formation and transition of mixed crystals of sodium nitrate and (HISSINK), A., ii, 339.

formation and transformation of the double salts of thallium nitrate and (VAN EIJK), A., ii, 403.

peroxynitrate (SULC), A., ii, 595.

oxide, action of acetylene on (GOOCH and BALDWIN), A., i, 74.

action of, on bromoamines (KIJNER), A., i, 277, 333, 629.

dry, and alkyl iodides, alkylation by means of (LANDER, T., 736; P., 1900, 6, 90.

peroxide, action of hydrogen sulphide on (VANINO and HAUSER), A., ii, 279.

peroxysulphate (MULDER), A., ii, 724.

sulphite and thiosulphate, double salts with the alkali metals (ROSENHEIM and STEINHÄUSER), A., ii, 652.

thioantimonites, double salts with alkali metals (POUGET), A., ii, 84.

Silver organic compounds :—

peroxyacetate (MULDER), A., ii, 724.

platosemi-ethylene chloride (JÖRGENSEN), A., i, 542.

Silver, detection and estimation of :—

detection of, by dimercurous ammonium chloride (LETEUR), A., ii, 246.

estimation of, volumetrically (ANDREWS), A., ii, 760.

estimation of, by Volhard's method (ROSE), T., 232; P., 1900, 5.

estimation of, on plated copper utensils (GIRARD), A., ii, 170.

Silver bullion, assay of (ROSE), T., 232; P., 1900, 5.

Skin, absorption of iodides by the (GALLARD), A., ii, 419.

Slags, basic, valuation of (DAFERT), A., ii, 167.

estimation of phosphoric acid in (HERZFELD), A., ii, 243, 367.

Wagner's reagent for the estimation of soluble phosphoric acid in (CASALI), A., ii, 311.

See also Agricultural Chemistry.

- Slates** (READE and HOLLAND), A., ii, 150.
- Soap emulsions**, nature of (DONNAN), A., ii, 201.
- Soaps**, action of, in the body (MUNK), A., ii, 418.
 absorption of, in the large intestine (HAMBURGER), A., ii, 418.
 analysis of (SHUKOFF and NOGIN), A., ii, 326.
 analysis of the fatty matter of (SMETHAM and DODD), A., ii, 377.
 estimation of free alkali in (DIVINE), A., ii, 759.
 estimation of total and free alkali and alkali carbonate in (HENRIQUES and MAYER), A., ii, 687.
 estimation of glycerol in (JEAN), A., ii, 694.
 glycerin-, estimation of sugar in (FREYER), A., ii, 373.
 estimation of the water-softening power of (RICHARDSON and JAFFE), A., ii, 326.
- Soda**, natural, from Egypt (SCHWEINFURTH and LEWIN), A., ii, 283.
- Sodium**, electrical effects produced during the evaporation of, in air and other gases (HENDERSON), A., ii, 588.
 in the red corpuscles of the blood of animals (BOTTAZZI and CAPPELLI), A., ii, 226.
 in cartilage (v. BUNGE), A., ii, 92.
- Sodium alloys** with bismuth, with cadmium, with lead, and with mercury, composition and melting points of (KURNAKOFF), A., ii, 277.
- Sodium amalgams** (KURNAKOFF), A., ii, 277; (GUNTZ and FÉREÉ), A., ii, 540; (KEEP and BÜTTGER), A., ii, 656.
- Sodium aluminates** (ALLEN and ROGERS), A., ii, 727; (HERZ), A., ii, 728.
 antimonide, arsenide, bismuthide and stannide, preparation of (LEBEAU), A., ii, 276.
 baborate (borax), separation of boric acid from (BEYTHIEN and HEMPEL), A., ii, 318.
 carbonate, use of, in surgical shock (HOWELL), A., ii, 558.
 detection of, in milk (SÜSS), A., ii, 759.
 chloride, relationship between the composition of solutions of potassium chloride and (WILSON), A., ii, 285.
 electrolysis of (WOLF), A., ii, 382; (LORENZ and WEHRLIN), A., ii, 476.
- Sodium chloride**, electrical conductivity of solutions of (KOHLEAUSCH and MALTBY), A., ii, 61.
 dissociation and dissociation equilibrium of (JAHN), A., ii, 523, 707.
 viscosity of solutions of (HOSKING), A., ii, 336.
 poisonous character of (LOEB), A., ii, 227.
 changes in the composition of the blood after transfusion of (MAGNUS), A., ii, 665.
 influence of solutions of, injected subcutaneously, on proteid metabolism (KREUMACHER), A., ii, 670.
 poisonous properties of, towards plants (COUPIN), A., ii, 236.
 fluoride, compound of, with uranyl fluoride, and the action of hydrogen peroxide on it (LORDKIPANIDZE), A., ii, 658.
 iodide, influence of, on the circulation (BARBERA), A., ii, 291.
 nitrate, electrical conductivity of solutions of (KOHLEAUSCH and MALTBY), A., ii, 61.
 formation and transition of mixed crystals of potassium nitrate and, and of silver nitrate and (HIS-SINK), A., ii, 339.
 estimation of potassium perchlorate in (BLATTNER and BRASSEUR), A., ii, 755.
 See also Agricultural Chemistry.
- nitrite**, colour and physical properties of solutions of (BOGUSKI), A., ii, 75.
- cobalt nitrite**, preparation of (BIHLMANN), A., ii, 624.
 and salt of, with potassium (ADIE and WOOD), T., 1076; P., 1900, 17.
- dioxide**, hydrate of, thermochemistry of (DE FORCRAND), A., ii, 129.
- phosphates** (v. KNORRE), A., ii, 651.
- selenoantimonites** and complex salts with sulphur and thioantimonites (POUGET), A., ii, 84.
- selenotetrathionate** (NORRIS and FAY), A., ii, 272.
- silicate solutions** as a solvent of quartz (SPEZIA), A., ii, 595.
- sulphate**, test by freezing point determinations of the dissociation values of solutions of (ARCHIBALD), A., ii, 65.
- chromium sulphate** (PAGEL), A., ii, 349.
- hydroximidodisulphate**, gradual decomposition of (DIVERS and HAGA), T., 978; P., 1900, 147.

- Sodium hydrosulphides, sulphides and polysulphides** (BLOKAM), T., 753; P., 1899, 146.
- sulphides, action of, on aromatic nitro-compounds (BLANKSMA), A., i, 226, 482.
- sulphite, decomposition of an ice-cold solution of, by carbon dioxide (DIVERS and HAGA), T., 681.
- hydrogen sulphite, combination of, with organic compounds by an ethylene linking (LABBE), A., i, 149.
- hyposulphite (BERNTSEN and BAZLEN), A., ii, 203.
- osmisulphite and chloro-osmisulphite (ROSENHEIM), A., ii, 660.
- potassium sulphites, non-existence of two isomeric (FRAPS), A., ii, 276.
- sulphite and thiosulphate, double, with silver and copper (ROSENHEIM and STEINHÄUSER), A., ii, 652.
- thiosulphate, fusion of (KÜSTER and THIEL), A., ii, 68.
- decomposition of, by acids (v. OETTINGEN), A., ii, 400.
- crystalline hydrates of (TAYLOR), A., ii, 206.
- action of, on bismuth and iron salts (FAKTOR), A., ii, 692.
- action of, on chromium and silver salts (FAKTOR), A., ii, 691.
- action of, on lead salts (FAKTOR), A., ii, 688, 691.
- action of, on mercury salts (FAKTOR), A., ii, 627.
- titration of mercury salts by (NORTON), A., ii, 689.
- action of, on potassium antimony tartrate (FAKTOR), A., ii, 598.
- action of, on selenium dioxide, and on tellurium dioxide (NORRIS and FAY), A., ii, 272.
- detection of (HUYSE), A., ii, 245.
- tungstate, solubility of, in water, and the density and refractive index of its solution (PAWLEWSKI), A., ii, 400.
- Sodium, detection of, in presence of potassium** (SCHOORL), A., ii, 625.

 observations on the reaction between picric chloride and aromatic amines (WEDEKIND), A., i, 216.

Stereoisomerides and racemic compounds (COOPER), A., ii, 269.
Stilbene (*s-diphenylethylene*) and its derivatives, preparation of; (v. WALTHER and WETZLICH), A., i, 438.
 refraction of (CHILESOTTI), A., i, 339.
Stokesite from Cornwall (HUTCHINSON), A., ii, 89, 603.
Stomach, chemical processes in the (SCHUYTEN), A., ii, 509.
 formation of hydrochloric acid in the (WESENER), A., ii, 92.
 See also Gastric juice.
Stomach contents, relationship between the nitrogen and chlorides of the (WINTER and FALLOISE), A., ii, 554.
Storax, examination of (DIETEBICH; EVERES), A., ii, 118.
Streptococcus hornensis (BOEKHOUT), A., ii, 742.
Streptothrix chromogena, biology of (BEYERINCK), A., ii, 425.
Strontium salts, toxic action of, in plant culture (COUPIN), A., ii, 363; (SUZUKI), A., ii, 561.
Strontium amalgam (KERP and BÖTTGER), A., ii, 656.
Strontium aluminates (ALLEN and ROGERS), A., ii, 727.
 chromate, action of ammonium chloride on (DUMESNIL), A., ii, 625.
 dioxide, hydrated and anhydrous, heat of formation of (DE FORCRAND), A., ii, 344.
 phosphide, crystallised (JABOIN), A., ii, 76.
 sulphide, phosphorescent, preparation of (MOURELO), A., ii, 141.
Strontium, detection and separation of:—
 detection of barium, calcium and (DUMESNIL), A., ii, 625.
 separation of, from barium and calcium (KÜSTER), A., ii, 108.
Strophanthic acid (FEIST), A., i, 556.
Strophanthidin and its isomeride, strophanthidolactone (FEIST), A., i, 555.
Strophanthin and ψ -Strophanthin, and their hydrolysis (FEIST), A., i, 555.
Strychnine, action of chloroform, iodoform, and methylene iodide on (TROWBRIDGE), A., i, 187.
 additive derivatives of (TROWBRIDGE), A., i, 517.
 salts, behaviour of, to chloroform (HILL), A., ii, 455.
 estimation of (FARR and WRIGHT), A., ii, 778.
Strychnine, tetrachloro- and its oxime, and hexachloro- (MINUNNI and ORTOLEVA), A., i, 309.

- Styrene** (*cinnamene*; *phenylethylene*), influence of light on the transformation of, into metastyrene (LEMOINE), A., i, 91.
 action of iodine and mercuric oxide on (BOUGAULT), A., i, 641.
- C-Styrenylhydroxytriazole** and its acetyl derivatives (YOUNG and WITHAM), T., 294; P., 1900, 5.
- Styrolene** diformate (BEHAL), A., i, 581.
- Styrylcarbamie acid**, methyl and ethyl esters (THIELE and PICKARD), A., i, 30.
- Styryltrichloromethylcarbinol**, synthesis of, its acetyl derivative, and the action of aqueous potassium hydroxide on (DRBOGLAFF), A., i, 490.
- Suberone**. See *cyclo*Heptanone.
- Sublimation**, apparatus for (RIIBER), A., ii, 468.
- Submaxillary gland**. See Gland.
- Substance**, m. p. 132-133°, from acetone and persulphuric acid (v. BAEYER and VILLIGER), A., i, 133.
 m. p. 120°, from an alcoholic solution of acetophenone (OECHSNER DE CONINCK and DERRIEN), A., i, 508.
 m. p. 180° and 182°, from alcoholic solutions of benzophenone (OECHSNER DE CONINCK and DERRIEN), A., i, 502.
- $N_2H_4S_2O_8$, and its salts, from the decomposition of ammonium amidosulphite (DIVERS), P., 1900, 104.
- $C_6H_5O_4Hg_4NO_3$, from the action of methylalcoholic potash and mercuric oxide on potato-starch (HOFMANN), A., i, 384.
- $C_6H_5O_4N_2$, from the electrolytic oxidation of acetoxime (SCHMIDT), A., i, 332.
- $C_6H_5O_4Hg_4NO_3$, from the action of methylalcoholic potash and mercuric oxide on sucrose (HOFMANN), A., i, 384.
- $C_6H_{10}O_4S_2$, from trimethylenedisulphone and formaldehyde (KÖRTZ), A., i, 370.
- $C_6H_5O_4N_4$, from the action of nitric acid on acetylene (BASCHIERI), A., i, 534.
- $C_6H_5OCl_4$, from the action of chlorine monoxide on benzene (SCHOLL and NÖRR), A., i, 337.
- $C_6H_5O_2$, from the hydrolysis of acetylcarbonyl acetate (PERATONER and LEONARDI), A., i, 551.
- $C_6H_5O_4N_6$, isomeric, from acetyl-methylnitric acid, and their derivatives (STEFFENS), A., i, 74.
- Substances**, $C_6H_5O_4N_2$, from the oxidation of α -mesityloxime (HARRIES), A., i, 504.
 $C_6H_5O_4N_2$, from trinitroanhydrodiacetonecarbamide (TRAUBE and LORENZ), A., i, 116.
 C_6H_5Br , from the action of bromine on camphonic acid (LAPWORTH and CHAPMAN), T., 466; P., 1900, 57.
 $C_6H_5O_2N$, from chloroform, alcoholic potash and α -benzylhydroxylamine (BIDDLE), A., i, 137.
 $C_6H_{11}I$, from iodoform and acetone (NEF), A., i, 2.
 $C_8H_{11}O_3N_7$, from chloroamino-4-methylpyrimidine and carbamide (GABRIEL and COLMAN), A., i, 56.
 $C_8H_{12}O_3$, from the action of hydriodic acid on acetylcedron (ČEČELSKY), A., i, 225.
 $C_8H_{14}ON_2$, from the oxidation of 4:4-dimethyl-5-isopropylpyrazoline (FRANKE), A., i, 212.
 $C_8H_{14}O_3N_2$, from the action of nitrous acid on β -hexahydro-*p*-benzylamine-carboxylic acid (EINHORN and LADISCH), A., i, 228.
 $C_9H_{10}OCl_2$, from the action of chloroform and alkali on 1:3:4-xylenol (AUWERS), A., i, 160.
 $C_9H_{15}O_3N_2Cl$, by the action of hydroxylamine and hydrogen chloride on hydroxymethylenetropinone (WILLSTÄTTER and IGLAUER), A., i, 244.
 $C_{10}H_8O_3N_8$, from 4-methylpyrimidine and fuming nitric acid (GABRIEL and COLMAN), A., i, 56.
 $C_{10}H_8O_3N_2$, from the oxidation of benzyldieneacetoxime (HARRIES), A., i, 504.
 $C_{10}H_{14}O_6N_2$, from α -dibromocamphor and nitric acid (LAPWORTH and CHAPMAN), T., 309; P., 1900, 4.
 $C_{10}H_{12}Br$, from tribromofenchane, zinc dust, and acetic acid (CZERNY), A., i, 676.
 $C_{10}H_{16}O_4$, from camphor, potassium persulphate and sulphuric acid (v. BAEYER and VILLIGER), A., i, 133.
 $C_{10}H_{18}O_4$ and $C_{10}H_{16}O_4$, from the condensation of glyoxal and isobutaldehyde (v. HORNOSTEL and SIEBEN), A., i, 206.
 $C_{10}H_{17}O_3N$, $C_{10}H_{15}ON_3$, and $C_{10}H_{15}O_2N_3$, from methyl propyl ketone, isomethyl nitrite, and hydrogen chloride (KISSER), A., i, 621.
 $C_{10}H_{23}O_2$, from isomethyl nitrite, isomethyl alcohol, and hydrogen chloride, and its oxidation products (KISSER), A., i, 620.

- Substance, $C_{10}H_{22}O_3$** , from carvomethyl bromide or chloride and silver oxide (KONDAKOFF and LUTSCHININ), A., i, 106.
- $C_{10}H_{22}O_3$, and $C_{12}H_{22}O_4$, from isobutyl nitrite, alcohol, and hydrogen chloride (KISSER), A., i, 621.
- $C_{11}H_{16}O_2$, obtained by the distillation of leaf fenchocarboxylate (WALLACH, NEUMANN, and v. WESTPHALEN), A., i, 241.
- $C_{12}H_{18}O_2I$, from iodophenylacetylene, silver acetate and glacial acetic acid (NEF), A., i, 22.
- $C_{12}H_{11}O_3$, from the empyreumatic oil of juniper (CATHELNEAU and HAUSER), A., i, 510.
- $C_{12}H_{13}O_4N_2S_3$, from bromine, carbon disulphide, and ethyl sodiocyanoacetate (WENZEL), A., i, 536.
- $C_{13}H_9O_3Br$, from the action of alcoholic potash on ethyl bromonaphthaquinonesacetate (LIEBERMANN), A., i, 311.
- $C_{13}H_{18}O_6$ (?), from the reduction of ethyl dimethylpyrinedicarboxylate (OLIVERI-TORTORICI), A., i, 552.
- $C_{14}H_{12}N_4$, from the decomposition of "cyanobenzidine" (MEVES), A., i, 484.
- $C_{14}H_{14}O_5N_2$, and $C_{14}H_{16}O_5N_2$, from the oxidation of hematoporphyrin (KÜSTER and KÖLLE), A., i, 69.
- $C_{14}H_{16}O_6N_3$, from semicarbazide and ethyl dimethylpyrinedicarboxylate (OLIVERI-TORTORICI), A., i, 552.
- $C_{14}H_{26}N_4S_3$, from formaldehyde, piperidine and dithio-oxamide (WALLACH), A., i, 211.
- $C_{15}H_{14}O_2N_2$, from thymoquinone and benzoylphenylhydrazine (MCIPHERSON), A., i, 124.
- $C_{16}H_{15}ON_2$, from α -benzaminocinnamide (ERLENMEYER), A., i, 549.
- $C_{16}H_{12}O_4$, from *Digitalis lutea* (ADRIAN and TRILLAT), A., i, 185.
- $C_{16}H_{22}O_6S_3$, from bromine, carbon disulphide, and ethyl sodiomalonate (WENZEL), A., i, 536.
- $C_{16}H_{20}O_4$, from the reduction of *p*-methylolbenzoic acid with sodium and amyl alcohol (EINHORN and LADISCH), A., i, 228.
- $C_{16}H_{20}N_4S_3$, from acetaldehyde, piperidine and dithio-oxamide (WALLACH), A., i, 211.
- $C_{17}H_{16}O$, from benzophenone (OECHSNER DE CONINCK and DERRIER), A., i, 502.
- $C_{17}H_{16}O_8$, from resorcinol and formaldehyde in presence of dilute mineral acids (GOLDSCHMIDT), A., i, 436.
- Substance, $C_{17}H_{20}O_5$** , from the action of alcoholic potash on acid, $C_{19}H_{18}O_9$ (GILBODY, PERKIN, and YATES), P., 1900, 107.
- $C_{18}H_{16}O_5N_2$, from *p*-aminobenzoic acid and ethyl acetoacetate in presence of pyridine (TROEGER), A., i, 227.
- $C_{18}H_{20}O_2N_2$, from *o*-phenylenediamine and camphoroxalic acid (J. B. and A. TINGLE), A., i, 302.
- $C_{18}H_{22}N_2S_2$, from formaldehyde, methylaniline and dithio-oxamide (WALLACH), A., i, 211.
- $C_{19}H_{18}O_4$, from the action of phenylhydrazine on trimethylbrazilone (GILBODY, PERKIN, and YATES), P., 1900, 105.
- $C_{19}H_{18}O_6N_2$, from the action of hydroxylamine hydrochloride on dipiperonalacetone (MINUNNI and CARTASATTA), A., i, 237.
- $C_{19}H_{18}O_2N$, and $C_{20}H_{20}O_3N$, from the condensation of benzyl cyanide and ethyl cinnamate (ERLENMEYER), A., i, 493.
- $C_{19}H_{16}O_7N$, from the oxime of *d*-usuic anhydride and sodium methoxide (WIDMAN), A., i, 235.
- $C_{19}H_{22}O_8$, from isolaricresinol (BAMBERGER and LANDSIEDL), A., i, 48.
- $C_{19}H_{30}O_5N_{11}$, by the action of nitrous acid on hexethylidenetetramine (KUDERNATSCHE), A., i, 337.
- $C_{20}H_{18}ON_3$, from the action of carbonyl chloride on anilindiphenylguanidine (SCHALL), A., i, 464.
- $C_{20}H_{24}N_2S_3$, from formaldehyde, methylaniline, and dimethyldithio-oxamide (WALLACH), A., i, 211.
- $C_{20}H_{26}N_2S_3$, from formaldehyde, ethylaniline, and dithio-oxamide (WALLACH), A., i, 211.
- $C_{20}H_{26}ON_3$, from the oxidation of methanementhylhydrazone (KJERNER), A., i, 278.
- $C_{21}H_{16}N_4$, from benzoic chloride and "cyananiline" (MEVES), A., i, 483.
- $C_{22}H_4O_8$, and $C_{22}H_{10}O_8$, from 1:4-dihydroxynaphthalene (RUSSIO), A., i, 601.
- $C_{22}H_{16}O_4$, from the oxidation of methoxynaphthol (RUSSIO), A., i, 602.
- $C_{22}H_{16}O$, from the hydrogen chloride additive product of benzylidenedibenzyl ketone and potassium hydroxide (GOLDSCHMIDT and KNÖPFER), A., i, 35.
- $C_{22}H_{18}O_2N_2$, from 3:5-diphenylisoxazoleoxime and phenylcarbimide (WISLICHENUS), A., i, 38.

- Substance**, $C_{22}H_{19}O_3N_3$, from ammonia, benzaldehyde, ethyl methylcyanoacetate and ethyl ethylcyanoacetate (GUARESCHI), A., i, 52.
- $C_{22}H_{20}N_4S_2$, from formaldehyde, ethyl-aniline, and dimethyldithio-oxamide (WALLACH), A., i, 211.
- $C_{22}H_{24}O_3N_{10}$, from a mixture of glycine and glycerol (BALBIANO and TRACIATTI), A., i, 632.
- $C_{22}H_{24}N_4S_2$, from valeraldehyde, piperidine and dithio-oxamide (WALLACH), A., i, 211.
- $C_{23}H_{14}O_2N_2$, from acetylmorphenol, chromic acid and *o*-tolylenediamine (VONGERICHTEN), A., i, 248.
- $C_{23}H_{19}ON$ from the action of formaldehyde on ethyl- β -naphthylamine hydrochloride in alcoholic solution (MORGAN), T., 819; P., 1900, 131.
- $C_{24}H_{24}N_4S_2$, from formaldehyde, methyl-aniline, and diethyldithio-oxamide (WALLACH), A., i, 211.
- $C_{24}H_{24}N_4S_2$, from benzaldehyde, diethylamine, and dithio-oxamide (WALLACH), A., i, 211.
- $C_{25}H_{24}N_4S_2$, from benzaldehyde, piperidine and dithio-oxamide (WALLACH), A., i, 211.
- $C_{26}H_{26}O$, from butylxylglyoxylic acid (BAUR-THURGAU and BISCHLER), A., i, 178.
- $C_{26}H_{28}O_6$, from the action of alkalis on strophanthidin (FEIST), A., i, 556.
- $C_{29}H_{20}O_9$, from *Pachyrhizus angulatus* (VAN SILLEVOLDT), A., i, 109.
- $C_{29}H_{26}O_3$, from dibenzyl ketone and benzaldehyde (GOLDSCHMIEDT and KNÖPPER), A., i, 36.
- $C_{30}H_{20}O_5$, $C_{48}H_{26}O_6$, $C_{60}H_{42}O_9$, $C_{60}H_{50}O_{13}$, from *p*-toluoyl-*o*-benzoic acid (LIMPRICHT and WIEGAND), A., i, 498.
- $C_{30}H_{24}ON_2$, by the action of potassium cyanide on benzyl cyanide and benzoin (SMITH), A., i, 39.
- $C_{30}H_{28}N_4S_2$, from benzaldehyde, methyl-aniline, and dithio-oxamide (WALLACH), A., i, 211.
- $C_{32}H_{31}O_2NCl_2$ from chlorodibenzyl methyl ketone (GOLDSCHMIEDT and KNÖPPER), A., i, 35.
- $C_{32}H_{34}N_4S_2$, from formaldehyde, dibenzylamine, and dithio-oxamide (WALLACH), A., i, 211.
- $C_{32}H_{36}O_2N_4$, obtained in the preparation of hematoporphyrin from hemin (KÜSTER and KÖLLE), A., i, 69.
- $C_{34}H_{30}O_2N_2$, from tolylbutanonic acid and phenylcarbimide (KLOBB), A., i, 405.
- Substance**, $C_{36}H_{28}N_2S_2$, from benzaldehyde, diamylamine, and dithio-oxamide (WALLACH), A., i, 211.
- $C_{44}H_{40}O_2N_2$, and $C_{50}H_{40}O_{11}N_4$, from benzylidene- β -naphthylamine and ethyl cetipate (THOMAS-MAMERT and WEIL), A., i, 427.
- $C_{45}H_{32}O_2N_2$, from the action of benzaldehyde on ethyl- β -naphthylamine (MORGAN), T., 1210; P., 1900, 171.
- Substances**, condition of, insoluble in water, formed in gelatin (DE BRUYN), A., ii, 136, 717.
- Substitution** in phenols, inhibiting effect of etherification on (ARMSTRONG and LEWIS), P., 1900, 157.
- Succinic acid** (*ethanedicarboxylic acid*), electrolytic oxidation of (CLARKE and SMITH), A., i, 77.
- estimation of, in fermented liquids (LABORDE and MOREAU), A., ii, 114.
- ethyl ester, condensation of, with cyclic ketones (STOBBE and FISCHER), A., i, 179.
- Succinic acid**, dicyano-, ethyl ester (THORPE and YOUNG), T., 937; P., 1900, 115.
- isoSuccinic acid**. See Methylmalonic acid.
- Succinic acids**, alkyl substituted, preparation and dissociation constants of (BONE and SPRANKLING), T., 654, 1298; P., 1900, 71, 184.
- and their amic acids and imides, melting points of (AUWERS, MAYEN, and SCHLEICHER), A., i, 84.
- Succinimide**, crystalline compounds of, with phenols (VAN BREUKELEVEEN), A., i, 343.
- Succinimides**, reduction of, to pyrrolidones (TAFEL and STERN), A., i, 557.
- Succinimino-ethers**, rearrangement of (WHEELER and BARNES), A., i, 294.
- Succinylsuccinic acid**, ethyl ester, hydrogenisation of (STOLLÉ), A., i, 234.
- Succitoyl ketone** (*ditolyl ethylene diketone*) (LIMPRICHT), A., i, 600.
- Sucrose** (*saccharose, cane sugar*), formation of, from dextrose in the cell (GRÜSS), A., ii, 361.
- distribution of, in plants (ANDERSEN), A., ii, 561.
- electrolysis of solutions of (ULSCH), A., i, 15.
- variation of the specific rotation of, with the temperature (SCHÖNROCK), A., i, 378.
- influence of pressure on the rotation of solutions of (SIERTSEMA), A., ii, 329.
- cryoscopic researches on (BATELLI and STEFANINI), A., ii, 709.

- Sucrose** (*saccharose, cane sugar*), viscosity of solutions of (HOSKING), A., ii, 336.
- stability of solutions of (OECHSNER DE CONINCK), A., i, 378.
- oxidation of, by hydrogen peroxide (MORRELL and CROFTS), T., 1220; P., 1900, 171.
- inverting power of citric, oxalic and tartaric acid on (GILLOT), A., i, 208.
- solubility of salts of calcium, iron, and copper in solutions of (STOLLE), A., i, 333.
- detection of, in lactose (LANDIN), A., ii, 514.
- detection of, in margarine (MECKE), A., ii, 319.
- estimation of, in beet (KOVÁK), A., ii, 694.
- estimation of, in condensed milk (GRÜNHUT and RIEBER), A., ii, 249.
- estimation of, in glycerin-soaps (FREYER), A., ii, 373.
- Sugar from curangin** (BOORSMA) A., i, 243.
- as food (STROHMER), A., ii, 490.
- formation of, in diabetes (ROSENQVIST), A., ii, 155.
- as an aid to the growth of plants (GOLDING), A., ii, 617.
- Sugar, invert**, from Finnish mossberry (STOLLE), A., ii, 614.
- estimation of, in presence of sucrose (JESSEN-HANSEN), A., ii, 113.
- Sugar-cane**. See Agricultural Chemistry.
- "Sugar-colours,"** colouring matters contained in, and their detection (SCHWEITZER), A., i, 277.
- Sugars** of some glucosides (VOTOČEK), A., i, 355.
- obtained by the hydrolysis of strophanthin and ψ -strophanthin (FEIST), A., i, 540, 555.
- in the liver (SEEGEN), A., ii, 29.
- relation between the diuretic coefficients, osmotic pressures, and molecular weights of (HEDON and ARROUS), A., ii, 94.
- effect of, on the velocity of hydrolysis of acids (COHEN), A., ii, 716.
- inversion of, by acids, influence of normal salts on (ARRHENIUS), A., ii, 201.
- cause of the diminution of the rate of inversion of raw (STOLLE), A., i, 277.
- determination of the inverting power of raw (JESSER), A., i, 276.
- absorption of, in the intestine (HEDON), A., ii, 223.
- source of error in the detection of, in urine, by means of Fehling's solution (EURY), A., ii, 249.
- Sugars**, detection of, in urine by phenylhydrazine (KOWARSKY), A., ii, 54.
- simplification of the phenylhydrazine test for, in urine (NEUMANN), A., ii, 248.
- effect of glycuronic acid on the phenylhydrazine test for, in urine (MAYER), A., ii, 320.
- estimation of, gravimetrically (CHAPPELLE), A., ii, 112, 629.
- estimation of, in fatty substances (POSSETTO), A., ii, 176.
- estimation of, in peat-meal molasses (WOY), A., ii, 682.
- estimation of, in diabetic urine (PATEIN and DUFAY), A., ii, 176; (TROGER and MEINE), A., ii, 635.
- estimation of, in urine (NEUBERG), A., i, 410; (PELLET), A., ii, 113.
- estimation of, polarimetrically, in wine (ROCQUES), A., ii, 695.
- reducing, estimation of, polarimetrically, in wines and lees (PELLET), A., ii, 113.
- separation and purification of (RUFF and OLLENDORFF), A., i, 77.
- Sulphatosised salts**, Fremy's (DIVERS and HAGA), T., 440; P., 1900, 55.
- Sulphine derivatives**, attempts to resolve (STRÖMHOLM), A., i, 327.
- p*-**Sulphobenzene-sodium phenylamine-sulphonic acid**, sodium salt (GNEHM and WERDENBERG), A., i, 94.
- p*-**Sulphocinnamic acid**, reduction of (MOORE), A., i, 550.
- Sulphohalite**, composition of (PENFIELD), A., ii, 550.
- Sulphonal** (*diethylsulphonedimethylmethane*; *isopropylidenediethylsulphone*), detection and isolation of (VITALI), A., ii, 774.
- amino-, and its derivatives and homologues (POSNER and FAHRENHORST), A., i, 16.
- Sulphonamides** of amines, behaviour of, to alkalis (SOLONINA), A., i, 147; (MARCKWALD), A., i, 149.
- 4-Sulpho-1:2-naphthaquinoxalinediacetic acid** and its ethyl ester (THOMAS-MAMERT and WEIL), A., i, 460.
- Sulphonaphthylstearic acid** (TWITCHELL), A., i, 296.
- Sulphonation** and methylation, simultaneous, of colouring matters (PRUD'HOMME), A., i, 455.
- Sulphones**. See:—
- Acetonediamyldisulphone.
 - Acetonediphenyldisulphone.
 - Benzenesulphocamphenamide.
 - Benzenesulphonamides.

- Tetronal.
- p*-Tolylthiosulphonacetooacetic acid.
- Trimethylenedisulphone.
- Trional.
- Sulphonic acids**, preparation of, by means of disulphides (BLANKSMA), A., i, 226, 482.
- Sulphonic group**, removal of, by reduction (MOORE), A., i, 550.
- Sulphophenylstearic acid** (*benzenestearosulphonic acid*) (TWITCHELL), A., i, 298.
- Sulphosalicylic acid**, esters of (COHN), A., i, 548.

- Sulphur**, amount of, in plants and soils (BOGDANOFF), A., ii, 160.
- molecular weight of (BLEIER and KOHN), A., ii, 203, 721; (ARONSTEIN and MEIHZUIZEN), A., ii, 341.
- vapour density of (BLEIER and KOHN), A., ii, 203, 721; (SCHALL), A., ii, 271.
- viscosity of, at temperatures above the point of maximum viscosity (MALUS), A., ii, 536.
- stereochemistry of (SMILES), T., 160, 1174; P., 1899, 240; 1900, 168; (POPE and PRACHEY), T., 1072; P., 1900, 12.
- excretion of, after extirpation of the liver (LANG), A., ii, 556.
- excretion of, by infants (FREUND), A., ii, 226.
- loosely combined, in urine (PETRY), A., ii, 675.
- Sulphur compounds** in Canadian petroleum (MAHERY), A., i, 533.
- chloride, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 75.
- action of arsenious and antimonous oxides, and of bismuth trioxide on (ODDO and SERRA), A., ii, 74.
- action of, on tungsten trioxide (SMITH and FLECK), A., ii, 81.
- Sulphuryl dichloride**, molecular weight of, in benzene (ODDO and SERRA), A., ii, 75.
- Thionyl chloride**, molecular weight of, in various solvents (ODDO and SERRA), A., ii, 75.
- action of, on dimethylaniline and on diethylaniline (MICHAELIS and SCHINDLER), A., i, 215.
- Sulphur perfluoride**, SF₆ (MOISSAN and LEBEAU), A., ii, 341, 342.
- Thionyl fluoride**, preparation, properties and analysis of (MOISSAN and LEBEAU), A., ii, 472.
- Sulphur hydride**. See Hydrogen sulphide.
- Sulphur dioxide** as a dissociative solvent (WALDEN), A., ii, 10.
- combination of, with oxygen (RUSSELL and SMITH), T., 340; P., 1900, 41.
- action of dry ammonia on (DIVERS and OGAWA), T., 327; P., 1900, 38; (DIVERS), P., 1900, 104.
- action of, on ammonia, and on fatty amines (SCHUMANN), A., ii, 271.
- action of iodides and hydriodic acid on (PÉCHARD), A., ii, 398; (BERG), A., ii, 535; (VOLHARD), A., ii, 650.
- estimation of (RUSSELL), T., 352; P., 1900, 41.

Sulphur dioxide, estimation of, in sulphites and thiosulphates (GRIFFIN), A., ii, 621.

Sulphur acids:—

Sulphuric acid, effect of concentration on the magnetic rotation of solutions of (FORCHHEIMER), A., ii, 524.

thermal capacity of solutions of (V. BIRON), A., ii, 63.

conductivity of aqueous solutions of hydrochloric acid and (BARNES), A., ii, 522.

migration constant of (KENDRICK), A., ii, 643.

surface-tension of mixtures of water and, and molecular mass of (LINEBARGER), A., ii, 273.

equilibrium between sulphates and, in aqueous solution (KAY), A., ii, 198.

relation between reactivity and concentration of (VAUBEL), A., ii, 650.

interaction of, with hydrogen peroxide (LOWRY and WEST), T., 950; P., 1900, 126.

action of, on potassium ferrocyanide (ADIE and BROWNING), T., 150; P., 1899, 226.

hydrates of (V. BIRON), A., ii, 74.

detection of, in presence of thiosulphates (DOBBIN), A., ii, 437.

test for selenium in (SCHLAGDENHAUFFEN and PAGEL), A., ii, 342.

estimation of, photometrically (HINDS), A., ii, 576.

estimation of, volumetrically (LITTERSCHID and FEIST), A., ii, 45.

estimation of, in presence of iron (WYROUBOFF), A., ii, 166; (KÜSTER and THIEL), A., ii, 242; (RICHARDS), A., ii, 472.

error in estimation of, in vegetable ashes (BOGDANOFF), A., ii, 160.

separation of, from vanadium (GOYDER), T., 1096.

Hyposulphurous acid (BERNTSEN and BAZLEN), A., ii, 203.

production of (NABL), A., ii, 13.

estimation of (FRADISS), A., ii, 44.

Sulphites and nitrites, interaction between (DIVERS and HAGA), T., 673; P., 1900, 70.

estimation of, in presence of thiosulphates (LUNGE and SEGALLER), A., ii, 366.

Persulphuric acids (LOWRY and WEST), T., 950; P., 1900, 126.

See also Caro's reagent.

Sulphur acids:—

Persulphates, action of, on iodine (MARSHALL), A., ii, 203.

estimation of (LE BLANC and ECKARDT), A., ii, 45.

Thiosulphuric acid, decomposition of (V. OETTINGEN), A., ii, 400; (HOLLEMAN), A., ii, 473.

estimation of, in presence of sulphites (LUNGE and SEGALLER), A., ii, 366.

Thiosulphates, action of, on iodates (JØRGENSEN), A., ii, 620.

Sulphur compounds, organic, critical temperatures of (FERRETTO), A., ii, 386.

Sulphur, estimation of:—

estimation of, in bitumens (S. F. and H. E. PECKHAM), A., ii, 44; (LANGMUIR), A., ii, 310.

estimation of, in iron (BLOUNT), A., ii, 574.

estimation of, in pig and cast iron (RIEMER), A., ii, 309.

estimation of, in pig iron (MOORE), A., ii, 106.

estimation of, in naphtha (LIDOFF), A., ii, 107.

estimation of, in ores, mattes, etc. (TRUCHOT), A., ii, 309.

estimation of, in organic substances (HENRIQUES), A., ii, 107.

estimation of, in petroleum (FRIEDLÄNDER), A., ii, 107.

estimation of, in pyrites (HEIDENREICH), A., ii, 310.

Sulphuric methylal. See Methylene sulphate.

Sulvanite from South Australia (GOYDER), T., 1094; P., 1900, 164.

Superfused substances, phenomenon noticed in the cooling of (MORESCHINI), A., ii, 465.

Superphosphates. See Agricultural Chemistry.

Suprarenal capsules, physiology of the (BORUTTAU), A., ii, 226; (MOORE and PURINTON), A., ii, 492.

aldehyde from the (JACOBY), A., i, 711.

extracts (MOORE and PURINTON), A., ii, 295.

influence of minimal doses of, on blood-pressure (MOORE and PURINTON), A., ii, 737.

gland, a depressor substance in the (HUNT), A., ii, 295.

Suprarenals, the catechol-like substance of the (V. FÜRTH), A., ii, 292.

Suprarenine (V. FÜRTH), A., ii, 292.

Surface layers of aqueous solutions, composition of (V. ZAWIDZKI), A., ii, 713.

Surface tension, conductivity and specific gravity of aqueous solutions containing potassium chloride and sulphate (BARNES), A., ii, 332.
 of organic liquids (DUTOIT and FRIDERICH), A., ii, 194.
 of solid bodies (OSTWALD), A., ii, 712.
 of mixtures of sulphuric acid and water (LINEBARGER), A., ii, 273.
Svanbergite (PRIOR), A., ii, 602.
Symphytoecynoglossine (GREIMER), A., i, 683.
Syrup, golden, analysis of (BODMER, LEONARD, and SMITH; MILLER and POTTS), A., ii, 320; (LEONARD; JONES), A., ii, 447; (MATTHEWS and PARKER), A., ii, 448.
 estimation of glucose syrup in (JONES), A., ii, 447.
 starch-, value of, in confections (KÖNIG), A., ii, 448.
Syrups, estimation of water in (MOLEND), A., ii, 309.

T.

Tacamahaca resin, examination of (DIETERICH), A., ii, 118.
Tachyhydrite, influence of pressure on the formation of (VAN'T HOFF and DAWSON), A., ii, 76.
ψ-Tagatose. See *l*-Sorbinose.
Tainiolite from Greenland (FLINK), A., ii, 411.
α-Tanacetogendicarboxylic acid (FROMM), A., i, 402.
Tanacetone (*thuyone*) and its derivatives (SEMMLER), A., i, 453.
 influence of active vegetable growth on the formation of (CHARABOT), A., ii, 362.
 formula of (SEMMLER), A., i, 240.
 conversion of, into carvotanacetone (SEMMLER), A., i, 676.
Tanacetone, pernitroso-, action of semicarbazide acetate on (RIMINI), A., i, 555.
Tanacetonedicarboxylic acid (SEMMLER), A., i, 453.
Tanacetyl alcohol (*thuyol*) (SEMMLER), A., i, 453.
 influence of active vegetable growth on the formation of (CHARABOT), A., ii, 362.
Tannic and gallic acids, estimation of (JEAN), A., ii, 632.
Tannin, estimation of (SPECHT and LORENZ), A., ii, 516.
Tanning materials, analysis of (PAESSLER), A., ii, 457.
Tannins of *Ardestaphylos Uva-ursi*, *Hematoxylon campechianum*, *Rhus Melopium*, *Myrica Gale*, *Coriaria Myrtifolia*, and *Robinia Pseudacacia* (PERKIN), T., 424; P., 1900, 45.
 of *Cortex Lokri* (VAN DEN DRIENEN-MARKEUW), A., ii, 102.
Tap cinder, estimation of iron in (BLUM), A., ii, 512.
Tar, Norwegian, composition of (STRÖM), A., i, 28, 577.
Tartar, crude, estimation of calcium malate in (ORDONNEAU), A., ii, 250.
Tartar emetics (BAUDRAN), A., i, 375; (PRUNIER), A., i, 376.
 See also Tartaric acid, potassium antimony salt of.
d-Tartaric acid, equilibrium between phenol, water and (SCHREINMAKERS), A., ii, 393.
 product of the destructive distillation of (SIMON), A., i, 624.
 colour test for (WOLFF), A., ii, 115.
d-Tartaric acid, beryllium alkali salts (ROSENHEIM and ITZIG), A., i, 185.
 cobalt and nickel salts, and double salts with potassium (TOWER), A., i, 587.
 copper alkali salts (BULLNHEIMER and SEITZ), A., i, 330.
 molybdo- and tungsto-alkali salts, specific rotatory power of (ROSENHEIM and ITZIG), A., i, 272.
 potassium antimony salt (*tartar emetic*), molecular weight of, by cryoscopic and boiling point methods (BATELLI and STEFANINI), A., ii, 709.
 action of sodium thiosulphate on (FAKTOR), A., ii, 598.
 potassium hydrogen salt, estimation of, in wine (MAGNIER DE LA SOURCE), A., ii, 768.
 potassium salts, metallic derivatives of. See also Tartar emetics.
d-Tartaric acid, ethyl ester, action of aniline and of hydroxylamine on (TINGLE), A., i, 544.
 action of ethyl iodide and sodium ethoxide on (BUCHER), A., i, 203.
 diethyl ester, preparation and rotation of acetyl and phenacetyl derivatives of (McCRAE and PATTERSON), T., 1096; P., 1900, 161.
l-Tartaric acid, copper alkali salts of (BULLNHEIMER and SEITZ), A., i, 330.
 Racemic acid, alkali double salts (SCHLOSSBERG), A., i, 376.
Tartromalic acids, α- and β- and their salts (ORDONNEAU), A., i, 203.

- Tartronic acid**, oxidation of, in presence of ferrous salts (FENTON and JONES), T., 71; P., 1899, 224.
- Taste of acid salts**, relation of, to their degree of dissociation (KAHLENBERG), A., ii, 270, 646; (RICHARDS), A., ii, 391.
- Tautomeric compounds**, optical behaviour of (BRÜHL), A., i, 497.
- Tautomerism**, spectrographic studies in (HARTLEY and DOBBIE), T., 498; P., 1900, 57; (HARTLEY, DOBBIE, and PALIATSEAS), T., 839; P., 1900, 130.
- Tea**, examination of (BRYTHIEN, BOHRISCH, and DEITER), A., ii, 455.
- Tellurium**, extraction and purification of (CRANE), A., ii, 473.
preparation of pure (NORRIS, FAY, and EDGERLY), A., ii, 272.
electrical resistance and specific gravity of (LENHER and MORGAN), A., ii, 273.
isomorphism of, with selenium (NORRIS and MOMMERS), A., ii, 537.
- Tellurium compounds**, physiological action of (GIES and MEAD), A., ii, 294.
- Telluriodates**, compounds of, with ammonium, potassium and rubidium (WEINLAND and PRAUSE), A., ii, 399.
- Tellurium nitrate**, basic, composition of (NORRIS, FAY, and EDGERLY), A., ii, 272.
dioxide, action of sodium thiosulphate on (NORRIS and FAY), A., ii, 272.
- Tellurous acid**, estimation of, in presence of haloid salts (GOOCH and PETERS), A., ii, 45.
- Tellurium organic compounds**:—
compounds of, with amines (LENHER), A., i, 379.
halogen salts, compounds of, with dimethylamine hydrochloride and hydrobromide (NORRIS and MOMMERS), A., ii, 537.
- Tellurium**, separation of, from selenium (CRANE), A., ii, 473; (KELLER), A., ii, 573.
- Telfairia oil and Telfairic acid** (THOMS), A., i, 473.
- Temperature**. See Thermochemistry.
- Tennantite**, identity of binnite with (PRIOR and SPENCER), A., ii, 21.
- Terephthalaldehyde tetracetate** (THIELE and WINTER), A., i, 501.
- Terephthalic acid**, bromo-, preparation and esterification of (WEGSCHEIDER and BITTNER), A., i, 658.
nitro-, preparation and esterification of, its salts, and the action of benzyl alcohol on it (WEGSCHEIDER), A., i, 657.
- Teresantalic acid** from East Indian sandalwood oil (GUERBER), A., i, 242; (MÜLLER), A., i, 678.
- $\Delta^{1,2}$ -Terpadiene**, 2-chloro-, and 2-chloro-bromo- (KLAGE and KRAITH), A., i, 43.
- $\Delta^{2(4,5)}$ -Terpadiene**, 3-chloro-, and chloro-tetrabromo-, from pulegone (KLAGE), A., i, 44.
- Terpene**, $C_{10}H_{16}$, from cascarilla oil, and its additive derivatives (THOMS), A., i, 622.
 $C_{10}H_{16}$, from oil of savin (FROMM), A., i, 402.
- Δ^1 -Terpene**. See Tetrahydrocymene.
- Terpenes**, genesis of, in lavender (CHARABOT), A., i, 241.
pseudo- and ortho-derivatives of (SEMMLER), A., i, 452.
- Terpenone**, $C_{10}H_{16}O$, constitution of (SEMMLER), A., i, 676.
- Terpin diformate** (BÉHAL), A., i, 581.
- Tetanus toxin**. See Toxin.
- Tetra-aniline antimonibromide** (HIGBEE), A., i, 285.
stanni-bromide and -chloride (RICHARDSON and ADAMS), A., i, 151.
- Tetra-aspartide** (SCHIFF), A., i, 279.
- Tetrabenzoyl**-. See under the Parent Substance.
- 2:2'-Tetrabenzoyldiamino-1:1'-dinaphthylmethane** (MORGAN), T., 814; P., 1900, 131.
- Tetracetoxytoluene** (THIELE and WINTER), A., i, 505.
- Tetracetoxy**-. See also under the Parent Substance.
- 2:2'-Tetraethyl-diamino-1:1'-dinaphthylmethane** (MORGAN), T., 814; P., 1900, 131.
- 1:2:3:4-Tetraethylbenzene**, refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.
- Tetraethylphosphonium compounds** (PARTHEIL), A., ii, 544.
- Tetraethylstibonium salts** (PARTHEIL and MANNHEIM), A., i, 479.
- Tetraethyltetrasulphone**, $\cdot CH_2[CH(SO_2Et)_2]_2$ and dibromo- (KÖRZ), A., i, 370.
- Tetrahedrite** (*faklore*), formula of (PRIOR and SPENCER), A., ii, 21.
- Tetrahydrobenzene**. See cycloHexene.
- Tetrahydrocarbazole**, transformations of (PLANCHER), A., i, 562.
- Tetrahydroapocinehenine** and its diacetyl derivative (KORNIOS), A., i, 246.
- Tetrahydrocymene** (Δ^1 -terpene), 2-chloro-, and 2-chlorobromo- (KLAGE and KRAITH), A., i, 43.

- Tetrahydrofurfuran-2:5-dicarboxylic acid**, its synthesis, hydrate and isomeric (LEAN), T., 105; P., 1899, 198.
- d-ac-Tetrahydro-β-naphthylamine*, racemisation occurring during the formation of benzylidene, benzoyl, and acetyl derivatives of (POPE and HARVEY), P., 1900, 74.
- Tetrahydroquinoline** and **Tetrahydroisoquinoline**, action of iodine on (SCHMIDT), A., i, 187.
- Tetrahydroquinolyl-2-propionic acid** and anhydride (KOENIGS), A., i, 250.
- Tetrahydrotoluene**, physical constants of, and compound of, with acetic chloride (KONDAKOFF and SCHINDLMEISER), A., i, 508.
- m-chloro-* (KLAGES), A., i, 44.
- Tetrahydroxyanthraquinone** and its acetyl derivatives (SLAMA), A., i, 181.
- Tetrahydroxyflavone**. See Luteolin.
- Tetrahydroxylic acid** (LRES and PERKIN), P., 1900, 20.
- Tetrahydroxytoluene** and its tetracetyl derivative (THIELE and WINTER), A., i, 505.
- 2:4:6:4'-Tetramethoxybenzoylacetophenone** (CZAJKOWSKI, V. KOSTANECKI, and TAMBOR), A., i, 504.
- Tetramethyldiaminobenzhydrol**, action of, on rosinduline and isorosinduline (MÜHLAU and SCHAPOSHNIKOFF), A., i, 367.
- Tetramethyldiaminobenzophenone**, action of, on *α*-dinaphthylbenzidine (MERZ and STRASSER), A., i, 314.
- Tetramethyldiaminobenzophenone-sulphone** (SACHS), A., i, 363.
- 2:2'-Tetramethyldiamino-1:1'-dinaphthylmethane** and **1:1'-Tetramethyldiaminodinaphthylmethane** (MORGAN), T., 823; P., 1900, 181.
- as-Tetramethyldiaminodiphenylethane* and its derivatives (TRILLAT), A., i, 252.
- action of nitrous acid on (TRILLAT), A., i, 192.
- Tetramethyldiaminodiphenylmethane**, preparation of (COHN), A., i, 608.
- Tetramethyldiaminodiphenylmethane-sulphone**, compound of, with nitroso-dimethylaniline (SACHS), A., i, 362.
- Tetramethyldiaminophenyl-carbinol** and **-methylcarbinol** (TRILLAT), A., i, 252.
- Tetramethylammonium cadmium haloids** (RAGLAND), A., i, 142.
- tin chlorides (COOK), A., i, 142.
- Tetramethylapionolearboxylic acid** (BIGNAMI and TESTONI), A., i, 400.
- α-Tetramethylbenzoic acid* (WEILER), A., i, 214.
- 1:3:4:6-Tetramethylecoumarone** (STOERMER), A., i, 653.
- Tetramethyl-decahydroacridinedione**, and **-octohydroxanthenedione** (VORLÄNDER and KALKOW), A., i, 99.
- s-Tetramethyldibenzyl*, synthesis of (WEILER), A., i, 213.
- Tetramethyldihydropyridone**, cyano-, action of heat on (GUARESCHI and GRANDE), A., i, 112.
- 4:6:6:8-Tetramethyl-6:7-dihydroquinocoumarin** (V. PECHMANN), A., i, 173; (V. PECHMANN and SCHWARZ), A., i, 174.
- Tetramethylenedicarboxylic acid**. See *cyclo*Butanedicarboxylic acid.
- Tetramethylene-1:3-disulphone**, dimethyl and diethyl derivatives of (KÖRTZ), A., i, 369.
- Tetramethylethyl-octohydro-xanthenedione** (VORLÄNDER and KALKOW), A., i, 100.
- s-Tetramethylglutaric acid* and its salts and anhydride (MICHAILENKO and JAVORSKY), A., i, 586.
- α,β-Tetramethylglutaric acids*, (*heptanedicarboxylic acids*) (THORPE), T., 932; (THORPE and YOUNG), T., 936; P., 1900, 114.
- Tetramethylhematoxylin**, oxidation of (PERKIN and YATES), P., 1900, 107.
- Tetramethylhematoxylone**, melting point of (GILBODY and PERKIN), P., 1899, 241.
- Tetramethylphosphonium compounds** (PARTHEIL), A., ii, 544.
- Tetramethylpyridone**, 3-cyano-1:2:3:4-, physiological action of (SABBATANI), A., ii, 94.
- Tetramethylpyrone** and its hydrate and salts (COLLIE and STEELE), T., 961; P., 1900, 146.
- periodide (COLLIE and STEELE), T., 1114; P., 1900, 164.
- Tetramethylpyrrolinocarboxylic acid**, amides of (PAULY and BOEHM), A., i, 357.
- Tetraphenylamine**, diamino-. See Dixerilamine, diamino-.
- Tetraphenyl-β-diketopiperazine** (HENZE), A., i, 119.
- Tetraphenylguanidine**, preparation of (V. BRAUN), A., i, 642.
- Tetraphenyl-*o*-phenylenediamine**, nitro- (HAUSSERMAN), A., i, 365.
- Tetraphenylpyrrolone** (KLOBB), A., i, 406.
- Tetrapropylstibonium salts** (PARTHEIL and MANNHEIM), A., i, 480.
- Tetra-*n*- and -*iso*-propyltetrasulphones**, $\text{CH}_3[\text{CH}(\text{SO}_2\text{Pr})_2]_2$ (KÖRTZ), A., i, 370.

Tetrasulphones, $\text{CH}_2[\text{CH}(\text{SO}_2\text{R})_2]$, reactivity of the hydrogen atoms in (KÖTZ), A., i, 369.

Tetrazine derivatives, conversion of, into triazole derivatives (HANTZSCH and SILBERRAD), A., i, 263; (BUSCH and HEINRICHS), A., i, 314.

Tetronal, chemico-toxicology of (VITALI), A., ii, 774.

Tetronic acid, chloro-, chlorobromo-, and iodo- (WOLFF and FERTIG), A., i, 585. nitro- and amino-, and their derivatives (WOLFF), A., i, 582; (WOLFF and LÜTTRINGHAUS), A., i, 583.

Tetronosulphonic acid (WOLFF and FERTIG), A., i, 586.

Thallium halogen salts, isomeric, and their constitution (CUSEMAN), A., ii, 725.

Thallium, tribromide, trichloride, and trinitrate (MEYER), A., ii, 655. trichloride, effect of oxidising agents on the reduction of, by oxalic acid (KASTLE and BEATTY), A., ii, 627.

compounds of, with organic bases (MEYER), A., ii, 655.

permanganate (MEYER and BEST), A., ii, 78.

nitrate, formation and transformation of the double salts of silver nitrate and (VAN EIJK), A., ii, 403.

persulphate (MARSHALL), A., ii, 277.

Thallie sulphate, hydrolysis of (MARSHALL), A., ii, 207.

Thallium, estimation of:—

estimation of (THOMAS), A., ii, 442.

estimation of, as chromate (BROWN-ING and HUTCHINS), A., ii, 172.

estimation of, as sulphate (BROWN-ING), A., ii, 247.

Thebaol, constitution of (PSCHORR), A., i, 234.

α - ψ -Thebaol (6-hydroxy-1:5-dimethoxy-phenanthrene), synthesis of (PSCHORR), A., i, 233.

α - ψ -Thebaolcarboxylic acid (6-hydroxy-1:5-dimethoxyphenanthrene-10-carboxylic acid) and its acetyl derivative (PSCHORR), A., i, 234.

Theobromine, decomposition of, in the organism (KRÜGER and SCHMIDT), A., ii, 31.

action of, on the heart (BOCK), A., ii, 424.

THERMOCHEMISTRY:—

Thermochemical law of maximum work (REYCHLER), A., ii, 258.

Thermodynamics and permanent change (DUHEM), A., ii, 524, 708. of normal cells (COHEN), A., ii, 520, 703.

THERMOCHEMISTRY:—

Thermokinetic properties of solutions (NATANSON), A., ii, 191.

Thermo-electrical properties of alloys (STEINMANN), A., ii, 523, 524.

Heat, absorption of, by the association of liquid molecules (VAN LAAR), A., ii, 189.

action of, on hydrogenised compounds (GUARESCHI and GRANDE), A., i, 112.

developed by starch by the absorption of water (RODEWALD and KATTEIN; RODEWALD), A., i, 477.

Thermal capacity of cobalt chloride solutions (WREWSKY), A., ii, 63.

of sulphuric acid solutions (v. BIRON), A., ii, 63.

centres of stability in compounds (MARTIN), A., ii, 589.

value of coefficients of acidity and influence (DE FORCRAND), A., ii, 527, 528.

of the hydroxyl function (DE FORCRAND), A., ii, 526.

Temperature, influence of, on the electrical conductivity of dilute amalgams (LAESEN), A., ii, 255.

of maximum density of solutions of ammonium chloride, lithium bromide and iodide (DE COPPET), A., ii, 529.

influence of, on the specific rotation of mono- and di-acetyl- and -phenacetyl-tartrates (McCRAE and PATTERSON), T., 1106.

of boiling mixtures of salts and steam (BUCHANAN), A., ii, 710.

of the body during fasting, and the speed of assimilation of carbohydrates, proteids and fats (Mosso), A., ii, 605.

Temperatures, fixed, tubular furnace giving (GAUTIER), A., ii, 258.

low, measurement of; boiling and melting points (LADENBURG and KRÜGEL), A., ii, 258.

very low, effect of, on the colour of bromine and iodine compounds (KASTLE), A., ii, 526.

Temperature coefficient of the driving tendency of physicochemical reaction (RICHARDS), A., ii, 533.

of conductivity of some liquid ammonia solutions (FRANKLIN and KRAUS), A., ii, 645.

of ester hydrolysis (PRICE), A., ii, 528.

Critical constants and temperature. See under Critical.

Transition temperatures, determination of (DAWSON and WILLIAMS), P., 1899, 210.

THERMOCHEMISTRY :—*Heat of formation* = *f.*; of *transformation* = *t.*; of *dissociation* = *dis.*; of *combustion* = *c.*; of *neutralisation* = *n.*; of *hydration* = *h.*; of *oxidation* = *o.*

Transition temperatures, new method of determining (COHEN), A., ii, 188.

of monotropic dimorphous substances, determination of the (SCHENCK), A., ii, 465.

of optical isomerides (ADRIANI), A., ii, 462.

of ammonium nitrate, change of, through the addition of potassium nitrate (MÜLLER), A., ii, 188.

of mercuric iodide (GERNEZ), A., ii, 141.

effect of various solvents on the (KASTLE and CLARK), A., ii, 141.

of mixed crystals of sodium and potassium nitrates and of sodium and silver nitrates (HISSINK), A., ii, 339.

of mixed crystals of potassium and thallium nitrates (VAN ELJK), A., ii, 133.

of hepta- and hexa-hydrates of zinc sulphate (BARNES), A., ii, 254.

Manostat (SMITS), A., ii, 388.

Thermocalorimeter, overflowing (MARSH), A., ii, 386.

Thermostats (BODENSTEIN), A., ii, 12.

Heat conductivity, change of, during melting (VAN AUBEL), A., ii, 128.

of gases (SMOLUCHOWSKI and V. SMOLAN), A., ii, 63.

of mixtures and of their constituents (LEES), A., ii, 338.

of nitrogen tetroxide (MAGNANINI and ZUNINO), A., ii, 525.

Atomic heats, additivity of (MEYER), A., ii, 464.

Specific heat and atomic weights (TILDEN), A., ii, 524.

of fluids (AMAGAT), A., ii, 525.

of alloys at low temperatures (BEHN), A., ii, 259.

of metals (TILDEN), A., ii, 524.

at low temperatures (BEHN), A., ii, 259.

of graphite at low temperatures (BEHN), A., ii, 259.

of nitriles and other organic compounds (LUGININ), A., ii, 334.

of cellulose, wool and leather (FLEURY), A., ii, 188.

of wheat starch (RODEWALD and KATTEIN), A., i, 477.

of blood (BORDIER; BERTHELOT), A., ii, 356.

Latent heat of fusion, effect of temperature or pressure on the (TAMMANN), A., ii, 714.

Heat of formation, supposed negative, of some carbon compounds (VAUBEL), A., ii, 274.

Heat of neutralisation of acids and bases and electrolytic dissociation (THIEL), A., ii, 260.

of acids, in alcohol, by ammonia and by potassium hydroxide (TANATAR and KLIMENKO), A., ii, 713.

Heat of vaporisation of air and of carbon dioxide (BEHN), A., ii, 260.

of nitriles and other organic compounds (LUGININ), A., ii, 334.

Thermochemical data of hyperacids (*n.* and *o.*) (PISSARJEWSKY), A., ii, 466.

of alloys (*f.*) (TAYLER; GLADSTONE), A., ii, 710.

of alloys of copper and zinc (*f.*) (BAKER), P., 1899, 195; (GALT), A., ii, 189.

of alkali hydroxides, and of ammonia and methylamine with hydrogen peroxide (*n.*) (DE FORCRAND), A., ii, 476.

of compounds of barium hydroxide and hydrogen peroxide (*f.* and *n.*) (DE FORCRAND), A., ii, 278.

of hydrated barium peroxide (*f.*) (DE FORCRAND), A., ii, 344.

of calcium peroxide (*f.*) (DE FORCRAND), A., ii, 526.

of hydrates of calcium peroxide (*f.*) (DE FORCRAND), A., ii, 401, 479.

of hydrogen fluoride (*dis.*) (ABEGG), A., ii, 190.

of hydrogen peroxide by basic hydroxides (*n.*) (DE FORCRAND), A., ii, 476.

of hydrogen peroxide by lime (*n.*) (DE FORCRAND), A., ii, 526.

of compounds of lithium bromide and gaseous ammonia (*f.*) (BONNEFOI), A., ii, 478.

of hydrated lithium peroxide (*f.*) of lithium peroxide (*f.*) (DE FORCRAND), A., ii, 478.

of sodium dioxide, hydrate of (*f.*) (DE FORCRAND), A., ii, 129.

of hydrated and anhydrous strontium dioxide (*f.*) (DE FORCRAND), A., ii, 344.

of tungsten (*o.*) (DELEPINE and HALLOPEAU), A., ii, 8; (DELEPINE), A., ii, 548.

of very volatile liquids (*c.* and *f.*) (BERTHELOT and DELEPINE), A., ii, 334.

of *n*-adipic acid (*f.* and *n.*) (MASSOL), A., ii, 260.

THERMOCHEMISTRY :—*Heat of formation* = *f.*; of *transformation* = *t.*; of *dissociation* = *dis.*; of *combustion* = *c.*; of *neutralisation* = *n.*; of *hydration* = *h.*; of *oxidation* = *o.*

Thermochemical data of ammonium cyanate (*f.* and *t.*) (WALKER and WOOD), T., 27; P., 1899, 209.
 of *cacodylic acid* (*n.*) (IMBERT), A., i, 145.
 of *carbonylhydroferrocyanic and hydroferrocyanic acids* (*n.*) (MULLER), A., ii, 130.
 of *diethylenediamine* (*c.*, *f.*, *h.*, and *n.*) (BERTHELOT), A., i, 83.
 of *gallic acid* (*n.*) (MASSOL), A., i, 499.
 of *hemipinic acid* (*c.* and *f.*) (LEROY), A., ii, 261.
 of *organic iodine compounds* (*c.* and *f.*) (BERTHELOT), A., ii, 387.
 of *salts of lactic acid and of lactide* (*c.*, *f.*, and *n.*) (BERTHELOT and DELÉPINE), A., ii, 130.
 of *lithium chloride compounds with ethylamine* (*f.*) (BONNEFOI), A., ii, 130.
 of *substituted malonic acids, compared with that of dibasic acids* (*n.*) (MASSOL), A., i, 200.
 of *meconin* (*c.*, *f.*, and *o.*) (LEROY), A., ii, 261.
 of *mercury-dimethyl, -diethyl, and -diphenyl* (*c.* and *f.*) (BERTHELOT), A., ii, 130.
 of *methylene sulphate* (*c.* and *f.*) (DELÉPINE), A., i, 130.
 of *narceine, its hydrates, hydrochloride and potassium derivative* (*c.*, *f.*, *h.*, and *n.*) (LEROY), A., ii, 131.
 of *opianic acid* (*c.*, *f.*, *n.*, and *o.*) (LEROY), A., ii, 261.
 of *protocatechuic acid* (*f.* and *n.*) (MASSOL), A., i, 600.
 of *thiocyanates and thiocarbimides* (*c.*, *f.*, and *t.*) (BERTHELOT), A., ii, 261.
 of *2:3:4-trihydroxybenzoic acid* (*n.*) of the *sodium salt* (*f.*) (MASSOL), A., i, 499.
 of the *uric acid series* (*c.* and *f.*) (BERTHELOT), A., ii, 189.
 of *violic acid and of water* (*dis.*) (ABEGG), A., ii, 190.
 of *marcasite and pyrites* (*c.*) (CAVAZZI), A., ii, 598.
 of *human fat* (*c.*) (BENEDICT and OSTERBERG), A., ii, 491.
Heat of solution, relation between solubility and, of electrolytes (VAN LAAR), A., ii, 708.
 of *salts, influence of the medium on* (GALITZKI), A., ii, 66.
 of *hydrogen peroxide* (DE FORCRAND), A., ii, 526.

Heat of solution of iron and steel (CAMPBELL), A., ii, 407.
 of *compounds of lithium bromide and gaseous ammonia* (BONNEFOI), A., ii, 478.
 of *lithium chloride compounds with ethylamine* (BONNEFOI), A., ii, 130.
 of *lithium peroxide and its hydrate* (DE FORCRAND), A., ii, 478.
 of the *hydrate of sodium dioxide* (DE FORCRAND), A., ii, 129.
 of *ammonium cyanate* (WALKER and WOOD), T., 27; P., 1899, 209.
 of *n-potassium adipate* (MASSOL), A., ii, 261.
 of *diethylenediamine* (BERTHELOT), A., i, 83.
 of *gallic acid* (MASSOL), A., i, 499.
 of *salts of lactic acid and of lactide* (BERTHELOT and DELÉPINE), A., ii, 130.
 of *opianic acid* (LEROY), A., ii, 261.
 of *protocatechuic acid* (MASSOL), A., i, 600.
 of *2:3:4-trihydroxybenzoic acid and its sodium salt* (MASSOL), A., i, 499.
Thetine, $C_6H_{11}O_2S$ (STRÖMHOLM), A., i, 326.
Thetine bromide, reactions of (STRÖMHOLM), A., i, 326.
 derivatives, attempts to resolve (STRÖMHOLM; VANZETTI), A., i, 327.
 resolution of (POPE and PEACHEY), T., 1072, P., 1900, 12.
Thiasine colouring matters, blue (SCHAFOSCHNIKOFF), A., i, 523.
 structure of (GREEN), A., i, 119.
Thioantimonites (POUGET), A., ii, 84.
Thiocarbamide, action of, on ethyl phenylpropiolate (RUHEMANN and STAPLETON), T., 242; P., 1900, 12.
 derivatives of *diacetoneamine* (TRAUBE and LORENZ), A., i, 115; (TRAUBE and SCHALL), A., i, 118.
Thiocarbamides, aromatic, convenient method for the preparation of (v. BRAUN), A., i, 644.
 action of *hydrazine* on (BUSCH and BAUER), A., i, 414.
 acyl derivatives of, isomerism and constitution of (HUGERSHOFF), A., i, 155.
Thiocarbimides from plants (GADAMER), A., i, 49; (TER MEULEN), A., i, 511.
 isomeric, thermochemistry of (BERTHELOT), A., ii, 261.

- Thiocarbonic acid**, diethyl ester, phenylhydrazone of (WHEELER and BARNES), A., i, 565.
- diThiocarbonic acid**, hydrazones of esters of (BUSCH and LINGENBRINK), A., i, 66, 411.
- Thiocyanic acid**, double salts of (MIOLATI; ROSENHEIM and COHN), A., i, 381.
- oxycobaltamine salts of (MASCETTI), A., i, 541.
- Thiocyanates**, double, electrical conductivity of (WALDEN), A., i, 430.
- isomeric, thermochemistry of (BERTHELOT), A., ii, 261.
- Thiocarbamic acid**, esters, acyl derivatives of (WHEELER and JOHNSON), A., i, 632.
- Thiols**. See Mercaptans.
- Thiocarbamic acid**, esters, action of chloroacetic acid on (WHEELER and BARNES), A., i, 565.
- acyl derivatives of, preparation and behaviour of, with alkyl iodides and amines (WHEELER and JOHNSON), A., i, 632.
- Thiocarbanilic acid**, esters, molecular rearrangement of, and action of chloroacetic acid on (WHEELER and BARNES), A., i, 565.
- Thionyl-methyl- and -ethyl-anilines** and their salts (MICHAELIS and SCHINDLER), A., i, 215.
- Thiosulfates**, preparation of (HEMPEL and V. HAASY), A., ii, 275.
- Thorium compounds**, rays from (CURIE), A., ii, 81; (P. and S. CURIE; P. and S. CURIE and BÉMONT), A., ii, 82.
- a radio-active substance from (RUTHERFORD), A., ii, 351, 352.
- Thorium salts** (ROSENHEIM and SCHILLING), A., ii, 351.
- Thorium chloride and bromide**, compounds of, with hydrogen chloride and pyridine (ROSENHEIM and SCHILLING), A., ii, 351.
- nitrate, purification of commercial (MUTHMANN and BAUR), A., ii, 597.
- double nitrates of quadrivalent (MEYER and JACOBY), A., ii, 597.
- oxide (*thoria*), luminosity of mixtures of ceria and (THIELE), A., ii, 208.
- Thujaketoneoxime**, bases from, and reactions of (WALLACH), A., i, 45.
- Thujamenthone and isoThujone**, formulæ of (SEMMLER), A., i, 240.
- Thujol**. See Tanacetyl alcohol.
- Thujone**. See Tanacetone.
- Thymic acid**, solubility of uric acid in (KOSSEL and GOTO), A., ii, 421; (GOTO), A., ii, 740.
- Thymin** (JONES), A., i, 319.
- preparation of (JONES), A., i, 572.
- dichloro-** (STEUDEL and KOSSEL), A., i, 467.
- Thymol**, sodium derivative of, compounds of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 394.
- 2:6-bromonitro- and -chloronitro- (KEHRMANN and SCHOEN), A., i, 181.
- Thymoquinonebenzoylphenylhydrazone** (McPHERSON), A., i, 124.
- Thymoquinoneoximes**, 3- and 6-bromo-, -chloro-, and -iodo- and their acyl derivatives (KEHRMANN and KRÜGER), A., i, 180.
- Thymoxyacetal** (STOERMER), A., i, 653.
- α -Thymoxy-propionic, -n- and -iso-butyric, and -isovaleric acids** and their ethyl esters (BISCHOFF), A., i, 394.
- Thymus and Thyroid glands**. See Gland.
- Tin**, enantiotropy of (COHEN and VAN EIJK), A., ii, 83, 212; (COHEN), A., ii, 212, 408.
- Tin compounds**, asymmetric optically active (POPE and PEACHER), P., 1900, 42, 116.
- analyses of (MENNICKÉ), A., ii, 668, 761.
- Tin alloys with antimony** (REINDERS), A., ii, 731.
- Tin chlorides and bromides**, compounds of, with anilines (RICHARDSON and ADAMS), A., i, 151.
- compounds of, with the methylamines and tetramethylammonium and the ethylamines (COOK), A., i, 142.
- Stannic chloride**, hydrolysis of (v. KOWALEWSKY), A., ii, 256; (KOHLRAUSCH), A., ii, 409.
- compound of, with nitrosyl chloride (VAN HETEREN), A., ii, 137.
- Stannous chloride**, use of, in Bettendorff's test for arsenic (DIETZ; ENELL; FREERICHs), A., ii, 244.
- Metastannic acid**, absorption of hydrogen and potassium chlorides from aqueous solution by (VAN BEMMELEN and KLOBBIE), A., ii, 338; (VAN BEMMELEN), A., ii, 466.
- Tin**, detection, estimation and separation of:—
- test for (ROGERS), A., ii, 445.
- detection of, by ammonium molybdate (LONGSTAFF), A., ii, 313.
- estimation of, in preserved meat, and the state in which it occurs (WIRTHELE), A., ii, 512.
- separation of, from antimony and arsenic (MARBURG), A., ii, 248.

- Tin ores** from Banca and Billiton (BECK), A., ii, 784.
- Tissues**, animal, different effect of ions on (LOEB), A., ii, 357.
- oxidation in (MEDVEDEFF), A., ii, 738.
- chemico-physical relations of juices and (ØKER-BLOM), A., ii, 290, 356, 607.
- connective, coagulable proteids of (GIES and RICHARDS), A., ii, 292.
- separation of, from muscle (GOODMAN), A., ii, 671.
- fibrous, hydrolysis of (ÉTARD), A., i, 468.
- white fibrous, glucoproteids of (GIES and CUTTER), A., ii, 293.
- nerve. See Nerves.
- estimation of alcohol in, in acute alcoholism (GRÉHANT), A., ii, 95, 112.
- estimation of urea in (GOTTLIEB), A., ii, 57.
- Titaniferous iron ores**, analysis of (BASKERVILLE), A., ii, 629.
- Titanium**, occurrence of, in flesh and bones (BASKERVILLE), A., ii, 226.
- tetrachloride, hydrolysis of (v. KOWALEWSKY), A., ii, 731.
- Titanium**, estimation of, in iron ores (BRAKES), A., ii, 248; (POPE), A., ii, 409.
- Tobacco**, chemistry of (KISSLING), A., ii, 640.
- New South Wales, amount and estimation of nicotine in (HARKER), A., ii, 778.
- See also Agricultural Chemistry.
- Tobacco smoke**, constituents of (THOMS), A., ii, 428.
- action of the carbonic oxide in, on the organism (WAHL), A., ii, 221.
- Tolane**, refraction of (CHILESOTTI), A., i, 339.
- crystalline form of (BOERIS), A., i, 544.
- p*-Tolonyliminomethyl ether, re-arrangement of (WHEELER and ATWATER), A., i, 294.
- Tolidine**, colour test for (WOLFF), A., ii, 119.
- Toluene**, refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.
- density of (v. HIRSCH), A., ii, 9.
- oxidation of (WEILER), A., i, 283.
- Toluene**, *o*- and *p*-chloro-, electrolytic preparation of (VOTOČEK and ZENÍŠEK), A., i, 19.
- 2:4:5-trichloro- (MORGAN), T., 1204.
- m*-chloro- *mono*- and -4:6-*di*-nitro-, and their reduction products (REVERDIN and CRÉPIEUX), A., i, 638.
- (*Toluene compounds Me=1.*)
- Toluene**, *p*-chloro-*o*-iodo-, and *p*-chloro-*o*-nitro- and the *iso*-compound (VAN RAALTE), A., i, 147.
- fluoro-, fluorochloro- and fluorochloro-nitro-derivatives of (SWARTS), A., i, 637.
- m*-iodoso- and its acetate (ORTOLEVA), A., i, 592.
- m*-iodoxy- (BAMBERGER and HILL), A., i, 281; (ORTOLEVA), A., i, 592.
- m*-nitro-, electrolytic reduction of (ROHDE), A., i, 20.
- p*-nitro-, action of sodium on (SCHMIDT), A., i, 20.
- o*-*is*onitro- (BAMBERGER), A., i, 500.
- Tolueneariminol**. See 1-Hydroxy-6-methyl-1:2:3-benzotriazole.
- p*-Toluenearazo-4-chloro-*m*-phenylenediamine (COHN and FISCHER), A., i, 458.
- o*-Toluenearazotolylcarbamie acid, ethyl ester (BUSCH and HARTMANN), A., i, 59.
- Toluenenitroic acid**, *d*initro-, salts of (HANTZSCH and KISSEL), A., i, 89.
- p*-Toluenesulphopropyl-amide and -*iso*-butylamide (MARCKWALD), A., i, 143.
- Toluenetricarboxylic acid** (DOEBNER), A., i, 500.
- o*-Toluidine, 5-chloro- (REVERDIN and CRÉPIEUX), A., i, 638.
- m*-Toluidine, 4:6-*dichloro*- (REVERDIN and CRÉPIEUX), A., i, 645.
- p*-Toluidine, compressibility of (HULETT), A., ii, 398.
- 3-chloro- (REVERDIN and CRÉPIEUX), A., i, 638.
- o*- or *p*-Toluidine, 5:4- or 3:6-chloro-nitro-, and its acetyl derivative (REVERDIN and CRÉPIEUX), A., i, 638.
- o*- and *p*-Toluidine hydrochlorides, double salts of, with bismuth chloride (HAUSER and VANINO), A., i, 641.
- Toluidines**, bromination of (FISCHER and WINDAUS), A., i, 485.
- antimonio-bromides, -chlorides, and -iodides of (HIGBEE), A., i, 285.
- "*o*-Toluidine, cyano-" and its acetyl derivative (MEVES), A., i, 483.
- o*-Toluidineosmellie acid (HEFFTER and FEUERSTEIN), A., i, 498.
- 5-Toluidine-4-*o*- and -*p*-tolyltriazoles, and the 3-methyl derivative of the para-compound (BUSCH and BAUER), A., i, 415.
- p*-Toluiline (*tri-p*-tolylglyoxaline) and its salts (PIEPES-PORATYŃSKI), A., i, 648.
- p*-Toluenitrile, polymerisation of (PIEPES-PORATYŃSKI), A., i, 648.
- p*-Toluoyl-*o*-benzoic acid, compounds from (LIMPRICHT and WIEGAND), A., i, 498.

(Tolyl compounds $Me=1$.)

- p*-Toluoyle-*p*-benzoic acid (LIMPRICHT), A., i, 598.
- p*-Toluoylearbinolbenzoic acid (LIMPRICHT), A., i, 598.
- p*-Toluoyle- β -propionic acid (LIMPRICHT), A., i, 600.
- Tolu-quinol and -quinone, tetrabromo- (AUWERS; AUWERS and HAMPE), A., i, 97.
- Toluquinone, tribromo- (AUWERS and V. ERGGELET; AUWERS and BURROWS), A., i, 98.
- pentabromo- (AUWERS and BURROWS), A., i, 98.
- Toluquinonebenzoylphenylhydrazine (MCPHERSON), A., i, 123.
- o*-Toluquinonehydrazones (FARMER and HANTZSCH), A., i, 123.
- Toluquinoneoxime ethers, space isomerism of (MORGAN), A., i, 103.
- Toluquinonephenylhydrazine (MCPHERSON), A., i, 123.
- Toluric acids, *o*- and *p*-, ethyl esters (RÜGHEIMER and FEHLHABER), A., i, 609.
- Toluroflavins, *o*- and *p*- (dimethylhipuroflavins) and their anilides, and toluidides (RÜGHEIMER and FEHLHABER), A., i, 609.
- p*-Tolylacetylene and α -chloro- (KUNCKELL and GOTSCH), A., i, 638.
- Tolyl acetyl nitrogen chlorides and bromides, *o*- and *p*- (acetyl-chloro- and -bromo-aminotoluenes) (CHATTAWAY and ORTON), T., 790; P., 1900, 102.
- 3-*p*-Tolylbenzoxazine, 6-nitro-, and its carbanilide (WERNER and HERBERGER), A., i, 58.
- p*-Tolylisobutyric acid (WALLACH), A., i, 229.
- p*-Tolylcarbasinic- α -carboxylic acid, esters of (BUSCH and LINGENBRINK), A., i, 413.
- Tolylguanides (BEUTEL), A., i, 367.
- m*-Tolylenediamine, difference of basicity of the amino-groups in (BÜLOW), A., i, 690.
- 2,4-Tolylenediamine, 5-chloro- and its acetyl derivatives (MORGAN), T., 1204; P., 1900, 170; (REVERDIN and CRÉPIEUX), A., i, 638.
- p*-Tolylethylene, $\alpha\beta$ -dichloro- (KUNCKELL and GOTSCH), A., i, 638.
- p*-Tolyl-*p*-hydroxybenzylidenemethylhydrazine (LABHARDT and V. ZEMBRZUSKI), A., i, 125.
- 3-Tolyl-4'-hydroxyphenylamine, 4:6-dinitro- (REVERDIN and CRÉPIEUX), A., i, 638.

(Tolyl compounds $Me=1$.)

- 3-Tolylimino-2-*p*-tolyl-7-methylphenotriazine and its salts and the dihydrotriazine (BUSCH and HARTMANN), A., i, 59.
- Tolylimino-*o*- and -*p*-tolyltetrazolones, *o*- and -*p*- (BUSCH and BAUER), A., i, 415.
- 2-Tolylketo-7-methyl-phenotriazine and -dihydrophenotriazine (BUSCH and HARTMANN), A., i, 59.
- m*- and -*p*-Tolyl mercaptans (BOURGOIS), A., i, 163.
- p*-Tolyl- α -methylhydrazine (LABHARDT and V. ZEMBRZUSKI), A., i, 125.
- 1-*p*-Tolyl-3-methylpyrazole and its halogen and nitro-derivatives and their salts (MICHAELIS and SUDENDORF), A., i, 696.
- 7-*o*-Tolyl-naphthaphenazonium, 7-chloro-, salts of (FISCHER and HEPP), A., i, 461.
- 3-Tolyl- α -naphthylamine, 4:6-dinitro- (REVERDIN and CRÉPIEUX), A., i, 638.
- p*-Tolyl-*o*-, -*m*-, and -*p*-nitrobenzylidenemethylhydrazine (LABHARDT and V. ZEMBRZUSKI), A., i, 125.
- Tolylloxides, sodium, compounds of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 392.
- Tolylloxacetones, *o*-, *m*-, and *p*-, and their oximes, phenylhydrazones, and semicarbazones (STOERMER), A., i, 651.
- β -*m*-Tolylloxycinnamic acid, and its ethylester (RUHEMANN and BEDDOW), T., 1119; P., 1900, 165.
- β -Tolylloxycinnamic acids, *o*- and *p*-, and their ethyl esters (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
- Tolylloxymaleic acids, *o*-, *m*-, and *p*-, and their ethyl esters (RUHEMANN and BEDDOW), T., 1124; P., 1900, 165.
- m*-Tolylloxymaleic acid (RUHEMANN and BEDDOW), T., 1125; P., 1900, 165.
- Tolyllox-propacetals, -propaldehydes and their oximes and semicarbazones, and -propionic acids, *o*-, *m*-, and -*p*- (STOERMER), A., i, 651.
- α -Tolyllox-propionic, -*n*- and -isobutyric, and -isovaleric acids, *o*-, *m*-, and *p*-, and their ethyl esters (BISCHOFF), A., i, 392.
- m*-Tolylloxystyrene (RUHEMANN and BEDDOW), T., 1119; P., 1900, 165.
- o*- and -*p*-Tolylloxystyrenes (RUHEMANN and BEDDOW), T., 984; P., 1900, 123.
- Tolylpyridazinone (LIMPRICHT), A., i, 600.
- p*-Tolylpyrrolidone (TAFEL and STERN), A., i, 558.

(*Tolyl compounds Me=1.*)

- 7-*o*-Tolyl-isorosindone**, and -rosindone and its oxime (FISCHER and HEPP), A., i, 461.
- p*-Tolylrosindulines**, and their salts (FISCHER and HEPP), A., i, 462.
- p*-Tolylaposafranine** and its salts (FISCHER and HEPP), A., i, 460.
- p*-Tolylthiocarbimide**, action of, on *o*-aminoazotoluene (BUSCH and HARTMANN), A., i, 59.
- o*-Tolylthionine** and its salts (SCHAPOSCHNIKOFF), A., i, 524.
- v*-Tolylthiosulphonacetacetic acid**, ethyl ester (TROEGER and EWERS), A., i, 495.
- Tolyltrimethylammonium iodides**, *o*-, *m*-, and *p*-, 5-, 6-, and 8-bromo- (FISCHER and WINDAUS), A., i, 484.
- p*-Tolyl-*as-m*-xylyliodonium hydroxide** and salts (WILLGERODT and HOWELLS), A., i, 338.
- Tolylxylylphthalide** (LIMPRICHT), A., i, 599.
- Tolypyrrine**, reactions of (HOFFMANN), A., ii, 379.
- Tomatoes**, detection of foreign colouring matters in preserved (HALPHEN), A., ii, 700.
- See also Agricultural Chemistry.
- Tonalite** from Cape Marsa (DUPARC and PEARCE), A., ii, 219.
- from the eruptive rocks from the Salzkammergut (V. JOHN), A., ii, 219.
- Topaz** from Japan (JIMBŪ), A., ii, 87.

- formation of, after splenectomy (MENDEL and JACKSON), A., ii, 607.
- deposits of, artificially produced in hens (SCHREIBER and ZAUDY), A., ii, 292.
- action of iodine solution and of permanganate on (JOLLES), A., ii, 322.
- solubility of, in nucleic and thymic acids (KOSSEL and GOTO), A., ii, 421; (GOTO), A., ii, 740.
- and its salts, behaviour and reactions of, in solution (HIS and PAUL), A., i, 591.
- salts of (TUNNICLIFFE and ROSENHEIM), A., i, 636.
- precipitation of, by barium chloride, from urine (JOLLES), A., ii, 696.
- estimation of, in blood and animal organs (HIS and HAGEN), A., ii, 769.
- estimation of, in urine (WÖRNER), A., ii, 251; (JOLLES), A., ii, 450; (BELLOCQ), A., ii, 695.
- Uric acid series**, thermal effect of oxidation and methylation in the (BERTHELOT), A., ii, 189.
- Urinary calculi**, composition of (SPIEGEL), A., ii, 422.
- secretion, influence of peptones and albumoses on (THOMPSON), A., ii, 226.

Urine, investigation of, by the freezing point and blood corpuscle method combined (HAMBURGER), A., ii, 421.
 cryoscopy of, in diagnosis and prognosis (CLAUDE and BALTHAZARD), A., ii, 154.
 relation of the reducing power of normal, to the amount of certain nitrogen compounds in (LONG), A., ii, 580.
 absorption of free oxygen by normal (BERTHELOT), A., ii, 740.
 oxidation of (COTTON), A., ii, 293.
 influence of caffeine on the output of alkalis in the (KATSUYAMA, KUWAHARA, and SENO), A., ii, 94.
 action of tannin on (GARNIER and MICHEL), A., ii, 58.
 glycolytic action of the (PIERALLINI), A., ii, 420.
 toxicity of (CHARRIN), A., ii, 559.
 of vegetarians, peculiarities in the (LONG), A., ii, 674.
 volume of, eliminated, dependent on quantity and concentration of sugars injected (HÉDON and ARROUS), A., ii, 94.
 acetone in (LÜTHJE), A., ii, 229.
 albumin in normal (BELLOCQ), A., ii, 556.
 occurrence of Bence-Jones albumin in (MAGNUS-LEVY), A., i, 615.
 in nephritis, alloxuric substances in (MARTIN), A., ii, 155.
 r-arabinose in (NEUBERG), A., i, 539.
 elimination of sodium cacodylate in, after ingestion (IMBERT and BADEL), A., ii, 293.
 excretion of calcium oxalate in (PIERALLINI), A., ii, 492.
 elimination of carbohydrates in (ROSENFELD), A., ii, 358.
 glycuronic acid in normal (MAYER), A., ii, 155; (MAYER and NEUBERG), A., ii, 421.
 hydroxybutyric acid in diabetic (MAGNUS-LEVY), A., ii, 155.
 indigotin in, after administration of oxalates (HARNACK and V. D. LEYEN), A., ii, 422.
 nitrogen, phosphates, and sulphates in, after ingestion of proteid food (SHERMAN and HAWK), A., ii, 421.
 oxaluric acid in (SALKOWSKI), A., ii, 635.
 isolation of pentose and methylpentose from (BERGELL and BLUMENTHAL), A., ii, 373.
 organic phosphorus compounds in infants (KELLER), A., ii, 293.
 loosely combined sulphur in (PETRY), A., ii, 675.

Urine, sulphur in, after extirpation of the liver (LANG), A., ii, 556.
Urine, analytical processes relating to:—
 diazo reactions of (BRIEGER), A., i, 316; (CLEMENS), A., ii, 227.
 preparation of Ehrlich's diazo-reagent (WESENBERG), A., ii, 776.
 detection of acetic acid and bilirubin in (ARNOLD), A., ii, 113.
 detection of acetone in (OFFENHEIMER), A., ii, 180.
 detection of acetoacetic acid in pathological (ARNOLD), A., ii, 768.
 detection of albumin in (MANKIEWICZ), A., ii, 459; (JOLLES), A., ii, 516.
 detection of albumoses in (v. ALDOR), A., ii, 123.
 biological detection of arsenic in (SCHOLTZ), A., ii, 244.
 detection of bile pigments in (HAMMARSTEN), A., ii, 637.
 detection of glycuronic acid in (MAYER), A., ii, 155.
 detection of indican in pathological (KLETT), A., ii, 776.
 detection of mercury in (HOEHNEL), A., ii, 368; (JOLLES), A., ii, 576.
 detection of phenetidine in (EDLEFSEN), A., ii, 378.
 source of error in the detection of sugar in, by means of Fehling's solution (EURY), A., ii, 249.
 detection of sugar in, by phenylhydrazine (KOWARSKY), A., ii, 54.
 simplification of the phenylhydrazine test for sugar in (NEUMANN), A., ii, 248.
 effect of glycuronic acid on the phenylhydrazine test for sugar in (MAYER), A., ii, 320.
 detection of nrobin in (ROMAN and DELLUC), A., ii, 700.
 detection of urochloralic acid in, after administration of chloral hydrate (VITALI), A., ii, 115.
 estimation of acetoacetic acid in (ARNOLD), A., ii, 768.
 estimation of acetone, acetoacetic and acetonedicarboxylic acids in (SABBATANI), A., ii, 32.
 estimation of the acidity of (BERTHELOT; NÄGELI), A., ii, 741.
 error in estimating albumin in (DE-ROIDE and OUI), A., ii, 123.
 estimation of allantoin in (LOEWI; PODUSCHKA), A., ii, 636.
 estimation of indican in (WANG), A., ii, 122; (BOUMA), A., ii, 700.
 estimation of mercury in (SCHUMACHER and JUNG), A., ii, 247; (JOLLES), A., ii, 576; (FARUP; WERDER), A., ii, 689.

Urine, analytical processes relating to:—

- clinical estimation of mercury in (ESCHRAUM), A., ii, 368.
- estimation of amino-acid nitrogen in (PFAUNDLER), A., ii, 674.
- estimation of oxalic acid in (SALKOWSKI), A., ii, 635.
- estimation of pentoses in (SULEYMAN BEY), A., ii, 446.
- estimation of the reducing power of (ROSIN), A., ii, 319; (SPIEGEL and PERITZ), A., ii, 457.
- estimation of reducing substances in, by Peške's method (GREGOR), A., ii, 94.
- estimation of sugars in (NEUBERG), A., i, 410; (PELLET), A., ii, 113.
- estimation of sugar in diabetic (PATEIN and DUFAY), A., ii, 176; (TROEGER and MEINE), A., ii, 635.
- estimation of urea in (JOLLES), A., ii, 515.
- estimation of uric acid in (WÖRNER), A., ii, 251; (JOLLES), A., ii, 450; (BELLOCQ), A., ii, 695.
- precipitation of uric acid from, by barium chloride (JOLLES), A., ii, 696.

Urinometer (BENOIT), A., ii, 435.

Urobilin, detection of, in urine (ROMAN and DELLUC), A., ii, 700.

Urochloralic acid, detection of, in urine after administration of chloral hydrate (VITALI), A., ii, 115.

Urotropine. See Hexamethylenetetramine.

Uranic acid (WIDMAN), A., i, 347.

constitution of (PATERNO), A., i, 662.
optical isomerides and oximes of (WIDMAN), A., i, 235.

Usonic acid (WIDMAN), A., i, 348.

Utensils, plated copper, estimation of silver on (GIRARD), A., ii, 170.

V.

Valencies, partial, theory of (KNOEVENAGEL; THIELE), A., ii, 534.

Valeraldehyde, physiological action of (ELFSTRAND), A., ii, 423.

Valeric acid, rotatory power of active (GUYE and ASTON), A., ii, 253.
separation of, from butyric and lactic acids (SCHNEIDER), A., ii, 177.

d-**Valeric acid** (*methyl-2-butyric acid*), methyl ester and amide of, and solubility of its silver salt (TAVERNE), A., i, 472.

iso-**Valeric acid**, α -thiocyano-, esters, formation and boiling points of (WHEELER and BARNES), A., i, 565.

Valeric acids (α - and β -*methylbutyric acids*), γ -cyano-, ethyl esters (HOWLES, THORPE, and UDALL), T., 947; P., 1900, 116.

γ -**Valerolactone**-*By-dicarboxylic acid* and its diethyl ester (BRETT and KERSHAW), A., i, 136.

Vanadium in plants (DEMARÇAY), A., ii, 235.

in rocks (VOGT), A., ii, 150.

spectrum of (HÄNNELBERG), A., ii, 381.

Vanadic oxide, preparation of pure, from iron ores (POPE), A., ii, 409.

Vanadiomolybdates and Silicovanadiomolybdates (FRIEDHEIM and CASTENDYCK), A., ii, 483.

Vanadium, estimation of, colorimetrically (MAILLARD), A., ii, 577.

estimation of, in iron ores (POPE), A., ii, 409.

separation of, from sulphuric acid (GOYDER), T., 1096.

Vanadium ores from West Colorado (HILLEBRAND and RANSOME), A., ii, 599.

Vanillin, presence of, in vanilla (BEHRENS), A., ii, 679.

in vinegar-essences (FROBENIUS), A., i, 603.

in wine vinegar (STOCKÝ), A., ii, 454.

formation of, in potato parings and its detection (BRÄUTIGAM), A., ii, 427.

action of nitric acid on (BENTLEY), A., i, 552.

estimation of (WELMANS), A., ii, 327; (HANUŠ), A., ii, 773.

Vanillin, *o*-nitro-, acetyl derivative and methyl ether of (PSCHORR and SUMULEANU), A., i, 178.

Vapour density of acetylacetone metallic salts (GACI), A., i, 276.

of bromine at high temperatures (PERMAN and ATKINSON), A., ii, 398.

of dried mercury and of dried mercurous chloride (BAKER), T., 646; P., 1900, 68.

of sulphur (BLEIER and KOHN), A., ii, 203, 721; (SCHALL), A., ii, 271.

See also Density.

Vapour pressure, theory of (GAHL), A., ii, 389.

diminution of, of dilute solutions (SMITS), A., ii, 708.

determination of, under arbitrary pressure (BLEIER and KOHN), A., ii, 192.

determination of the decrease in, by means of the determination of the increase in boiling point (SMITS), A., ii, 389.

Vapour pressure of the solvent (PONSOT), A., ii, 337.
 of mercury (HULETT), A., ii, 543.
 relations of mixtures of acetone and water (TAYLOR), A., ii, 529.
 of a series of benzene compounds (WORINGER), A., ii, 709.
 of camphor (ALLEN), T., 413; P., 1899, 135.
 of diisopropyl and diisobutyl (YOUNG and FORTEY), T., 1126; P., 1900, 165.
 of naphthalene (ALLEN), T., 400; P., 1899, 122.
 of *n*-octane (YOUNG), T., 1145; P., 1900, 166.
Vapour tension. See Vapour pressure.
Vegetables. See Agricultural Chemistry.
Velocity of chemical change. See Affinity.
Veratric acid, nitro- and amino-, constitution of (PSCHORR and SUMULEANU), A., i, 178.
Veratrine, action of chloroform or ether on (SCHAEER), A., ii, 455.
 action of, on muscle and nerve (WALLER), A., ii, 425.
Verberna, oil of, aldehydic constituents of (KERSCHBAUM), A., i, 353.
Verbenone (KERSCHBAUM), A., i, 353.
Vetoes. See Agricultural Chemistry.
Vicia seeds, hydrocyanic acid in (BRUYNING and VAN HAARST), A., ii, 160.
Vine. See Agricultural Chemistry.
Vinegar, fermentation, detection of aldehyde in (BÜTTINGER), A., ii, 778.
 wine, vanillin in (STOCKY), A., ii, 454.
 estimation of acetic acid in (DURIEU), A., ii, 322.
 See also Cider vinegar.
Vinegar-essences, vanillin in (FROBENIUS), A., i, 603.
Vinylacetic acid (FICHTER and KRAFFT), A., i, 8.
Vinylidene-oxanilide, -oxalotoluidides, and -oxaloxylylide (v. PECHMANN and ANSEL), A., i, 287, 389.
Vinyl nitrate, triiodo-. See Ethylene, triiodonitro-.
Vinylthioethylenethioglycollic acid and its salts (STRÖMHOLM), A., i, 13.
Violuric acid. See Barbituric acid, nitroso-.
Viscosity (*internal friction*) and electrolytic conductivity in saline solutions (MASSOULIER), A., ii, 331.
 and velocity of solidification of supercooled liquids (WILSON), A., ii, 712.
 of argon as affected by temperature (RAYLEIGH), A., ii, 590.

Viscosity (*internal friction*) of essential oils (DOWZARD), A., i, 676.
 of sulphur (MALUS), A., ii, 536.
 of water and solutions of sodium chloride, and of sucrose (HOSKING), A., ii, 336.
Vision, action of amyl nitrite and santonin on (FILEHNE), A., ii, 424.
Vitalism and asymmetry (ULPIANI and CONDELLI), A., ii, 463.
Vitellin, compounds of, in egg-yolk (OSBORNE and CAMPBELL), A., i, 616.
Vitexin, constitution of (PERKIN), T., 422; P., 1900, 45.
Vivianite from Moravia (KOVÁR), A., ii, 148.
Volume, atomic, and magnetic susceptibility of elements, connection between (MEYER), A., ii, 8.
 molecular, absolute (GULDBERG), A., ii, 264; (BERTHELOT), A., ii, 335.
 of camphor derivatives (HALLER and MÜLLER), A., ii, 193.
 specific, of diisopropyl and diisobutyl (YOUNG and FORTEY), T., 1126; P., 1900, 165.
 of *n*-octane (YOUNG), T., 1145; P., 1900, 166.
Von-Diestite from Colorado (CUMENGE), A., ii, 660.

W.

Wallflower, active constituents of (KEEB), A., i, 186.
WATER:—
 spectrum of the vapour of (TROWBRIDGE), A., ii, 701.
 conductivity of, distilled in air (WALKER and CORMACK), T., 11.
 heat of dissociation of (ABEGG), A., ii, 190.
 vapour pressure relations of acetone and (TAYLOR), A., ii, 529.
 minimum in the molecular lowering of the freezing point of, produced by acids and salts (CHAMBERS and FRAZER), A., ii, 526.
 freezing point curve for, containing hydrogen chloride and phenol (EMERY and CAMERON), A., ii, 335.
 freezing point of mixtures of acetic acid and (DE COPPET), A., ii, 65.
 compressibility of (HULETT), A., ii, 398.
 viscosity of (HOSKING), A., ii, 336.
 equilibrium between acetone, phenol and (SCHREINEMAKERS), A., ii, 393.
 equilibrium between alcohol, an alkali salt and (DE BRUYN), A., ii, 266.

WATER:—

equilibrium between alcohol, gelatin and; and agar and (HARDY), A., ii, 396.

equilibrium between aniline, phenol and (SCHREINEMAKERS), A., ii, 135.

equilibrium between hydrochloric acid, phenol and (KRUG and CAMERON), A., ii, 393.

equilibrium between phenol, *d*-tartaric or racemic acid, and (SCHREINEMAKERS), A., ii, 393.

absorption and emission of the vapour of, by colloids (DUHEM), A., ii, 338.

decomposition of, by fluorine (MOISSAN), A., ii, 13.

action of metallic magnesium on (BRYANT), A., ii, 278.

reactions in (ROHLAND), A., ii, 468.

Water of crystallisation (SALZER), A., ii, 270.

nature of (RINKE), A., ii, 202.

in the barium and calcium salts of γ -methylvaleric acid (ORNSTEIN), A., i, 7.

NATURAL WATER:—

purification of (TIXIER), A., ii, 71.

apparatus for the distillation of (MAREK), A., ii, 202.

Rain-water collected at Cirencester, amount of chlorine in (KINCH), T., 1271; P., 1900, 183.

Glacial waters from Norway (HOLLAND and DICKSON), A., ii, 151.

Lake water of the Salt Lake of Urmia, Persia (GÜNTHER and MANLEY), A., ii, 220.

Spring and mineral waters of Australasia (LIVERSIDGE, SKEY, and GREY), A., ii, 288.

hot sulphur, from Deutsch-Altenburg (LUDWIG and PANZER), A., ii, 90.

from the Cold or "Park" spring at Evaux-les-Bains (BONJEAN), A., ii, 488.

French, composition of (CARNOT), A., ii, 552.

from Graubünden, Switzerland (NUSSBERGER), A., ii, 90.

from Jouhe, near Dôle, Jura (BOURCET), A., ii, 355.

from Lutraki, Greece (DAMBERGIS), A., ii, 90.

of Monsummano (ALBERTONI and CORONEDI), A., ii, 90.

of Mont-Dore, gases from the (PARMENTIER and HURION), A., ii, 415.

from the Brault No. 3 spring at Sail-sous-Couzan (BONJEAN), A., ii, 488.

NATURAL WATER:—

Spring and mineral waters of Salsomaggiore (NASINI and ANDERLINI), A., ii, 489.

combustible gases from the (NASINI and SALVADORI), A., ii, 415.

of Spain and Portugal, fluorine in (FERREIRA DA SILVA and D'AGUIAR), A., ii, 28.

apparatus for the estimation of carbon dioxide in (HELD), A., ii, 169.

estimation of silica in, colorimetrically (SALVADORI and PELLINI), A., ii, 367.

Sea water, composition of, and evaporation of, at 25° (VAN'T HOFF and MEYERHOFFER), A., ii, 23.

influence of temperature and pressure on the evaporation of (VAN'T HOFF and DAWSON), A., ii, 76.

calcium carbonate in (COHEN and RAKEN), A., ii, 725.

poisonous action of, on plants (COUPIN), A., ii, 236.

examination of, optically (MANLEY), A., ii, 619.

estimation of dissolved oxygen in (LETTS and BLAKE), A., ii, 755.

Well waters, connection between chlorides, nitrates and sulphates in (KÖNIG), A., ii, 438.

impure, cystin and tyrosine in (CAUSSE), A., ii, 457, 458.

Water analysis:—

detection of nitric acid in (UTZ), A., ii, 438.

detection of nitrous acid in (ERDMANN), A., ii, 243; (SPIEGEL), A., ii, 318; (MENNICKE), A., ii, 438, 621; (SCHAER), A., ii, 438.

estimation of ammonia and nitrogen in, apparatus for (WESTON), A., ii, 685.

estimation of the hardness of (VENTUROLI), A., ii, 579.

estimation of nitric acid in (HÖNIG), A., ii, 242.

estimation of nitrous acid in (ROMIJN), A., ii, 510.

estimation of dissolved oxygen in (MUTSCHLER), A., ii, 106; (ZETSCHKE), A., ii, 166; (LETTS and BLAKE), A., ii, 755.

Wax of Bacillariaceæ (KRAEMER and SPILKER), A., i, 73.

bees', detection and estimation of impurities in (FUNARO), A., ii, 55.

Japan, constituents of (GEITEL and VAN DER WANT), A., i, 271.

(*o*-Xylene, *Me:Me*=1:2; *m*-xylene, *Me:Me*=1:3; *p*-xylene, *Me:Me*=1:4.)

Waxes, acetyl value of (LEWKOWITSCH), A., ii, 323.

Weight, molecular, by the boiling point method, apparatus for determining (McCoy), A., ii, 387.

drop methods for the determination of (ROSSET), A., ii, 336.

of gases, determination of, from their density (VAN DER WAALS), A., ii, 134.

of liquids and van't Hoff's equation (SPEYERS), A., ii, 10.

of iodine and its *mono*- and *tri*-chlorides and of phosphorus *pentachloride*, in various solvents (ODDO and SERRA), A., ii, 73.

of ozone (LADENBURG), A., ii, 721.

of phosphoryl bromides and chlorides, of sulphur chlorides, and of chromyl dichloride in various solvents (ODDO and SERRA), A., ii, 75.

of sulphur (BLEIER and KOHN), A., ii, 203, 721; (ARONSTEIN and MEIHZEN), A., ii, 341.

of the aldols (KOHN), A., i, 274.

of starch (RODEWALD and KATTEIN), A., i, 477.

Weights, method of testing (RICHARDS), A., ii, 534.

"**Weissmetall**," analysis of (NISSENSON), A., ii, 108.

Westanite from Westanå, Sweden (WEIBULL), A., ii, 286.

Wheat, oil from (FRANKFORTER and HARDING), A., ii, 37.

See also *Agricultural Chemistry*.

Willow bark, new glucoside from (JOWETT), T., 707; P., 1900, 89.

Wines, chemistry and analysis of (RIPPER), A., ii, 319.

marc, recognition of (FRESENIUS and GRÜNHUT), A., ii, 52.

addition of phenolphthalein to (V. VÁMOSSY), A., ii, 876.

detection of fluorine in (PARIS), A., ii, 572.

detection of "saccharin" in (VITALI), A., ii, 57.

cause of error in testing for salicylic acid in (FERREIRA DA SILVA), A., ii, 695.

estimation of potassium hydrogen tartrate in (MAGNIER DE LA SOURCE), A., ii, 768.

estimation of sugars in, polarimetrically (PELLET), A., ii, 113; (ROCQUES), A., ii, 695.

Wood (*Isatis tinctoria*), formation of indigotin from (BEYERINCK), A., i, 230, 480, 649.

Wool, specific heat of (FLEURY), A., ii, 188.

Wool fat, analysis of (BORNTRÄGER), A., ii, 773.

Work, muscular, influence of alcohol on (SCHEFFER), A., ii, 418.

X.

Xanthic acid, potassium salt, preparation of, for nickel estimations (CAMPBELL), A., ii, 577.

Xanthine, new synthesis of (TRAUBE), A., i, 416.

Xanthine bases in feces (PARKER), A., ii, 556.

Paraxanthine, decomposition of, in the organism (KNUßER and SCHMIDT), A., ii, 31.

Xanthone, *mono*- and *di*-thio- (MEYER; MEYER and SZANECKI), A., i, 660.

Xantho-rhamnin and **-rhamnein** (C. and G. TANRET), A., i, 185.

Xylenes, *o*-, *m*-, and *p*-, refraction and magnetic rotation of (PERKIN), T., 267; P., 1899, 237.

density of (v. HIRSCH), A., ii, 9.

***o*-Xylene**, *ω*-, *di*bromo-, action of triethylphosphine on (PARTHEIL and GRONOVER), A., i, 368.

3-iodo- (KLAGES and LIECKE), A., i, 387.

***m*-Xylene**, *as*-iodoso-, *as*-iodoxy-, and *as*-iodonium-compounds of (WILLGERODT and HOWELLS), A., i, 338.

***m*- and *p*-Xylenes**, 2-iodo- (KLAGES and LIECKE), A., i, 387.

***as*-*m*-Xylene** *as*-4-chloro-*m*-phenylene-diamine (COHN and FISCHER), A., i, 458.

Xylenenitroic acid, dinitro-, salts of (HANTZSCH and KISSEL), A., i, 90.

1:2:4-Xylenol, *ω*:2:5:6- and *ω*:3:5:6-tetra-, *ω*:3:5:6-penta-bromo-, and tri-bromo-*ω*-, *di*iodo-, acetyl derivatives; and ethers of (AUWERS), A., i, 96; (AUWERS and v. ERGGELET), A., i, 97. *ω*:*ω*:*ω*:3:4:6-hepta-bromo-, and its acetyl derivatives and ethers (AUWERS), A., i, 96; (AUWERS and BURROWS), A., i, 98.

1:3:4-Xylenol, action of chloroform and alkalis on (AUWERS), A., i, 160.

ω:2:5:6-penta-bromo-, acetyl derivatives of, and their reactions; and 2:5:6-tri-bromo-*ω*-, *di*iodo- (AUWERS; AUWERS and HAMPE), A., i, 96.

methyl ether (AUWERS; AUWERS and HAMPE), A., i, 96.

1:4:3-Xylenol, tri-bromo- (AUWERS and ANSELMINO), A., i, 160.

ω:2:5:6-tetra-bromo- (AUWERS and ANSELMINO), A., i, 160; (AUWERS and BROICHER), A., i, 162.

(*o*-Xylene, *Me:Me*=1:2; *m*-xylene, *Me:Me*=1:3; *p*-xylene, *Me:Me*=1:4.)

- 1:4:5-Xylenol**, ω :2:3:6-pentabromo-, and its acetyl derivative (AUWERS and ANSELMINO), A., i, 160.
- Xylenols**, bromo-derivatives, oxidation products of (AUWERS), A., i, 161; (AUWERS, BROICHER, and WOLFF), A., i, 162.
- Xylenoxy-acetal and -aldehyde hydrate** and its oxime and semicarbazone, *o*- and *m*- (STOERMER), A., i, 652.
- Xylenoxyacetones**, *o*-, *as-m*-, and *p*-, and their oximes (STOERMER), A., i, 652.
- Xylidines**, bromination of, and their acetyl derivatives (FISCHER and WINDAUS), A., i, 484.
isomeric, separation of, from commercial xylidine (HODGKINSON and LIMPACH), T., 65; P., 1899, 202.
- Xyloic lactone** (CLOWES and TOLLENS), A., i, 205.
- Xylose** from tragacanth (WIDTSOR and TOLLENS), A., i, 207.
fermentation of (SALKOWSKI), A., i, 628.
synthesis of *l*-erythritol from (MAQUENNE), A., i, 472.
- l*-Xylose**, phenylbenzylhydrazone of (RUFF and OLLENDORFF), A., i, 77.
- d*- and *l*-Xylose**, from gulonic acid (FISCHER and RUFF), A., i, 539.
- Xylosoxime** (MAQUENNE), A., i, 424, 472.
- m*-Xylylamine** and its derivatives (SOMMER), A., i, 388.
- m*-Xylylcarbamie acid**, ethyl ester, and ***m*-Xylylcarbimide**, and their 5- and 6-nitro-derivatives (VITTENET), A., i, 154.
- p*-Xylylchloroacetylene** (KUNCKELL and GOTSCH), A., i, 639.
- o*-Xylenebisatriethylphosphine** and its salts (PARTHEIL and GRONOVER), A., i, 368.
- m*-Xylylene dibromide** and bromobenzene, action of sodium on a mixture of (PRILEGRIN), A., i, 151.
- Xylylene hydrosulphides**, *o*-, *m*-, and *p*- (KÖTZ), A., i, 343.
- Xylylenemethylenemercaptals**, *o*-, *m*-, and *p*- (KÖTZ), A., i, 343.
- Xylyloxides**, sodium, compounds of, with the ethyl esters of α -bromo-fatty acids (BISCHOFF), A., i, 393.
- α -Xylyloxy-propionic**, ***n*-** and ***iso*-butyric**, and ***isovaleric* acids**, *o*-, *m*-, and *p*-, and their ethyl esters (BISCHOFF), A., i, 393.
- o*-Xylyl-phthaloylic acid** and **-phthalide** (LIMPRICHT), A., i, 599.
- m*-Xylyl-*p*-toluidine**, *o*- and *p*-amino- (COHN and FISCHER), A., i, 690.
- Xylol-2- and -4-trimethylammonium iodides**, *p*- and *m*-, 5- and 6-bromo- (FISCHER and WINDAUS), A., i, 484.

Y.

- Yeast** (BÖTTINGER), A., ii, 33.
reproduction of, without fermentation (ROSENSTIEHL), A., ii, 229.
fermentation of (LINTNER), A., ii, 296.
chemical fermentation by, in an antiseptic medium (DE REY-PAILHADE), A., ii, 678.
formation of enzymes characteristic of (KLÖCKER), A., ii, 743.
physiology of (DUCLAUX), A., ii, 678.
estimation of starch in (BRUYLANTS and DRUYTS), A., ii, 113; (CRISPO), A., ii, 176.
- "Yeast, Chinese,"** and ***Mucor Rouzii*** (WEHMER), A., ii, 743.
- Yeasts**, effect of mineral and nitrogenous nutritive matters on (KUSSEHOW), A., ii, 33.
of "sake" (KOZAI), A., ii, 743.
- Yeast extract** (ALBERT and BUCHNER), A., i, 320, 420.
Buchner's (WRÓBLEWSKI), A., ii, 157.
concentrated (AHRENS), A., ii, 610.
precipitation of (ALBERT and BUCHNER), A., i, 420.
precipitation of zymase from (ALBERT and BUCHNER), A., i, 320.
- Yttrium**, atomic weight of (MUTHMANN and BÖHM), A., ii, 209.
specific gravity of (MEYER), A., ii, 143.
microchemical researches on erbium, didymium and (POZZI-ESCOT and COUQUET), A., ii, 404.
oxide (*yttria*), preparation of pure (MUTHMANN and BÖHM), A., ii, 209.

Z.

- Zinc**, boiling point of (BERTHELOT), A., ii, 654.
solution tension of, in ethyl alcohol (JONES and SMITH), A., ii, 467.
equilibrium between lead and, and mixtures of their fused chlorides (REINDERS), A., ii, 715.
- Zinc alloys** with copper, heat of combination of (BAKER), P., 1899, 195; (GALT), A., ii, 189.
action of, on nitric acid (GLADSTONE), A., ii, 710.
with platinum (HODGKINSON, WARING, and DESBOROUGH), A., ii, 282.
- Zinc borate** (OUVRARD), A., ii, 207.
fluoride, double salts with aluminium or ferric fluoride (WEINLAND and KÖPPEN), A., ii, 143.

Zinc hydroxide, solubility of (HERZ), A., ii, 338.
 equilibrium in the partition of an acid between ammonia and (HERZ), A., ii, 337.
 oxide, behaviour of, at high temperatures (SCHÜPPHAUS), A., ii, 207.
 ammonium phosphate, estimation of zinc in (AUSTIN), A., ii, 49.
 double selenates, crystallography of (TUTTON), A., ii, 593.
 selenide, dimorphism of (FONZES-DIACON), A., ii, 345.
 sulphate, combination of, with ammonia in aqueous solution (DAWSON and McCRAE), T., 1245; P., 1900, 173.
 hydrates of, solubility of (COHEN), A., ii, 184.
 hydroximidosulphate, production of (DRIVERS and HAGA), T., 690; P., 1900, 71.
 potassium sulphate (MALLET), T., 220; P., 1899, 227.
 thioantimonite and its double salt with potassium (POUGET), A., ii, 84.
Zinc organic compounds:—
 alkyls, action of, on alkyl nitrites and on nitroparaffins (BEWAD), A., i, 629.
 ethyl, preparation of (LACHMAN), A., i, 542.
Zinc, estimation of:—
 analysis of, for cadmium and lead (MACKAY), A., ii, 49.

Zinc, estimation of:—
 titration of, with potassium ferrocyanide (MILLER and HALL), A., ii, 688.
 estimation of, volumetrically (MEADE), A., ii, 575.
 estimation of, electrolytically, in presence of manganese (RIEDERER), A., ii, 49.
 estimation of, by solution in hydrochloric acid (BALDY), A., ii, 690.
 estimation of, as phosphate (DAKIN), A., ii, 624.
 estimation of, gravimetrically, as sulphate (EUIER), A., ii, 760.
 technical estimation of, in ores (LOW), A., ii, 441.
 estimation of, in organic substances (LEHMANN), A., ii, 170.
 estimation of, in zinc ammonium phosphate (AUSTIN), A., ii, 49.
Zinc-schefferrite from Franklin furnace, New Jersey (WOLFF), A., ii, 735.
Zingiberene from oil of ginger (v. SODEN and ROJAHN), A., i, 605.
Zinnwaldite (?) from Japan (JIMBÔ), A., ii, 87.
Zirconium, specific gravity of (MEYER), A., ii, 143.
 separation of, from iron (HAVENS and WAY), A., ii, 50.
Zoisite (TERMIER), A., ii, 735.
Zymase, precipitation of, from yeast extract (ALBERT and BUCHNER), A., i, 320, 420.
 condition of, in yeast extract (AHRENS), A., ii, 611.

ERRATA.

VOL. LXXVI. (ABSTR., 1899).

PART I.

Page Line
960 19* for " $C_{13}H_{20}ON_2Br_2, H_2PtCl_6$ " read " $(C_{13}H_{20}ON_2Br_2)_2, H_2PtCl_6$."

VOL. LXXVIII. (ABSTR., 1900).

PART I.

24 16 for "8-nitro-1-nitroso-1-naphthol" read "5-nitro-4-nitroso-1-naphthol."
 ,, 20 ,, "1:3:5:4 or 1:3:8:4" read "2:4:8:1 or 2:4:5:1."
 ,, 15* ,, "1:3:5:4" read "2:4:8:1."
 184 10* ,, "oil of cumin" read "oil of caraway."
 255 14 ,, "2-Nitro-" read "10-Nitro-"
 ,, 14, 15 ,, "2-Amino-" read "10-Amino-"
 ,, 16 ,, "2-nitrophenyl" &c., read "10-nitro-7-phenyl" &c.
 ,, 25 ,, "2-amino-3-dimethylamino-5-"
 read "10-amino-9-dimethylamino-7-"
 ,, 14* ,, "2-amino-3-anilinophenylnaphthaphenazonium-5-"
 read "10-amino-9-anilino-7-phenylnaphthaphenazonium"
 ,, 6* ,, "2-amino-5-phenyl" &c., read "10-amino-7-phenyl" &c.
 443 8*, 4*, 3* }
 444 3, 2* } for "lactone" read "anhydride."
 535 15 for "or Trimethylene" read "on Trimethylene."
 578 17* ,, "TCHERDINTZKEFF" read "TSCHERDINTZEFF."
 686 13* ,, "bromoacetone" read "bromoacetophenone."

PART II.

23 14 for "20" read "1899."
 189 6 ,, "+3HO" read "+3H₂O."
 461 18 ,, "Methyl Acetate" read "Ethyl Ether."
 ,, 28 ,, "ethyl acetate" read "ethyl ether."
 474 13 ,, "60°" read "-60°."

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
I.—The Chlorine Derivatives of Pyridine. Part IV. Constitution of the Tetrachloropyridines. By W. J. SELL, M.A., F.I.C., and F. W. DOOTSON, M.A.	1
II.—The Dissociation Constants of very Weak Acids. By JAMES WALKER and WILLIAM CORMACK	5
III.—The Preparation and Properties of Solid Ammonium Cyanate. By JAMES WALKER and JOHN K. WOOD	21
IV.—Etherification of Derivatives of β -Naphthol. By WILLIAM A. DAVIS	33
V.—Contribution to our Knowledge of the Aconite Alkaloids. Part XV. On Japaconitine and the Alkaloids of Japanese Aconite. By WYNDHAM R. DUNSTAN, F.R.S., and HAROLD M. READ, Assistant Chemist in the Scientific Department of the Imperial Institute	45
VI.—A Method of Separation of the various Isomerides contained in ordinary commercial Xylidine. By W. R. HODGKINSON and LEONHARD LIMPACH	65
VII.—The Oxidation of Organic Acids in Presence of Ferrous Iron. Part I. By HENRY J. HORSTMAN FENTON, M.A., F.R.S., and H. O. JONES, B.A., B.Sc.	69
VIII.—Oxalacetic Acid. By HENRY J. HORSTMAN FENTON, M.A., F.R.S., and H. O. JONES, B.A., B.Sc.	77
IX.—Determination of the Constitution of Fatty Acids. Part II. By ARTHUR WILLIAM CROSSLEY and HENRY RONDEL LE SUEUR	83
X.—Preparation of Benzeneazo- <i>o</i> -nitrophenol. By J. T. HEWITT	99

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
ULLMANN (FRITZ) and IRMA GOLDBERG. Purification of Acetylene . . .	i, 1
AHRENS (FELIX B.). The Heating of, and Evolution of Chlorine from, Bleaching Powder Purifiers for Acetylene . . .	i, 1
NEF (JOHN ULRIC). Tri- and Tetra-halogen substituted Methanes . . .	i, 2
THIRLE (JOHANNES). Solid Butadiene Dibromide . . .	i, 2
IPATIEFF (WLADIMIR) [and in part A. SOLONINA]. Nitrosates . . .	i, 3
SPEERANSKI (N.). Hydrogenation of Allyl alcohol . . .	i, 3
BERTHELOT (MARCELLIN PIERRE EUGENE). Simultaneous Oxidation and Hydration of Organic compounds under the influence of Light and Oxygen . . .	i, 3
NEF (JOHN ULRIC). Dissociation of Alkyl salts of Nitric acid, Sulphuric acid, and the Halogen Hydrides . . .	i, 4
POSNER (THEODOR). Disulphones. III. Mercaptols and Disulphones of Ketonic acids and Unsaturated acids derived therefrom . . .	i, 5
WALDEN (PAUL). Resolution of Racemic compounds into their active components . . .	i, 7
BILLITZER (JEAN). Affinity Coefficients of Saturated Fatty acids . . .	i, 7
ORNSTEIN (FRITZ). Water of Crystallisation in the Calcium and Barium salts of γ -Methylvaleric (Isohexoic) acid . . .	i, 7
BÉHAL (AUGUSTE). Mixed Anhydrides of Acyclic and Cyclic acids . . .	i, 8
FICHTER (FRITZ) and ALBERT KRAFFT. Vinylacetic acid . . .	i, 8
MEYER (HANS). Action of Ammonia on Lactones . . .	i, 9
AUWERS (KARL). α -Hydroxy- α -methylisohexylacetic acid [α -Hydroxy- α -dimethylheptoic acid] . . .	i, 9
WISLICIENUS (WILHELM). Influence of the Solvent on the Constitution of Ethyl Acetoacetate and similar Substances . . .	i, 9
SAEMENOFF (W.). β -Bromoglutaric acid . . .	i, 10
WEGSCHEIDER (RUDOLF). Esterification of Camphoric acid. II. . .	i, 10
WALDEN (PAUL). Behaviour of Malic acid when Heated . . .	i, 10
WALDEN (PAUL). Optical Rotation of Malic acid in the Pure State and in Solution . . .	i, 11
STRÖMHOLM (DANIEL). Diethylenedisulphidethetene . . .	i, 12
FROMM (EMIL). History of Thioacetaldehydes . . .	i, 14
IPATIEFF (WLADIMIR) [and in part A. SOLONINA]. Action of Nitrosyl Chloride on Organic compounds containing a Double Linking . . .	i, 14
ULSCH (KARL). Electrolysis of Solutions of Sucrose . . .	i, 15
TOLLENS (BERNHARD). Methyleneglucose from Glucose, Formaldehyde, and Hydrochloric acid: a new Glucoside . . .	i, 15
LE BEL (JOSEPH ACHILLE). Stereochemistry of Nitrogen . . .	i, 15
EMMERLING (OSKAR). Attempts to Prepare a Diaminovaleric acid . . .	i, 16
POSNER (THEODOR) and JOHANNES FAHRENHORST. Disulphones. II. Aminosulphonol and its derivatives and Homologues . . .	i, 16
MARKOWNIKOFF (WLADIMIR B.). Cyclic compounds: Behaviour of Cyclic compounds at Low Temperatures . . .	i, 18
KUBSANOFF (N.). Action of Zinc Methyl and Zinc Ethyl on Chlorohexa- naphthene . . .	i, 19
MOUNEYRAT (A.) and CH. POURET. Action of Bromine on Chlorobenzenes in Presence of Aluminium Chloride . . .	i, 19
VOROŽEK (EMIL) and E. ZENÍŠEK. Electrolytic Modification of Sandmeyer's and Gattermann's Reactions]. . .	i, 19

	PAGE
SCHMIDT (JULIUS). Reduction of Nitrobenzene with Sodium	i, 20
SCHMIDT (JULIUS). Action of Sodium on <i>p</i> -Nitrotoluene	i, 20
ROEDE (ALBERT). Electrolytic Reduction of <i>m</i> -Nitrotoluene	i, 20
NEF (JOHN ULRIC). Phenylacetylene, its salts and Halogen Substitution derivatives	i, 20
LJUBAVIN (NICOLAI N.) [with RESWJAKOFF, RUDENKO, and AREFEEFF]. Naphtha Tar	i, 23
GRAEBE (CARL). Conversion of 1:8- and 1:5-Dinitronaphthalenes into Nitronitrosenaphthols	i, 24
BORSCH (WALTHER). Action of Benzenediazonium Chloride on Alkaline Solutions of Nitrosophenol	i, 24
WHEELER (HENRY LORD) and WILLIAM VALENTINE. Action of Bromine on <i>m</i> -Chloro-, <i>m</i> -Bromo-, and <i>m</i> -Iodo-anilines. II.	i, 25
MÖLLER (JOHANN). Formation of Phenylcarbylamine by the Electrolysis of Alkaline Alcoholic Solutions of Nitrobenzene and Aniline	i, 27
BUSCH (MAX). Action of Hydrazine on Thiocarbanilide	i, 27
STRÖM (KNUT). Chemical Composition of Norwegian Tar from Conifers	i, 28
REVERDIN (FRÉDÉRIC) and F. ECKHARD. Chloroanisidines and Chloroanisol	i, 28
COHN (GEORG). Phenacetin	i, 29
THIELE (JOHANNES) and ROBERT HOWSON PICKARD. Transformation of Hydroxamic acids	i, 29
VANDEVELDE (ALB. J. J.). Phenoxyacetic acid. Bromination of Phenoxy-cinnamic acid	i, 30
LIMPRICHT (HEINRICH) [and THEODOR LACH]. Diphenylmethane-2:4'-dicarboxylic acid.	i, 31
LIMPRICHT (HEINRICH). Benzophenone-2:4'-dicarboxylic acid	i, 32
ERRERA (GIORGIO). Mixed Methenyl compounds. I. and II. Action of Ethyl Ethoxymethylacetate and Ethoxymethylenemalonate on Ethylacetonedicarboxylate	i, 33
CARVETH (HECTOR R.). <i>p</i> -Anisaldoximes	i, 34
AMEYE (MICHEL). Distillation of Dypnone	i, 35
HESSE (OSWALD). Pseudodicotoin	i, 35
GOLDSCHMIEDT (GUIDO) and GUSTAV KNÖFFER. Condensation of Dibenzyl Ketone with Benzaldehyde	i, 35
FULDA (HUGO LUDWIG). Condensation products of <i>o</i> -Aldehydic acids with Ketones	i, 36
WISLICIENUS (JOHANNES) [with BRUNO LÖWENSTEIN, PAUL SCHMIDT, and HARRY EDWARD WELLS]. Isomeric forms of Dibenzoylmethane	i, 37
SMITH (ALEXANDER). Potassium Cyanide as a condensing agent	i, 38
SCHIFF (ROBERT). Preparation and configuration of the six Isomeric inactive Benzylidenebisacetylacetones	i, 39
HESSE (OSWALD). Compounds from Rhubarb and allied substances	i, 40
JAUBERT (GEORGE F.). Naphthapurpurin (Trihydroxy- α -naphthaquinone)	i, 42
KLAGES (AUGUST) and A. KRAITH. The Carvone series	i, 42
KLAGES (AUGUST). Pulegone and Methylhexanone	i, 44
WALLACH (OTTO) [with EUGEN VON BIRON, TH. BÖCKER, AD. GILBERT, W. RATH, and HERM. UMBROVE]. Terpenes and Ethereal oils; Ring disruption and ring formation among Terpene derivatives	i, 44
WAGNER (GEORG) and W. BROCKNER. Relation of Pinene Hydrochloride and Hydriodide to Bornyl Chloride and Iodide	i, 46
HESSE (ALBERT). Ethereal oil of Jasmine Flower	i, 48
BAMBERGER (MAX) and ANTON LANDSIEDL. Natural Resins (Überwallungsharze). V.	i, 48
GADAMER (JOHANNES). Ethereal Oils of Cresses and the Glucosides from which they are formed	i, 49
SCHIFF (HUGO). Amygdalinamidoxime	i, 49
HAUSMANN (ARTHUR). <i>Extractum filicis aethereum</i>	i, 49
TSVETI. Constitution of the colouring matter of Leaves: Chloroglobin	i, 50
HESSE (OSWALD). Alkaloids of the <i>Solanaceae</i>	i, 50

	PAGE
ROSER (WILHELM). Narcotine	i, 51
VONGERICHTEN (EDUARD). α -Dinitrophenylpyridine Chloride	i, 51
SPIEGEL (LEOPOLD). Dinitrophenylpyridine Chloride	i, 51
KIRPAL (ALFRED). Alkyl salts of Quinolinic and Cinchomeric acids	i, 51
GUARESOHI (ICILIO). Dicyanohydroxypyridones	i, 52
FULDA (HUGO LUDWIG). Benzoylpyridinecarboxylic acids	i, 53
GABRIEL (SIEGMUND) and JAMES COLMAN. Derivatives of 4-Methylpyrimidine [4-methyl- <i>m</i> -diazine]	i, 53
BÜLOW (CARL) and ALFRED SCHLESINGER. Preparation of Isopyrazole derivatives from Diethyl Benzeneazodiacetylsuccinate	i, 56
SCHUYTEN (M. C.). Double Chlorides of Copper and Antipyrine	i, 57
SCHUYTEN (M. C.). Metallic Benzopyrines	i, 57
SCHUYTEN (M. C.). Constitution of Metallic Salipyrynes	i, 57
WERNER (ALFRED) and TH. HERBERGER. Formation of Ring compounds by elimination of Aromatic Nitro-groups	i, 57
BUSCH (MAX) [and LUDWIG HARTMANN]. Triazines from <i>o</i> -Aminoazo-compounds	i, 59
KEHRMANN (FRIEDRICH) and P. FILATOFF. The Eighth and Ninth Isomerides of Rosinduline	i, 60
KEHRMANN (FRIEDRICH) and ZENAIDE KIKINE. Nitro- and Amino-flavindulines	i, 61
KEHRMANN (FRIEDRICH) [with KRAMER, L. SCHILD, and P. THOMAS]. Constitution of Oxazine Dyes, and Quadrivalent Oxygen	i, 61
BEHREND (ROBERT) and RICHARD GRÜNWALD. Aminouracil	i, 63
FISCHER (EMIL) and FRIEDRICH ACH. Isomerism of the Methyluric acids	i, 63
BÜLOW (CARL). Inactive <i>b-p</i> -Nitranilineazobenzoylacetone [<i>p</i> -Nitrobenzene-azobenzoylacetone]	i, 65
BUSCH (MAX) and E. LINGENBRINK. Hydrazones of Dithiocarbonates	i, 66
BLUM (F.). The Iodine Number of Proteids	i, 67
TSVETT. Reversible Liquefaction of Proteids	i, 67
KUTSCHER (FR.). Detection of Glutaric acid amongst the products obtained by decomposing Albumin of Animal origin with strong Sulphuric acid	i, 67
PICK (ERNST P.). Products of the Peptic digestion of Fibrin	i, 68
KÜSTER (WILLIAM). Products of the decomposition of Hæmatin	i, 68
KÜSTER (WILLIAM) and MARTIN KÖLLE. Preparation and products of decomposition of Hæmatoporphyrin	i, 69
LIVERSIDGE (ARCHIBALD). Blue Pigment in Coral (<i>Heliopora cœrulea</i>) and other animal organisms	i, 70
BOLAND (G. W.). Pyocyanin, the Blue Colouring matter of <i>Bacillus pyocyanus</i>	i, 70
PANZER (THEODORE). Ovarian Colloid	i, 70
GIERTZ (K. H.). Pseudo-nucleins	i, 71
FLEROFF (A.). Histon-like substance from the Thymus	i, 71
LAWBOFF (D.). Decomposition products of Histon from Leucocytes	i, 71
KOSSEL (ALBRECHT) [CARL LUDWIG MARTIN LEONHARD] and FR. KUTSCHER. Histidine	i, 71
WETZEL (G.). Decomposition products of Conchiolin	i, 71
KLIMMER (MARTIA). Lilienfeld's synthesis of Peptone	i, 72
KUTSCHER (FR.). Antipeptone	i, 72
MORKOWIN (N.). Protamines	i, 72
ABEL (JOHN J.). Epinephrine	i, 72

ERRATA.

VOL. LXXIV. (ABSTR., 1898).

PART I.

Page.	Line.	
700	4*	for "α-uric" read "α-methyluric."

VOL. LXXV. (TRANS., 1899).

98	6	„ "ce" read "ice."
----	---	--------------------

VOL. LXXVI. (ABSTR., 1899).

PART I.

268	13*	„ "sulphuric" read "nitric."
848	10*	„ " $C_3H_4(OH:CHMe)$ " read " $C_3H_4(OH:CHMe)_2$."
875	20*	„ "propylic" read "isopropylic."
887	5*	„ " $NHPh \cdot CO \cdot NH_2R$ " read " $NHPh \cdot CO \cdot NHR$."
891	21*	„ "-3-dinitro-" read "-3 : α-dinitro-."
917	8*	„ "α-Dinaphthylbenzene" read "α-Dinaphthylbenzidine."

PART II.

725	22	„ "Cd CdCl ₂ Cl ₂ " read "Cd CdCl ₂ Cl."
762	14	„ "József" read "JÓZSEF."

* From bottom.

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
X.—Preparation of Benzeneazo- <i>o</i> -nitrophenol. By J. T. HEWITT (continued)	101
XI.—Ethyl Dibromobutanetetracarboxylate and the Synthesis of Tetrahydrofurfuran-2:5-dicarboxylic Acid. By BEVAN LEAN, D.Sc., B.A.	103
XII.—The Atomic Weight of Nitrogen. By GEORGE DEAN, B.A.	117
XIII.—Formation of α - and β -Acrose from Glycollic Aldehyde. By HENRY JACKSON, B.A., Fellow of Downing College, Cambridge	129
XIV.—Substituted Nitrogen Chlorides and their Relation to the Substitution of Halogen in Anilides and Anilines. Part II. The Trichlorophenyl Acyl Nitrogen Chlorides. By F. D. CHATTAWAY and K. J. P. ORTON	134
XV.—The Decomposition of Chlorates, with Special Reference to the Evolution of Chlorine and Oxygen. Part I. By WILLIAM H. SODEAU, B.Sc.	137
XVI.—The Interaction of Sulphuric Acid and Potassium Ferrocyanide. By RICHARD HALIBURTON ADIE, M.A., B.Sc., and KENDALL COLIN BROWNING, B.A.	150
XVII.—Action of Alkyl Iodides on the Mercuric Iodide Sulphides of the Fatty Series. By SAMUEL SMILES, B.Sc.	160

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

KRÄMER (GUSTAV) and ADOLF SPILKER. The Wax of <i>Bacillariaceæ</i> and its connection with Petroleum	i, 73
CHARITSCHEFF (K. W.). Heptane contained in Grosny Naphtha	i, 74
GOOCH (FRANK A.) and DR FOREST BALDWIN. Action of Acetylene on Oxides of Copper	i, 74
SERRA (E.). Preparation of Tetrachloromethane	i, 74

	PAGE
STEFFENS (CARL). Isomeric compounds, $C_6H_5O_4N_4$, from Acetylmethyl-nitrolic acid	i, 74
CAVALIER (JACQUES). Phosphoric Esters	i, 75
GUÉDRAS (MARCEL). Manufacture of Glycerophosphates	i, 75
SMITH (EDGAR F.) and CLAUDE DUGAN. Esters of Tungstic acid	i, 76
BARR (EDWIN DE). Action of Water on certain Fatty acids	i, 76
CLARKE (CHARLES F.) and EDGAR F. SMITH. Electrolytic Oxidation of Succinic acid	i, 77
RUFF (OTTO) and GERHARD OLLENDORFF. Separation and Purification of Sugars	i, 77
POTTEVIN (HENRI). Isomaltose	i, 77
BAU (ARMINIUS). Crystallised Melibiose	i, 77
TANRET (CHARLES) and GEORGES TANRET. Rhamnose	i, 78
SYNIEWSKI (WIKTOR). Constitution of Starch	i, 78
RODEWALD (HERMANN) and A. KATTEIN. Preparation of Starch Solutions and separation of Starch Granules from such Solutions	i, 79
POTTEVIN (HENRI). Saccharification of Starch	i, 80
POTTEVIN (HENRI). Maltodextrin	i, 81
GAUTIER (ARMAND [ÉMILE JUSTIN]). Preparation and estimation of Glycogen	i, 81
RÖSER and PUAUX. Composition of the Gum of <i>Grevillea robusta</i>	i, 82
LUCAS (AD.). Nitroacetone	i, 82
SOLOMINA (WASSILY). γ -Amino- $\beta\beta$ -dimethylbutane	i, 82
CLARKE (THOMAS). β -Heptylamine	i, 83
BERTHELOT (MARCELLIN PIERRE EUGÈNE). Behaviour of Diamines on Neutralisation	i, 83
BERTHELOT (MARCELLIN PIERRE EUGÈNE). Diamines. Diethylene-diamine (Piperazine)	i, 83
AUWERS (KARL) [with FRITZ MAYER and F. SCHLEICHER]. Amic acids and Imides of Aliphatic Dicarboxylic acids	i, 84
SCHIFF (HUGO). Methylenearparagine and allied compounds	i, 85
HANTZSCH (ARTHUR [RUDOLF]). Nitrosoalkylurethanes	i, 86
WERNER (ALFRED), F. BRÄUNLICH, R. KLIEN, and HERBERT MÜLLER. Constitution of Inorganic compounds. XX. Thiocyanocobalt salts and structural Isomerides	i, 86
DENIGÈS (GEORGES). Organomercuric compounds	i, 89
SMITH (EDGAR F.), E. A. BARNETT, and CLARENCE HALL. Tungsten Alkyls	i, 89
KURSANOFF (N.). Cyclic compounds. Ethylhexanaphthene and Mercuro-heptanaphthene Iodide	i, 89
HANTZSCH (ARTHUR) and HERMANN KISSEL. Derivatives of Nitroic acids and reactions of Nitro-compounds	i, 89
LEMOINE (GEORGES). Transformation of Styrene into Metastyrene under the influence of Light	i, 91
ERDMANN (HUGO). Naphthalene-1 : 3 : 5-trisulphonic acid	i, 91
ODDO (GIUSEPPE). Polymerisation of Inorganic Chloro-anhydrides	i, 92
COHN (GEORG). Salicylanilinoacetic acid (<i>o</i> -Carboxyphenylglycollic acid monoanilide) and its derivatives	i, 93
GNEHM (ROBERT) and H. WERDENBERG. Diphenylamine derivatives, especially Sulphonic acids	i, 93
HANTZSCH (ARTHUR [RUDOLF]). Characterisation of Weak acids and Pseudo-acids	i, 94
AUWERS (KARL). Bromophenols insoluble in Alkalis	i, 96
AUWERS (KARL). Bromophenols from <i>as-o</i> -Xylenol and <i>as-m</i> -Xylenol	i, 96
AUWERS (KARL) and W. HAMPE. Pentabromide from [Pentabromo-derivative of] <i>as-m</i> -Xylenol	i, 96
AUWERS (KARL) and R. FREIHERR VON ERGGELET [and in part H. VAN DE ROVAART and W. WOLFF]. Pentabromo-derivative of <i>as-o</i> -Xylenol	i, 97
AUWERS (KARL) and HARRY BURROWS [and in part H. VAN DE ROVAART]. Heptabromo-derivative of <i>as-o</i> -Xylenol	i, 98

	PAGE
MOUREU (CHARLES). Catechol derivatives	i, 99
VORLÄNDER (DANIEL). Hydrogenised derivatives of Diphenylmethane and Triphenylmethane	i, 99
VORLÄNDER (DANIEL) and FRITZ KALKOW. Formaldehyde derivative of Dihydroresorcinol	i, 99
VORLÄNDER (DANIEL) and O. STRAUSS. Compounds of Dihydroresorcinol with Aromatic Aldehydes	i, 100
MARCHLEWSKI (LEO). Tautomerisation of Isatin	i, 100
WEINER (ALFRED) and H. E. CONRAD. Optically active <i>trans</i> -Hexahydro-phthalic acid	i, 100
FRANCESCONI (LUIGI). Constitution of Santonic and Metasantonic acids and of Metasantonin	i, 101
POND (F. J.), O. P. MAXWELL, and G. M. NORMAN. Action of Sodium Methoxide on Dibromides of Propenyl compounds and of Unsaturated acids	i, 102
FARMER (ROBERT C.) and ARTHUR HANTZSCH. α -Oximinoketones and Quinoneoximes as Pseudo-acids	i, 103
MORGAN (WILLIAM CONGER). Space Isomerism of the Ethers of Tolu-quinoneoxime	i, 103
KONDAKOFF (IWAN L.) and EUGEN LUTSCHININ. Isomerism in the Menthol Series	i, 104
ZAHARIA (AL. J.). Solubility of Camphor in Hydrochloric acid	i, 106
SCHREINER (OSWALD) and EDWARD KREMERS. Nitroso-derivatives of Caryophyllene and Cadinene and their bearing on the Characterisation and Classification of the Sesquiterpenes	i, 106
ALPERS (WILLIAM C.). Oil and Terpenes from <i>Aralia nudicaulis</i>	i, 107
HAENSEL (HEINRICH). Liquorice Oil	i, 107
FICHTER (FRITZ) and E. KATZ. Ethereal Oil of Poplar Buds	i, 108
BEYERINOK (MARTINUS WILLEM). Glucosides and Enzymes contained in the root of some <i>Spiræas</i>	i, 108
SILLEVOLDT (H. E. TH. VAN). Derride and Pachyrhizide, Indian Fish Poisons	i, 109
BODE (G.). Chlorophyll	i, 109
BODE (G.). Phylloxanthin	i, 109
ANDRÉK (KARL). Furfuraldehyde from Beetroot and Molasses	i, 110
SCHULZE (ERNST) and ERNST WINTERSTEIN. Constitution of Arginine	i, 110
LAWROFF (D.). Benzoyl Compound of Hexon Bases	i, 110
PICCININI (ANTONIO). An Alkaloid contained in the Bark of the Pomegranate	i, 110
FENNER (GOTTFRIED) and JULIUS TAFEL. Abnormal Aurichlorides of Organic Bases	i, 111
GUARESCHI (ICILIO) and ERNESTO GRANDE. Synthesis of Glutaric and Trimethylene derivatives	i, 111
GUARESCHI (ICILIO) and ERNESTO GRANDE. Action of Heat on Hydrogenised compounds	i, 112
HANTZSCH (ARTHUR) and M. KALB. Pseudo-ammonium bases	i, 113
CAMPS (RUDOLF). Synthesis of 2- and 4-Hydroxyquinolines	i, 116
TRAUBE (WILHELM) and H. W. F. LORENZ. Carbamide and Thiocarbamide derivatives of Diacetoneamine	i, 115
TRAUBE (WILHELM) and RUDOLF SCHWARZ. Action of Amidines on Mesityl Oxide and Phorone	i, 116
TRAUBE (WILHELM) and MAX SCHALL. Carbamide and Guanidine derivatives of Diacetoneamine	i, 118
TRAUBE (WILHELM) and A. EYME. Additive Products of the Carbo-diimides	i, 118
HENZE (MARTIN). Preparation of Phenylindoxyl	i, 119
GREEN (ARTHUR GEORGE). Orthoquinonoid Structure of Safranin, Oxazine, and Thiazine Colouring Matters	i, 119
BEHREND (ROBERT) and EMIL DIETRICH. Constitution of δ -Methyluric acid	i, 120

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
Victor Meyer Memorial Lecture. By T. E. THORPE, Ph.D., D.Sc., LL.D., F.R.S., President of the Chemical Society	169
XVIII.—Electrolytic Preparation of Induline Dyes. By EMBRIQUE CHARLES SZARVASY, Ph.D.*	207
XIX.—Action of Chloroform and Potassium Hydroxide on <i>o</i> -Aminobenzoic Acid. By WALTER J. ELLIOTT, M.A.	213
XX.—Anhydrous Sulphates of the Form $2M'SO_4, R'SO_4$; especially those of Isometric Crystallisation. By FREDERIC R. MALLET	216
XXI.—C-Derivatives of Hydroxytriazole. By GEORGE YOUNG, Ph.D., and ERNEST WITHAM, B.A., B.Sc.	224
XXII.—Note on Volhard's Method for the Assay of Silver Bullion. By THOMAS KIRKE ROSE, D.Sc.	232
XXIII.—The Chlorine Derivatives of Pyridine. Part V. The Constitution of Oitrazinic Acid. Formation of 2:6-Dichloropyridine and 2:6-Diiodoisonicotinic Acid. By W. J. SELL, M.A., F.I.C., and F. W. DOOTSON, M.A.	233
XXIV.—The Formation of Heterocyclic Compounds. By SIEGFRIED RUHEMANN and H. E. STAPLETON, Scholar of St. John's College, Oxford	239
XXV.—Studies in the Camphane Series. Part I. Nitrocamphane. By MARTIN ONSLOW FORSTER	251
XXVI.—The Refractive and Magnetic Rotatory Powers of some Benzenoid Hydrocarbons. The Refractive Powers of Mixtures. An improved Spectrometer Scale Reader. By W. H. PERKIN, LL.D., Ph.D., F.R.S.	267
XXVII.—The Condensation of Formaldehyde with Ethyl Malonate, and Synthesis of Pentamethylene-1:2:4-tricarboxylic Acid. By J. FRANK BOTTOMLEY and W. H. PERKIN, jun.	294
XXVIII.—Action of Fuming Nitric Acid on α -Dibromocamphor. By ARTHUR LAPWORTH and EDGAR M. CHAPMAN, Salter's Fellow in the Research Laboratory of the Pharmaceutical Society of Great Britain	309

* Owing to a delay in the preparation of the process block, this paper was unavoidably held over from publication in the February part of the Transactions.

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
TSCHUGAEFF (L.). New method of preparing Unsaturated Hydrocarbons	i, 129
KLING (ANDRÉ). Biochemical Oxidation of Propylene Glycol	i, 129
LÉSER (GEORGES). Cyclic Isomeric change of Methylcyclohexadienonol	i, 129
DELÉPINE (MARCEL). Methylene Sulphate or Sulphuric Methylal	i, 130
IMBERT (HENRI) and GUILLAUME BELUGOU. Velocity and Limits of the Esterification of Phosphoric acid	i, 130
WOHL (ALFRED) and C. NEUBERG. Acid Esters of Boric acid	i, 131
BOUVEAULT (LOUIS). α -Dimethylisocrotonic (2-dimethyl-3-butenoic) acid	i, 131
GOLDSCHMIDT (HEINRICH) and LAZAR OSLAN. Ethyl Acetoacetate	i, 132
BAEYER (ADOLF VON) [with OTTO SEUFFERT]. Orientation in the Terpene Series. XXIV	i, 132
BAEYER (ADOLF VON) and VICTOR VILLIGER. Action of Caro's Reagent on Ketones	i, 133
BLANC (G.). Action of Aluminium Chloride on Camphoric Anhydride	i, 133
BREDT (JULIUS) and WILHELM JAGELKI. Camphenilanaldehyde and Camphenilanic acid	i, 134
MAQUENNE (LÉON). Preparation of Azelaic acid	i, 135
ERDMANN (HUGO). Malic acid from <i>Hippophae rhamnoides</i>	i, 135
ROSENHEIM (ARTHUR) and HERRMANN ITZIG. Some complex salts of Tartaric and Malic acids and their Specific Rotatory Power	i, 135
BREDT (JULIUS) and J. B. C. KERSHAW. Action of Nitric acid on Acids of the Fatty series which contain the Isopropyl group	i, 136
LABBÉ (HENRI). Natural Cyclic Isomeric Change of Citronellal	i, 136
LABBÉ (HENRI). Formation of Barium Citryl and Citronellyl Sulphites	i, 137
BIDDLE (HENRY C.). Derivatives of the Isuretine of Formhydroxamic acid and their relation to Fulminic acid	i, 137
NEUBERG (CARL). Purification of Osazones and Estimation of their Rotatory Power	i, 139
RUFF (OTTO) [and in part MEUSSER]. <i>d</i> -Erythrose	i, 139
WOHL (ALFRED). Degradation of <i>l</i> -Arabinose	i, 140
FISCHER (EMIL). Resolution of Racemic compounds into active components	i, 140
FRANCHIMONT (ANTOINE PAUL NICOLAS). Action of Acetic Anhydride on Cellulose in presence of Sulphuric acid	i, 141
ASTRUC (A.). Alkalimetry of the Amines	i, 141
RAGLAND (C. D.). Double Halogen salts of Cadmium with the Methylamines and Tetramethylammonium	i, 141
COOK (C. G.). Double Halogen salts of Tin with Aliphatic Amines and with Tetramethylammonium	i, 142
SPRUYT (G. BELLAAR). Physiological action of Methylnitramine in relation to its Chemical Constitution	i, 142
PALOMAA (H.). Preparation of Ethyldichloroamine	i, 143
TOERNIAC (JOSEPH). Preparation of Ethyldichloroamine	i, 143
MAROKWALD (WILHELM). Stereochemistry of Nitrogen [Propylisobutylamine]	i, 143
ELLINGER (ALEXANDER). Constitution of Lysine	i, 143
MEERBURG (P. A.). Derivatives of Pyrotartaric acid and of the Isomeric Glutaric acid	i, 143
CAZENEUVE (PAUL). Synthesis of Parabanic acid	i, 144

	PAGE
SCHOLL (ROLAND). Constitution and Synthetical Application of Mercury Fulminate. I. Direct Aldoximation of Benzene	i, 144
BAMBERGER (EUGEN) and JENS MÜLLER. Action of Nitric Peroxide on Mercury dimethyl	i, 145
IMBERT (HENRI). Heat of Neutralisation and Acidimetry of Cacodylic acid	i, 145
WISCHIN (RUDOLF). Cyclic Polymethylenes of [Russian] Petroleum	i, 146
GIRAN (H.). New compounds of Phosphoric Oxide with Benzene	i, 146
CALHANE (D. F.) and P. M. WHEELER. Constitution of α -Dibromodinitrobenzene	i, 146
BRUYN (CORNELIS ADRIAAN LOBBY DE). Rate of Substitution of Nitro-groups by an Alkoxy Group	i, 146
RAALTE (A. VAN). Phenyl- and <i>p</i> -Chlorophenyl-nitromethane	i, 147
SOLONINA (BASIL A.). Separation of Primary, Secondary, and Tertiary Amines by Ginsberg's method	i, 147
MARCKWALD (WILHELM). Behaviour of Sulphonamides of Primary Amines towards Alkalis	i, 149
LABBÉ (HENRI). Fixation of Sodium Hydrogen Sulphite by Ethylene Linkings	i, 149
KRAEMER (GUSTAV) and ADOLF SPILKER. Resin Oil	i, 150
FRIEDLÄNDER (PAUL). Conversion of 1:5- and 1:8- Dinitronaphthalenes into Nitronitrosenaphthols	i, 150
PELLEGRIN (MICHEL). Fittig's Reaction	i, 151
HIEN (T.). Synthesis of Picene	i, 151
RICHARDSON (GEORGE H.) and MAXWELL ADAMS. Double Halogen salts of Tin with Organic Bases	i, 151
CHATTAWAY (FREDERICK D.), KENNEDY J. P. ORTON, and W. H. HURTLEY. Anilides	i, 151
CHATTAWAY (FREDERICK D.) and KENNEDY J. P. ORTON. Substituted Nitrogen Bromides, and their relationship to Bromo-substituted Anilides and Anilines	i, 152
VITTENET (HENRI). <i>s</i> -Dinitrodixylylcarbamides and Dinaphthylcarbamides	i, 153
VITTENET (HENRI). Aromatic Carbimides	i, 153
WEDEKIND (EDGAR). Characteristics of Stereoisomeric Ammonium Salts	i, 155
HUGERSHOFF (A.). Acyl derivatives of the Aromatic Thiocarbamides: their Isomerism and Constitution	i, 155
ORNDORFF (WILLIAM R.) and F. A. RICHMOND. Phenylthiocarbimide as a Reagent for the detection of the Alcoholic Hydroxyl group	i, 156
WOHL (ALFRED). Conversion of Nitrobenzene into <i>o</i> -Nitrophenol by means of Caustic Potash	i, 157
MOREL (ALBERT). Reaction of Phenyl Chloroacetate	i, 157
MOREL (ALBERT). Reactions of Phenyl Chloroacetate and Phenyl Glycollate	i, 158
KYM (OTTO). Action of Chlorodinitrobenzene on Potassium Benzoate and on Acetamide	i, 158
BRIDGE (JOHN L.) and WM. CONGER MORGAN. Ethers of Isonitrosoguaiacol in their relation to the Space Isomerism of Nitrogen	i, 158
AUWERS (KARL). Relation between the structure of Meta-phenol [<i>m</i> -Hydroxybenzyl] Haloids and their behaviour towards Alkalis	i, 159
AUWERS (KARL) and O. ANSELMINO. Degradation of Phenols during Bromination	i, 159
AUWERS (KARL). Action of Chloroform and Alkalis on 1:3:4-Xylenol	i, 160
AUWERS (KARL). Oxidation products of Phenols and Bromophenols, and the constitution of the Isomeric Tribromo- ψ -cumenol	i, 161
AUWERS (KARL) and A. EBNER. Oxidation products of Tribromo- ψ -cumenol	i, 161
AUWERS (KARL) and TH. MAAS. Dibromo- <i>m</i> -hydroxy- ψ -cumyl dibromide	i, 162
AUWERS (KARL) and J. BROCHER [and in part W. WOLFF]. Oxidation products of Phenols and Bromophenols	i, 162

	PAGE
BOURGEOIS (EDOUARD). Preparation of Aromatic Thiols	i, 163
HENRICH (FERDINAND). Constitution of Mononitrosoresorcinol	i, 163
DELÉPINE (MARCEL). Action of Methylene Sulphate on Benzyl Alcohol	i, 163
AUWERS (KARL) and S. DAECKE. Action of Bromine on <i>p</i> -Hydroxybenzyl Alcohol	i, 164
AUWERS (KARL) and W. RICHTER. Action of Bromine on <i>m</i> -Hydroxybenzyl Alcohol	i, 165
AUWERS (KARL), F. A. TRAUN, and R. WELDE. Tribromo-derivatives of ψ -Cumenol and Mesitol	i, 165
AUWERS (KARL) and F. A. TRAUN. Dibromo- <i>p</i> -hydroxymesityl Alcohol	i, 167
AUWERS (KARL), F. A. TRAUN, and K. WELDE. Substituted Phenyl Benzyl Ethers	i, 168
RABAUT (CHARLES). Hydrolysis of Benzonitrile	i, 170
PSCHOER (ROBERT) and O. WOLFES. Isomeric change of <i>o</i> -Amino- and <i>o</i> -Nitro-cinnamonitriles	i, 170
HALLER (ALBIN) and ALFRED GUYOT. Tautomerism of <i>o</i> -Benzoylbenzoic acid	i, 170
BOUVEAULT (LOUIS). Synthesis of Cyclopentane derivatives by means of Ethyl Adipate	i, 171
DAM (J. W. VAN). Action of Potassium Hypobromite on Amides of Hydroxybenzoic acids	i, 171
HENRY (LOUIS). Anisonitrile	i, 172
FISCHER (EMIL). Resolution of Racemic Amino-acids into optically active components	i, 172
PECHMANN (HANS VON). Coumarins	i, 173
PECHMANN (HANS VON) and MAX SCHAAL. Coumarins. II. 7-Dimethyl-amino-4-methylcoumarin and Homologues	i, 173
PECHMANN (HANS VON) and OTTO SCHWARZ. Coumarins. III. 7-Amino-4-methylcoumarin	i, 174
PECHMANN (HANS VON) and OTTO SCHWARZ. Coumarins. IV. Action of <i>m</i> -Aminophenol on Ethyl Acetoacetate	i, 174
ANSELM (FRITZ) and F. ZUCKMAYER. Derivatives of Naphthalic acid	i, 175
HERZIG (JOSEF) and FRANZ WENZEL. Methyl Phloroglucinolcarboxylate	i, 176
SLAMA (FRANZ). Preparation of Hydroxystyrogallol	i, 177
BRÄUTIGAM (W.). Solanthalic acid	i, 177
DELÉPINE (MARCEL). Metallic derivatives of Salicylhydramide	i, 177
LABBÉ (HENRI). Preparation of Anisaldehyde	i, 177
BAUR-THURGAV (ALBERT) and AUGUST BISCHLER. Aldehyde-musk	i, 178
PSCHOER (ROBERT) and C. SUMULEANU. <i>o</i> -Nitrovanillin	i, 178

ERRATA.

VOL. LXXVII. (TRANS., 1900).

Page Line

139 8* for "mixture of iodate (the iodine) and iodide of potassium to be titrated"
 read "mixture of iodate and iodide of potassium (the iodine to be
 titrated)."

VOL. LXXVIII (ABSTR., 1900).

PART I.

24 15 for "8-nitro-1-nitroso-1-naphthol" read "5-nitro-4-nitroso-1-naphthol."
 ,, 19 ,, "1:3:5:4 or 1:3:8:4" read "2:4:8:1 or 2:4:5:1."
 ,, 15* ,, "1:3:5:4" read "2:4:8:1."

PART II.

139 6 ,, "+3HO" read "+3H₂O."

* From bottom.

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
XXVIII.—Action of Fuming Nitric Acid on α -Dibromocamphor. By ARTHUR LAPWORTH and EDGAR M. CHAPMAN, Salter's Fellow in the Research Laboratory of the Pharmaceutical Society of Great Britain (<i>Continued</i>) . . .	317
XXIX.—The Absorption Spectra of Ammonia, Methylamine, Hydroxylamine, Aldoxime, and Acetoxime. By WALTER NOEL HARTLEY, F.R.S., and JAMES J. DOBBIE, D.Sc., M.A. .	318
XXX.—Ammonium Amidosulphate. By EDWARD DIVERS and MASATAKA OGAWA	327
XXXI.—Products of Heating Ammonium Thiosulphate, Sulphites, and Trithionate. By EDWARD DIVERS and MASATAKA OGAWA	335
XXXII.—The Combination of Sulphur Dioxide and Oxygen. By EDWARD JOHN RUSSELL and NORMAN SMITH . . .	340
XXXIII.—Notes on the Estimation of Gaseous Compounds of Sulphur. By EDWARD JOHN RUSSELL	352
XXXIV.—Influence of the Nascent State on the Combination of Dry Carbon Monoxide and Oxygen. By EDWARD JOHN RUSSELL	361
XXXV.—Note on the Refraction and Magnetic Rotation of Hexamethylene, Chlorohexamethylene, and Dichlorohexamethylene. By SYDNEY YOUNG, D.Sc., F.R.S., and EMILY C. FORTEY, B.Sc.	372
XXXVI.—Campholytic and Isolaurenic Acids. By JAMES WALKER and WILLIAM CORMACK	374
XXXVII.—Configuration of the Camphoric Acids. By JAMES WALKER and JOHN K. WOOD	383

	PAGE
XXXVIII.—The Constitution of Camphoric Acid. By JAMES WALKER	390
XXXIX.—The Maximum Pressure of Naphthalene Vapour. By RICHARD WILLIAM ALLEN, M.A., University College, Auckland, N.Z.	400
XL.—The Maximum Pressure of Camphor Vapour. By RICHARD WILLIAM ALLEN, M.A., University College, Auckland, N.Z.	413
XLI.—Apiin and Apigenin. Part II. Note on Vitexin. By ARTHUR GEORGE PERKIN, F.R.S.E.	416
XLII.—Yellow Colouring Principles contained in Various Tannin Matters. Part VII. <i>Arctostaphylos Uva ursi</i> , <i>Hæmatoxylon Campeachianum</i> , <i>Rhus Metopium</i> , <i>Myrica Gale</i> , <i>Coriaria myrtifolia</i> , and <i>Robinia pseudacacia</i> . By ARTHUR GEORGE PERKIN, F.R.S.E.	423
XLIII.—Potassium Nitrito-hydroximidosulphates and the Non-existence of Dihydroxylamine Derivatives. By EDWARD DIVERS, M.D., D.Sc., F.R.S., Emeritus Professor of Chemistry, and TAMEMASA HAGA, D.Sc., Professor of Chemistry in the Tōkyō Imperial University, Japan	432
XLIV.—Identification and Constitution of Fremy's Sulphazotised Salts of Potassium. By EDWARD DIVERS and TAMEMASA HAGA	440
XLV.—Camphonic, Homocamphoric, and Camphononic Acids. By ARTHUR LAPWORTH and EDGAR M. CHAPMAN, Salter's Fellow in the Research Laboratory of the Pharmaceutical Society	446
XLVI.—New Syntheses of Indene. By F. STANLEY KIPPING, Ph.D., D.Sc., F.R.S., and HAROLD HALL, A.I.C.	467
XLVII.—Pilocarpine and the Alkaloids of Jaborandi Leaves. By HOOPER ALBERT DICKINSON JOWETT, D.Sc.	473
XLVIII.—Spectrographic Studies in Tautomerism. The Absorption Curves of the Ethyl Esters of Dibenzoylsuccinic Acid. By WALTER NOEL HARTLEY, F.R.S., and JAMES J. DOBBIE, M.A., D.Sc.	498
XLIX.—The Curves of the Molecular Vibrations of Benzantialdoxime and Benzsynaldoxime. By WALTER NOEL HARTLEY, F.R.S., and JAMES J. DOBBIE, M.A., D.Sc.	510

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
DONATH (EDUARD) and HUGO DITZ. Oxidation of Organic compounds with Alkaline Potassium Permanganate	i, 197
MIXTER (WILLIAM GILBERT). Products of the Explosion of Acetylene	i, 197
SABATIER (PAUL) and JEAN B. SENDRENS. Action of Copper on Acetylene : Formation of Cuprene, a highly condensed Hydrocarbon	i, 197
MINUNNI (GAETANO). Action of Hydroxylamine on Dehydracetic acid	i, 198
SIMON (L. J.). Isopyromucic acid	i, 198
ASTRUO (A.). Acidimetry of Organic Polybasic acids	i, 199
ABERSON (J. H.). Optical Activity of Hydroxypyruvic acid	i, 200
STADT (E. VAN DE). Solubility in Water of Anhydrides of Organic acids	i, 200
MASSOL (GUSTAVE). Acidimetric Value of Substituted Malonic acids compared with that of corresponding Normal Dibasic acids	i, 200
BROWN (A. CRUM) and HERBERT W. BOLAM. Electrolysis of Ethyl Potassium Diethoxysuccinate	i, 201
KOMPPA (GUSTAV). Constitution of saturated Dicarboxylic acids	i, 201
HALLER (ALBIN) and G. BLANC. Synthesis of Camphoric acid by means of Camphoric acid	i, 202
BALBIANO (LUIGI). Camphoric acid	i, 202
NOYES (WILLIAM ALBERT). Camphoric acid : Synthesis of a Camphor-derivative, 2 : 3 : 3-Trimethylcyclopentanone	i, 202
BUCHER (JOHN E.). Action of Ethyl Iodide on Diethyl Tartrate and Sodium Ethoxide	i, 203
ORDONNEAU (CHARLES). Malates and Tartromalates	i, 203
DENIGES (GEORGES). Oxidation of Citric and Malic acids by Potassium Permanganate	i, 204
MAYER (PAUL). Phenylhydrazine derivatives of Glycuronic acid	i, 204
CLOWES (G. H. A.) and BERNHARD TOLLENS. Formaldehyde or Methylene derivatives of acids belonging to the Sugar Group	i, 205
KOHN (LEOPOLD). Action of Potassium Cyanide on Aliphatic Aldehydes	i, 205
BRUYN (C. A. LOBBY DE) and H. C. BIJL. Isodialdane	i, 205
HORNOSTEL (ERICH VON) and EDUARD O. SIEBNER. Condensation of Glyoxal and Isobutaldehyde	i, 206
BAEYER (ADOLF VON) and VICTOR VILLIGER. Action of Caro's Reagent on Ketones	i, 206
FRANKE (ADOLF) and LEOPOLD KOHN. Isobutylideneacetone and its derivatives	i, 206
WIDTSOR (JOHN A.) and BERNHARD TOLLENS. Arabinose, Xylose, and Fucose from Tragacanth	i, 207
BOUVAULT (LOUIS). Complete synthesis of the Phorone derived from Camphoric acid	i, 207
MARCKWALD (WILHELM) and ALEX. MCKENZIE. Resolution of Racemic compounds into Active Components	i, 207
BRUYN (C. A. LOBBY DE) and WILLIAM ALBERDA VAN EKENSTEIN. <i>d</i> -Sorbino- and <i>l</i> -Sorbino- (ψ -Tagatose) and their Configurations	i, 208
GILLOT (H.). Inverting Power of Tartaric, Citric, and Oxalic acids on Sucrose	i, 208
VOTOČEK (EMIL) and J. ŠEBOR. Arabic acid from Beetroots	i, 208
STOLLE (F.). Caramel substances	i, 209
MAMLOCK (LEONARD) and RICHARD WOLFFENSTEIN. Action of Hydrogen Peroxide on Aliphatic Amines	i, 209

	PAGE
KURNAKOFF (NICOLAI A.). Ethylenediamine compounds of Nickel . . .	i, 209
KURNAKOFF (NICOLAI A.) and N. J. GWOSDAREFF. Ethylenediamine compounds of Palladium . . .	i, 209
BEHREND (ROBERT) and HERMANN SCHREIBER. Ethyl β -Bromoamino-crotonate . . .	i, 210
TROGER (JULIUS) and ERICH EWEES. α -Dichlorothiopropanamide . . .	i, 210
BRÜHL (JULIUS WILHELM). [Nitrosoalkylurethanes] . . .	i, 210
ZAWIDZKI (JAN VON). Thiocyanocobaltammonium compounds . . .	i, 210
WALLACH (OTTO). Condensation Products of Rubenic acid [Dithio-oxamide] with Aldehydes and Secondary Bases . . .	i, 210
LEIDIÉ (ÉMILE). Rhodicyanides . . .	i, 212
FRANKE (ADOLF). Transformation of Bisisopropylazimethylene [Isobut-aldazine] into 4:4-Dimethyl-5-isopropylpyrazoline . . .	i, 212
THOMAS (VICTOR). Action of Mercury on Methylene Iodide . . .	i, 213
ESTREICHER (TADÉUSZ). Secondary Butylbenzene . . .	i, 213
WEILER (MAX). Explanation of the Würtz-Fittig Synthesis. IV. Bromomesitylene and Sodium: Mesityl Bromide and Sodium . . .	i, 213
PINNOW (JOHANNES). Acetylation with Acetic Anhydride in Aqueous Solution . . .	i, 214
MINUNNI (GAETANO). Etherification in Presence of Pyridine . . .	i, 214
ROMBURGH (PIETER VAN). Nitration of Dimethylaniline dissolved in Concentrated Sulphuric acid . . .	i, 214
MICHAELIS (AUGUST) and P. SCHINDLER. Action of Thionyl Chloride on Dimethylaniline and Diethylaniline . . .	i, 215
WEDERKIND (EDGAR). Stereochemical Observations on the Reaction between Picric Chloride and Aromatic Amines . . .	i, 216
BAMBERGER (EUGEN) and JENS MÜLLER. Nitrosoamines of Methylated Nitroanilines . . .	i, 217
SCHOLL (ROLAND) and F. KACER. Relation of Fulminic to Isocyanic acid, and the formation of Phenylurethane from Phenol and Mercuric Fulminate . . .	i, 218
RANSOM (JAMES H.). Molecular Rearrangement of <i>o</i> -Aminophenyl Ethyl Carbonate to α -Hydroxyphenylurethane . . .	i, 218
BAMBERGER (EUGEN). Oxidation of Aqueous Solutions of Aromatic Hydroxylamines by Atmospheric Oxygen . . .	i, 220
BAMBERGER (EUGEN) and FRIEDRICH BRADY. Action of Alkalies on Aromatic Hydroxylamines . . .	i, 221
ANGELI (ANGELO) and FRANCESCO ANGELICO. Aromatic Nitro-derivatives . . .	i, 221
EINHORN (ALFRED) and HERMANN PFEIFFER. Action of Sodium and Amyl Alcohol on Phenylaminoacetic acid . . .	i, 221
EINHORN (ALFRED) and HERMANN PFEIFFER. Benzylbutylamines . . .	i, 222
MEYER (JACOB) and MARTIN ROHMER. Action of Formaldehyde on <i>o</i> -Nitroaniline . . .	i, 222
FISCHER (EMIL) and ADOLF WINDAUS. Formation of Quaternary Ammonium compounds in the case of Homologues of Aniline . . .	i, 224
BODROUX (F.). Transformation of Phenyl, <i>p</i> -Tolyl, and Thymyl Acetates into the corresponding Benzoates . . .	i, 224
KOHNER (EMIL). Synthetical Preparation of Iretol and allied Phentetrol derivatives . . .	i, 224
DITZ (HUGO). Bromination of Phenols . . .	i, 225
ČEŽBLSKY (JAROSLAV). A Condensation Product of Trimethylphloroglucinol . . .	i, 225
BLANKSMA (J. J.). Action of Sodium Mono- and Di-sulphide on Aromatic Nitro-compounds . . .	i, 226
IMBERT (HENRI) and A. ASTRUC. Acidimetry . . .	i, 226
TROGER (JULIUS). Action of Ethyl Acetoacetate and Substituted Acetoacetates on <i>p</i> -Aminobenzoic acid in Presence and Absence of Pyridine . . .	i, 226
EINHORN (ALFRED). Reduction of Benzylaminecarboxylic acids [Aminophenylacetic acids] . . .	i, 227
EINHORN (ALFRED) and CARL LADISCH. Reduction of <i>p</i> -Benzylaminecarboxylic acid [<i>p</i> -Aminophenylacetic acid] . . .	i, 227

	PAGE
EINHORN (ALFRED) and STAVROS C. PAPASTAVROS. Reduction of <i>p</i> -Diethylbenzylaminocarboxylic [<i>p</i> -Diethylaminophenylacetic] acid	i, 228
WALLACH (OTTO). Phenylisobutyric and Tolylisobutyric acids	i, 229
BREDT (JULIUS) and H. HOF. Chlorylphthalimide and Bromylphthalimide and their Conversion into Isatoic Anhydride and Acetylanthranil	i, 229
BEIJERINCK (MARTINUS WILLEM). Formation of Indigo from Woad (<i>Isatis tinctoria</i>)	i, 230
ROMBURGH (PIETER VAN). Formation of Indigo from <i>Indigofera</i> and from <i>Marsdenia tinctoria</i>	i, 230
HENTSCHEL (W.). Fusion of Indigotin with Potassium Hydroxide	i, 231
HÖNIG (MAX). Salts of Indigotintrisulphonic acid	i, 231
SIMONIS (HUGO) and G. WENZEL. Tribromocoumarin and its derivatives	i, 231
GABRIEL (SIEGMUND) and JAMES COLMAN. Constitution of Naphthoylbenzoic acid, Naphthanthraquinone, and Naphthanthracene	i, 232
PSCHORR (ROBERT), O. WOLFFES, and W. BUCKOW. Syntheses in the Phenanthrene Series: Synthesis of 1- and 3-Methoxyphenanthrenes	i, 232
PSCHORR (ROBERT). Synthesis in the Phenanthrene Series: ψ -Thebaol	i, 233
STOLLÉ (ROBERT). Hydrogenisation of Ethyl Succinylsuccinate	i, 234
WIDMAN (OSKAR). Usnic acid	i, 235
LIEBERMANN (CARL), P. HÖRING, and FRITZ WIEDERMANN [and, in part, MESSINGER and I. FRÄNCKEL]. Derivatives of Carminic acid	i, 236
OECHSNER DE CONINCK (WILLIAM). Allotropy of Benzophenone	i, 236
MINUNNI (GAETANO). Dibenzylideneacetoneoxime	i, 237
MINUNNI (GAETANO) and C. CARTA-SATTA. Action of Hydroxylamine Hydrochloride on Ketones of the type $\text{CO}(\text{CH}:\text{CHR})_2$ in presence of Sodium Acetate	i, 237
HARPE (B. VON) and STANISLAUS VON KOSTANECKI. 3:3'-Dihydroxyflavone	i, 237
KOSTANECKI (STANISLAUS VON) and TH. SCHMIDT. 2:3':4'-Trihydroxyflavone	i, 238
KOSTANECKI (STANISLAUS VON) and JOSEF TAMBOR [with J. BONGARTZ]. Formation of Flavone from its Decomposition Products	i, 239
VAILLANT (VICTOR). Action of Hydroxylamine and Phenylhydrazine on Dithiobenzoylacetone	i, 239
KLAGES (AUGUST). Conversion of Dihydrocarvone into Carvenone by means of Formic acid	i, 239
BLANC (G.). Amines containing the Camphor nucleus	i, 239
ROOZEBOOM (HENDRIK WILLEM BAKHUIS). Nature of Inactive Carvoxime	i, 240
SEMMLER (FRIEDRICH WILHELM). Tanacetone and its derivatives	i, 240
WALLACH (OTTO) [with EDGARD NEUMANN and WILHELM VON WESTPHALEN]. Compounds of the Fenchone series	i, 241
WALLACH (OTTO) [and A. SCHÄFER]. Oxidation of Pinene	i, 241
CHARABOT (EUGÈNE). Genesis of Terpenes in Lavender	i, 241
JEANCARD and SATIE. Essence of Geranium	i, 242
GUERRET (M.). Composition of East Indian Essence of Sandalwood	i, 242
BOORSMA (S. E.). Curangin, the Glucoside of <i>Curanga amara</i>	i, 243
BRIEGER (LUDWIG). Arrow Poison of Wakamba (German East Africa).	i, 243
MARCHLEWSKI (LEO). Chlorophyll	i, 243

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
Bunsen Memorial Lecture. By Sir HENRY ROSCOE, B.A., Ph.D., D.C.L., LL.D., D.Sc., F.R.S., Hon. M.D. (Heidelberg), Corresponding Member of the French Academy of Science, Emeritus Professor of Chemistry in Victoria University, Vice-Chancellor of the University of London	513
Annual General Meeting	555
Obituary Notices	591
L.—Electrolysis of the Nitrogen Hydrides and of Hydroxyl- amine. By EMERIQUE CHARLES SZARVASY, Ph.D.	603
LI.—Constitution of Amarine, of its supposed Dialkyl- and Diacyl-derivatives, and of Isamarine. By FRANCIS R. JAPP, F.R.S., and JAMES MOIR, M.A., B.Sc.	608
LII.—Vapour Density of Dried Mercurous Chloride. By H. BREERETON BAKER, M.A.	646
LIII.—Preparation of Pure Hydrobromic Acid. By ALEXANDER SCOTT	648
LIV.—A New Sulphide of Arsenic. By ALEXANDER SCOTT	651
LV.—Researches on the Alkyl-substituted Succinic Acids. Part II. <i>s</i> -Dipropyl, <i>s</i> -Diisopropyl, and <i>aa</i> ₁ -Propylisopropyl- succinic Acids. By WILLIAM A. BONE and CHARLES H. G. SPRANKLING	654
LVI.—The Interaction between Sulphites and Nitrites. By EDWARD DIVERS and TAMEMASA HAGA	
LVII.—Presence of Invertase in some Plants of the <i>Gramineæ</i> . Part I. By JAMES O'SULLIVAN	691
LVIII.—Mannogalactan and Lævulomannan. Two New Poly- saccharides. By JULIAN LEVETT BAKER and THOMAS HENRY POPE	696
LIX.—The Dissociation Constant of Azoimide (Hydrazoic Acid). By CHARLES ALFRED WEST, Assoc.R.C.S.	705
LX.—New Glucoside from Willow Bark. By HOOPER ALBERT DICKINSON JOWETT, D.Sc.	707
LXI.—Bromination of Benzeneazophenol. By J. T. HEWITT and W. G. ASTON	712

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
TISTSCHENKO (WETSCHIASLAW È.) [with A. GABOUNIA, M. G. KISSELEFF, N. MARAZOUEFF, and N. N. PUSHIN]. Action of Amalgamated Aluminium on alcohols. Aluminium Alkylloxides	i, 269
NAGEL (ISKAR). Rancidity of Fats	i, 271
GEITEL (ADOLF C.) and G. VAN DER WANT. Japan Wax	i, 271
VANDEVELDE (ALB. J. J.). Substituted Dibasic acids. Conversion of an acid Chloride into an Anhydride by the action of Haloid acids	i, 272
ROSENHEIM (ARTHUR) and HERMANN ITZIG. Some Complex salts of Tartaric and Malic acids and their Specific Rotatory Power. II.	i, 272
DENIGÈS (GEORGES). Formation of Crystalline Manganese Oxalate by the Oxidation of Citric acid with Potassium Permanganate	i, 274
WOLF (C. G. L.). Melting Point of Chloral Hydrate	i, 274
KOHN (LEOPOLD). Molecular Weight of the Aldols	i, 274
PAULY (HERMANN) and HANS LIECK. Mesityl Oxide	i, 274
TIEMANN (FERDINAND). Methyl-2-heptene-4-one-6 and the synthesis of an Aliphatic Isogermanic acid	i, 275
HOFFER (HANS). Electro-synthesis of Diketones and Ketones	i, 275
GACH (FRIEDRICH). Acetylacetone	i, 276
JESSER (LEOPOLD). Determination of the Reducing Power of Raw Sugar	i, 276
STOLLE (F.). Is the Diminution of the Rate of Inversion caused by the Presence of Normal salts of Inverting acids due to the Formation of Esters?	i, 277
SCHWEITZER (RUDOLF). Colouring Matters contained in "Sugar Colours" and their Detection	i, 277
KIJNER (NIC. M.). Action of Silver Oxide and of Hydroxylamine on Bromoamines	i, 277
HOEHNEL (M.). Halogen derivatives of Hexamethylenetetramine (Urotropine)	i, 279

ERRATA.

VOL. LXXXVI. (ABSTR., 1899).

PART I.

Page	Line	
798	3*	for "Phenylfurfurylamine" read "Phenylfurfurylcarbinyllamine."

PART II.

8	18*	„ "saumontite" read "laumontite."
545	{ 9 14 }	„ "nitrogen" read "nitric oxide."

VOL. LXXXVII. (TRANS., 1900).

437	22	„ "1870" read "1871."
444	9*	
446	4 }	„ "nitrite" read "nitrogen."

* From bottom.

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
LXII.—Decomposition of Chlorates. Part II. Lead Chlorate. By WILLIAM H. SODEAU, B.Sc.	717
LXIII.—Action of Iodine on Alkalis. By ROBERT LLEWELLYN TAYLOR	725
LXIV.—Alkylation by means of Dry Silver Oxide and Alkyl Halides. By GEORGE DRUCE LANDER, D.Sc.	729
LXV.—Hydrosulphides, Sulphides, and Polysulphides of Potassium and Sodium. By W. POPPLEWELL BLOXAM, B.Sc. . . .	753

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

MICHAEL (ARTHUR). Certain Laws and their Application in Organic Chemistry	i, 321
WOLKOFF (ALESEI A.) and BORIS N. MENSCHUTKIN. Preparation of Saturated Hydrocarbons	i, 321
BRUSSOFF (S.). Velocity of Formation of Olefines	i, 322
MATHEWS (JOHN ALEXANDER). Laboratory Method for the Continuous and Uniform Generation of Acetylene	i, 323
MATHEWS (JOHN A.) and L. L. WATTERS. Gold Carbide	i, 323
LEFEBVRE (P.). Action of Amyl Chloride on Calcium Carbide	i, 323
KONOWALOFF (MICHAEL I.) and W. PLOTNIKOFF. Compounds of Aluminium Haloid Salts with Organic and Inorganic Substances. II.	i, 323

	PAGE
BERTHELOT (MARCELLIN) and MARCEL DELÉPINE. Iodide of Cuprous Acetylides	i, 324
KONOWALOFF (MICHAEL I.) [with A. JEBENKO and S. KOTSINA]. Nitration of Menthane and of Triethylmethane	i, 324
KONOWALOFF (MICHAEL I.). Salts of Nitro-compounds with Nitrated Bases. Separation of Nitro-compounds of different Types	i, 324
MAXIMOVITSCH (STEPHAN). Quinquevalent Alcohol from Methylallyl-carbinol	i, 325
STRÖMHOLM (DANIEL). Sulphine and Thetine derivatives	i, 325
VANZETTI (L.). Attempts to obtain Optical Antipodes of Quadrivalent Sulphur derivatives	i, 327
COJAZZI (F.). Energy of some Hydroxy-sulphonic acids	i, 327
ZERNOFF (W.). Iodation of Fatty acids	i, 327
POKRÓVSKY (ARISTARCH). β -Methylethylhydracrylic acid and β -Methylethylacrylic acid	i, 328
TALANZEFF (ZINOVY). β -Methyltertbutylhydracrylic acid	i, 328
BAEYER (ADOLF VON) and VICTOR VILLIGER. Action of Caro's Reagent on Ketones	i, 328
BLANC (G.). Constitution of <i>iso</i> -Lauronic acid	i, 329
BLAISE (EDMOND E.). β -Hydroxy- $\alpha\alpha\beta$ -trimethyladipic acid	i, 329
BULLNHEIMER (FRIEDRICH) and E. SEITZ. Alkali Copper Tartrates and Fehling's Solution. II.	i, 330
TIEMANN ([JOHANN CARL WILHELM] FERDINAND) [with MAX KERSCHEBAUM]. Stereoisomeric forms of Citral	i, 331
HARRIES (CARL D.). Citronellalacetal	i, 331
PERRIER (GUSTAVE). Function of Aluminium Chloride in the Friedel-Craft's Reaction	i, 331
SCHMIDT (JULIUS). Electrolytic Oxidation of Ketoximes. New Method of preparing Aliphatic Nitroso-compounds	i, 332
VOTOČEK (EMIL). Rhodose, a new Sugar of the Methylpentose Series	i, 332
BRUYN (C. A. LOBBY DE) and WILLIAM ALBERDA VAN EKENSTEIN. <i>d</i> -Sorbosose and <i>l</i> -Sorbosose (ψ -Tagatose) and their Configuration	i, 332
PONSOT (A.). Cryoscopy of Tanret's Rhamninose and Rhamninotronic Acid	i, 333
STOLLE (F.). Solubility of Salts of Calcium, Iron, and Copper in Sucrose solutions	i, 333
KIJNER (NIC. M.). Action of Silver Oxide, and of Hydroxylamine, on Bromo-amines	i, 333
MUSSELIUS (L.). Acetylation of Primary and Secondary Amines	i, 334
MENSCHUTKIN (NICOLAI A.). Reaction for distinguishing differently substituted Amines	i, 335
MENSCHUTKIN (NICOLAI A.). Influence of the Side Chain on the properties of Open and Closed Chain compounds. V. Velocity of combination of Secondary Amines with Alkyl Bromides	i, 335
ESCH (WERNER) and WILHELM MARCKWALD. Ethylenetrimethylenediamine and Methylpiperazine	i, 336
MARCKWALD (WILHELM). Dimethylenimine	i, 336
KUDERNATSCHE (RICHARD). Hexethylidenetetramine	i, 337
MENSCHUTKIN (NICOLAI A.). Structure of Acid Amides	i, 337
SCHOLL (ROLAND) and WILHELM NÖRR. Action of Chlorine Monoxide on Benzene	i, 337
FELS (G.). Isomorphous Replacement of Halogens and Hydroxyl	i, 338
WILLGERODT (CONRAD) and VINCENT ALLEN HOWELLS. <i>as</i> -Iodoso-, iodoxy-, and iodonium-compounds derived from <i>m</i> -Xylene	i, 338
WILLGERODT (CONRAD). Preparation of Iodoso- and Iodoxy-compounds	i, 339
ALLEN (RICHARD WILLIAM). Naphthalene Vapour in Coal Gas	i, 339
CHILKOTTI (ALBERTO). Refraction of Hydrocarbons with Condensed Benzene Nuclei	i, 339
BÉNECH (ÉLOPHE). Action of Phenylcarbimide and Phenylthiocarbimide on Dibasic acids	i, 340
STIEGLITZ (JULIUS) and RALPH H. MCKEE. Oxygen Ethers of Carbamides. Methylisocarbamide	i, 340

	PAGE
MENSCHUTKIN (NICOLAI A.). Influence of the Side Chain on the properties of Open and Closed Chain Carbon compounds. VI. Influence of chemically indifferent Solvents on the distribution of the velocity of reaction in Isomeric Benzene derivatives	i, 341
BAMBERGER (EUGEN) [and in part MARIE BAUM, L'ORSA, ARMAND STIEGELMANN, and FRED. TSCHIRNER]. Action of Formaldehyde on β -Aromatic Hydroxylamines	i, 341
BAMBERGER (EUGEN) and FRED. TSCHIRNER. Action of Diazomethane on β -Aromatic Hydroxylamines	i, 342
BREUKELVEEN (M. VAN). Crystalline compounds of Succinimide and the Phenols	i, 343
KÖTZ (ARTHUR) [with SEVIN]. Xylylene Hydrosulphides	i, 343
GEORGESCU (M.). Aromatic Esters of Sulphurous acid	i, 343
MOSCHNER (J.). Hydrindene, and a new Hydroxyhydrindene	i, 344
WOLF (C. G. L.). Melting Point of Ethyl Formylphenylacetate	i, 345
BISOHOFF (CARL ADAM). Formation of Chains. XLII. Phenoxypropionic acids and their derivatives	i, 345
BISOHOFF (CARL ADAM). Formation of Chains. XLIII. α -Phenoxybutyric, α -isobutyric, and α -isovaleric acids and their Esters	i, 345
KLEY (P.). Crystalline Formation of Indigotin	i, 346
WISLICENUS (WILHELM). Ethyl Fluoreneoxalate and Indeneoxalate	i, 346
THEILE (JOHANNES). Condensation Products of Indene and Fluorene	i, 347
HENZE (MARTIN). Condensation of Benzyl Cyanide and Ethyl Fumarate	i, 347
WIDMAN (OSKAR). Usnic acid	i, 347
STEFANI (PIO DE). Attempts to obtain active Isomerides of Hexahydro- and α -Hexahydro-mellitic acids	i, 349
BOESSEN (J.). Friedel and Craft's Reaction	i, 349
NEF (JOHN ULRIC). Alkylation of Ketones	i, 349
PETRENKO-KRITSCHENKO (PAVEL IW.) and P. KARANIEZKY. Ketoximes	i, 350
PERRIER (GUSTAVE). Anthraphenones	i, 350
COHN (PAUL). Action of Menthol on Ethyl Acetoacetate	i, 350
COHN (PAUL) and SIEGFRIED TAUSS. Menthyl Acetoacetate	i, 350
SEMMLER (FRIEDRICH WILHELM). Borneol and Isoborneol	i, 351
GENVRESSE (P.). New Terpenoid alcohol and its derivatives	i, 351
TSCHUGAEFF (L.). Conversion of Carvone into Limonene	i, 352
KONOWALOFF (MICHAEL I.). Preparation of Camphene and Menthene from the corresponding alcohols	i, 352
PERRIER (GUSTAVE). Essence of Chrysanthemum	i, 352
KERSCHBAUM (MAX). The Aldehydic constituents of Oil of <i>Verbena</i> . Verbenone	i, 353
WEBER (CARL OTTO). India-rubber	i, 353
VITOČEK (EMIL). Sugars of some Glucosides	i, 353
LIEBERMANN (CARL [THEODOR]). Compounds from Rhubarb and allied substances	i, 355
KOSTANECKI (STANISLAUS VON) and W. FEUERSTEIN. Brazilin	i, 355
GADAMER (JOHANNES). Alkaloids of the <i>Solanaceae</i>	i, 355
SEYEWETZ (ALPHONSE). Combination of Basic with Acidic Colouring Matters	i, 356
BOCCHI (O.). Action of Bromoform and Chloroform on some Pyrroles	i, 357
PAULY (HERMANN) and CARL BOEHM. Action of Amines on Dibromotriacetanamine	i, 357
GABRIEL (SIEGMUND) and JAMES COLMAN. Action of the Sodium Alkyl-oxides on Ethyl Phthalylaminoacetate and its Homologues	i, 358
GABRIEL (SIEGMUND) and JAMES COLMAN. 4-Hydroxyisocarbostyryl	i, 359
BRUNNER (KARL). Synthesis of Indoline Bases	i, 360
ULLMANN (FRITZ) and E. NAEF. Syntheses in the Acridine Series. I. 2'-Methyl-1:2-naphthacridine	i, 360
ULLMANN (FRITZ) and E. NAEF. Syntheses in the Acridine Series. II. 3'-Amino-2'-methyl-1:2-naphthacridine	i, 361
BOTGAULT (J.). Compounds of Iodoantipyrine with Mercuric salts	i, 361

	PAGE
VILLE (JULES) and CHARLES ASTRE. New compounds of Mercuric Chloride and Antipyrine	i, 362
SACHS (FRANZ). Condensation of Aromatic Nitroso-compounds with Methylene derivatives	i, 362
CENSI (J.). Action of Methyl Chloroacetate on Tertiary Bases	i, 363
WEDEL (JEAN). Interaction of Hydrazine Hydrate with certain Lactones	i, 363
TAMBORE (JOSEF [with ERNST and LIOŃSKI]). Indogenides of the Pyrazole Series	i, 364
HÄUSSERMAN (CARL). Tertiary Aromatic Amines. III.	i, 365
HANTZSCH (ARTHUR [RUDOLF]). Salts and Bases of Triphenylmethane Dyes	i, 365
FICHTER (FRITZ) and EMANUEL SCHIESS. Colouring Matters of the Form-azyl Group	i, 366
BEUTEL (ERNST). Tolyldiguanides and Benzylidiguanides	i, 367
MÖHLAU (RICHARD) and W. SCHAPOSHNIKOFF. Action of Tetramethyldiaminobenzhydrol on Rosinduline and Isorosinduline	i, 367
GOLDSCHMIDT (HEINRICH) and GUSTAV KEPPELER. Dynamical Researches on the Formation of Azo-dyes. IV.	
MÖHLAU (RICHARD) and ERICH STROHBACH. Abel's Dibenzeneazo- β -dinaphtholmethane and Dinitroso- β -dinaphtholmethane	i, 368
ABEL (JOHN J.). Phenylcarbamie Ester of Epinephrine	i, 368
PARTHEIL (ALFRED) and A. GRONOVER. Action of Triethylphosphine on <i>ortho</i> -Dibromo- <i>o</i> -xylene	i, 368

PART II.

General and Physical Chemistry.

BERTHELOT (MARCELLIN PIERRE EUGENE). Chemical Action of Light contrasted with that of the Silent Discharge	ii, 329
SIERTSEMA (L. H.). Influence of Pressure on the rotation of Sucrose	ii, 329
EDER (JOSEF M.) and EDUARD VALENTA. Spectrum of Bromine	ii, 330
BARY (PAUL). Fluorescence of Metallic compounds under the Influence of the Röntgen Rays and Becquerel Rays	ii, 330
SMITH (S. W. J.). Nature of Electrocapillary Phenomena. I. Their relation to the Potential Differences between Solutions	ii, 330
TOWER (OLIN FREEMAN). Potential Differences with Manganese Dioxide Electrodes	ii, 331
CALVERT (HARRY THORNTON). Dielectric Constant of Hydrogen Peroxide	ii, 331
OKER-BLOM (MAX). Effect of Suspended Particles on Conductivity	ii, 331
MASSOULIER (P.). Electrolytic Conductivity and Internal Friction in Saline Solutions	ii, 331
ŠULC (OTTO KAR). Conductivity of some Sodium derivatives of Nitro-paraffins	ii, 332
MACGREGOR (JAMES G.). Finding the Ionisation of Complex Solutions of given Concentration, and the Converse Problem	ii, 332
BARNES (JAMES). Conductivity, Specific Gravity, and Surface Tension of Aqueous Solutions containing Potassium Chloride and Sulphate	ii, 332
GOCKEL (ALBERT). Electrolytic Decomposition Point of Aqueous Solutions	ii, 332
LORENZ (RICHARD) [with A. HELFENSTEIN]. Electrolysis of Fused salts	ii, 333
DU BOIS (H.) and OTTO LIEBKNECHT. Molecular Susceptibility of the salts of the Rare Earths	ii, 333

	PAGE
LEES (CHARLES H.). Thermal Conductivities of Mixtures and of their Constituents	ii, 333
MELLOR (J. W.). Bunsen's Ice Calorimeter	ii, 334
BERTHELOT (MARCELLIN) and MARCEL DELÉPINE. Heat of Combustion of very Volatile Liquids	ii, 334
LUGININ (WLADIMIR F.). Heat of Vaporisation of Nitriles and other Organic compounds	ii, 334
LOOMIS (ELMER HOWARD). Freezing Point of Aqueous Solutions of Non-electrolytes	ii, 335
EMERY (J. A.) and FRANK K. CAMERON. Freezing Point Curves for Water containing Hydrogen Chloride and Phenol	ii, 335
BERTHELOT (DANIEL). Minimum Volume of Liquids	ii, 335
VANDENBERGHE (AD.). Dissociation of Dissolved Substances. I.	ii, 335
HOSKING (R.). Viscosity of Solutions	ii, 336
ROSSET (G.). Drop Methods for the Determination of Molecular Weights	ii, 336
BERTHELOT (DANIEL). Molecular Association in Liquids	ii, 337
PONSOT (A.). Chemical Reactions in Solution: Vapour Tension of the Solvent	ii, 337
HERZ (W.). Equilibrium in the Partition of an Acid between Zinc Hydroxide and Ammonia	ii, 337
LÖWENHERZ (RICHARD). Decomposition by Sodium of Organic Halogen compounds dissolved in Amyl alcohol	ii, 338
BEEMELÉN (JACOBUS M. VAN) and EDUARD A. KLOBBE. Absorption of Hydrogen Chloride and Potassium Chloride from Aqueous Solution by Colloidal Stannic Oxide	ii, 338
DUHEM (PIERRE). Emission and Absorption of Water Vapour by Colloidal matter	ii, 338
TOMMASI (DONATO). Metallic Crystallisation by Electric Currents	ii, 339
HISSINK (D. J.). Formation and Transition of Mixed Crystals of Sodium and Potassium Nitrates, and of Sodium and Silver Nitrates	ii, 339
SCHENCK (RUDOLF). [Crystalline Liquids]	ii, 339
CLARKE (FRANK WIGGLESWORTH). Report of the [American] Committee on Atomic Weights	ii, 339
EMICH (FRIEDRICH) and FRIEDRICH DÖRNER. Lecture Experiment on the Law of Multiple Proportions	ii, 340
RIBAN (JOSEPH). New Gasometer of Constant Pressure, adjustable at will	ii, 340

Inorganic Chemistry.

VORLÄNDER (DANIEL) and RUDOLF VON SCHILLING. Preparation and Properties of Anhydrous Perchloric acid	ii, 340
ARONSTEIN (LOUIS) and S. H. MEIHZUZEN. Molecular Weight of Sulphur as determined by the Boiling Point method	ii, 341
MOISSAN (HENRI) and PAUL LEBEAU. Sulphur Perfluoride, a New Gas	ii, 341
MOISSAN (HENRI) and PAUL LEBEAU. Density and Analysis of Sulphur Perfluoride	ii, 342
SCHLAGDENHAUFFEN (CHARLES F.) and C. PAGEL. Sulphuric acid containing Selenium	ii, 342
RAYLEIGH (JOHN WILLIAM STRUTT [BARON]). Passage of Argon through thin films of India-rubber	ii, 342
FOERSTER (FRITZ) and F. JORRE. Electrolysis of Alkali Chloride Solutions with a Diaphragm	ii, 343
SCHULTEN (AUGUST BENJAMIN [BARON] DE). Production of Iodated Potassium and Sodium Carnallites	ii, 343
CORDIER (V. VON). Action of Chlorine on Metallic Silver in the Light and in the Dark	ii, 343
GEELMUYDEN (H. CHR.). Reducing Action of Calcium Carbide	ii, 344
FORCRAND (ROBERT DE). Hydrated Barium Peroxide	ii, 344

	PAGE
FORCRAND (ROBERT DE). Heat of Formation of Hydrated and Anhydrous Strontium Dioxide	ii, 344
CAVEN (ROBERT MARTIN). Reaction of Magnesium, Zinc, and Iron with Solutions of Cupric Sulphate	ii, 344
SCHIRBER (W.). Influence of Ammonia on Magnesium Salts	ii, 345
MORGAN (J. LIVINGSTON R.). Electrolytic Deposition of Brass	ii, 345
FONZES-DIACON (HENRI). Zinc Selenide and its Dimorphism	ii, 345
SCHULTEN (AUGUST BENJAMIN [BARON] DE). Production of Cadmium Vanadinites	ii, 346
PÉLABON (H.). Action of Hydrogen on Mercury Selenide, and the Inverse Action	ii, 346
FRANÇOIS (MAURICE). Formation of Mercuriammonium Iodide by the Regulated Action of Concentrated Ammonia on Mercuridiammonium Iodide	ii, 346
URBAIN (G.). Separation of the Rare Earths	ii, 346
CHAVASTELON (R.). Separation of the Rare Earths	ii, 346
DEMARÇAY (EUGÈNE). New Method of Fractionating some Rare Earths	ii, 347
PÉIBRAM (RICHARD). Austrium	ii, 347
ZUNINO (V.). New Hydrate of Alumina	ii, 348
GIORGIS (GIOVANNI) and UGO ALVISI. Natural and Artificial Pozzuolana	ii, 348
FONZES-DIACON (HENRI). A Crystallised Selenide and an Oxy-selenide of Manganese	ii, 348
BREUKELEVEEN (M. VAN) and A. TER HORST. Iron Carbonyls and their Importance in the Industrial Applications of Water Gas	ii, 349
SCHARIZER (RUDOLF). Constitution and Genesis of Iron Sulphates	ii, 349
GRANGER (ALBERT) and GASTON DIDIER. Nickalous Arsenide	ii, 349
LENHER (VICTOR) and HERMANN A. LOOS. Decomposition of Nickel Carbonyl in Solution	ii, 349
VENABLE (FRANCIS PRESTON). Nature of the Change from Violet to Green in Solutions of Chromium salts	ii, 349
BAUGÉ (GEORGES). Double Carbonates of Chromium Oxide: Saline Oxide of Chromium	ii, 349
PAGEL (C.J.). Preparation of Double Sulphates of Chromium	ii, 349
DEFACQZ (ED.). Tungsten Diphosphide	ii, 350
HALLOPEAU (L. A.). Paratungstates	ii, 350
DEBIERNE (A.). Actinium: a new Radio-active Element	ii, 350
ROSENHEIM (ARTHUR) and JOHANNES SCHILLING. Thorium salts	ii, 351
RUTHERFORD (E.). A Radio-active Substance emitted from Thorium compounds	ii, 351
RUTHERFORD (E.). Radio-activity produced in substances by the action of Thorium compounds	ii, 352
PÉLABON (H.). Action of Hydrogen on Antimony Sulphide	ii, 352
SCHULTEN (AUGUST BENJAMIN [BARON] DE). Crystallised Bismuth salts	ii, 353

Mineralogical Chemistry.

EICHLEITER (C. FRIEDRICH). Coals, Bitumen, &c., from the Silurian of Bohemia	ii, 354
JEREMÉEFF (PAVEL V. VON). Carnassite from the Altai	ii, 354
JEREMÉEFF (PAVEL V. VON). Pseudomorphs after Olivine from the Urals	ii, 354
TARASSENKO (W.). Composition of Plagioclase	ii, 354
PRESTON (H. L.). Two new American Meteorites	ii, 355
BOURCET (PAUL). Water from Jouhe, near Dôle (Jura)	ii, 355

Physiological Chemistry.

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
LXV.—Hydrosulphides, Sulphides, and Polysulphides of Potassium and Sodium. By W. POPPLEWELL BLOXAM, B.Sc. (Continued)	769
LXVI.—Chlorine Derivatives of Pyridine. Part VI. Orientation of some Chloraminopyridines. By W. J. SELL, M.A., F.R.S., and F. W. DOORSON, M.A.	771
LXVII.—Note on Partially Miscible Aqueous Inorganic Solutions. By G. S. NEWTH	775
LXVIII.—Racemic and Optically Active Forms of Amarine. By H. LLOYD SNAPE, D.Sc., Ph.D.	778
LXIX.—Substituted Nitrogen Chlorides and Bromides derived from <i>o</i> - and <i>p</i> -Acetotoluidide. By F. D. CHATTAWAY and K. J. P. ORTON	789
LXX.—Ortho-substituted Nitrogen Chlorides and Bromides and the Entrance of Halogen into the Ortho-position in the Transformation of Nitrogen Chlorides. By F. D. CHATTAWAY and K. J. P. ORTON	797
LXXI.—Nitrogen Chlorides derivable from <i>m</i> -Chloroacetanilide and their Transformation. By F. D. CHATTAWAY, K. J. P. ORTON, and W. H. HURLEY	800
LXXII.—Condensation of Ethyl Acetylenedicarboxylate with Bases and β -Ketonic Esters. By SIEGFRIED RUHEMANN and H. E. STAPLETON, B.A., Scholar of St. John's College, Oxford	804
LXXIII.—Bromination of Benzeneazophenol. Part II. By JOHN THEODORE HEWITT and WILLIAM GEORGE ASTON	810

	PAGE
LXXIV.—Action of Formaldehyde on Amines of the Naphthalene Series. Part II. By GILBERT THOMAS MORGAN, D.Sc.	814
LXXV.—Estimation of Hypiodites and Iodates and the Reaction of Iodine Monochloride with Alkalis. By K. J. P. ORTON and W. L. BLACKMAN	830
LXXVI.—Researches on Silicon Compounds. Part VI. On Silicodiphenyldiimide and Silicotriphenylguanidine. By J. EMERSON REYNOLDS, D.Sc., M.D., F.R.S.	836
LXXVII.—A Study of the Absorption Spectra of <i>o</i> -Oxycarbanil and its Alkyl Derivatives in relation to Tautomerism. By WALTER NOEL HARTLEY, F.R.S., JAMES J. DOBBIE, D.Sc., M.A., and PHOTIOS G. PALIATSEAS	839
LXXVIII.—Ultra-violet Absorption Spectra of Some Closed Chain Carbon Compounds. Part II. Dimethylpyrazine, Hexamethylene, and Tetrahydrobenzene. By WALTER NOEL HARTLEY, F.R.S., and JAMES J. DOBBIE, D.Sc., M.A.	846
LXXIX.—The Constitution of Pilocarpine. Part I. By HOOPER ALBERT DICKINSON JOWETT, D.Sc.	851
LXXX.—Isomeric Partially Racemic Salts containing Quinquevalent Nitrogen. Parts I—VI. Hydrindamine Bromocamphorsulphonates, Chlorocamphorsulphonates, and <i>cis</i> - π -Camphanates. By FREDERIC STANLEY KIPPING, Ph.D., D.Sc., F.R.S.	861
LXXXI.—Constitution of Ethyl Sodiocyanacetate and of Ethyl Sodiomethylcyanacetate. By JOCELYN FIELD THORPE	923
LXXXII.— <i>cis</i> - and <i>trans</i> - α,β -Tetramethylglutaric Acids. By JOCELYN F. THORPE and WILLIAM J. YOUNG	936
LXXXIII. β -Isopropylglutaric Acid and <i>cis</i> - and <i>trans</i> -Methylisopropylglutaric Acids. By F. H. HOWLES, JOCELYN F. THORPE, WILLIAM UDALL, and, in part, H. A. NEALE	942
LXXXIV.—The Persulphuric Acids. By T. MARTIN LOWRY, D.Sc., and JOHN H. WEST	950

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
BAYLEY (THOMAS). Relation between Boiling Point and Melting Point in the Hydrocarbons	i, 369
BAUD (E.). Action of Anhydrous Aluminium Chloride on Acetylene	i, 369
POURET (CHARLES). Bromination by means of Aluminium Bromide	i, 369
KÖTZ (ARTHUR). Reactivity of the Hydrogen Atoms in Disulphones, Trisulphones, and Tetrasulphones	i, 369
GABUTTI (EMILIO). Action of Chloral on the Chloroacetic acids	i, 370
VANINO (LUDWIG) and EMIL UHLFELDER. Organic Peroxides. IV.	i, 371
RUPE (HANS). Cineolic acid	i, 371
HALLER (ALBIN). Preparation of Ethyl β -Alkyloxy- α -cyanocrotonates isomeric with Ethyl Cyanoalkylacetoacetates	i, 372
GOLDSCHMIDT (HEINRICH) and LAZAR OSLAN. Ethyl Acetoacetate. II.	i, 373
CLAIREN (LUDWIG) and E. HAASE. Acetylation of Ethyl Acetoacetate	i, 373
MAROH (F.). Action of Ethyl Chloroacetate on Sodioacetylacetone	i, 374
MOLINARI (ETTORE). Conversion of Dimethylmaleic Anhydride into Dimethylfumaric acid	i, 374
FITTING (RUDOLPH). Formation of Oxalacetic acid by Oxidation with Potassium Permanganate in Alkaline Solution	i, 375
BAUDRAN (G.). [Tartar] Emetics	i, 375
PRUNIER (L. LÉON L.). General observation on "Emetics"	i, 376
SCHLOSSBERG (J.). Some Racemic Substances	i, 376
KNOBE (LUDWIG). Preparation of Acetonylacetone	i, 376
GRAY (THOMAS). Syntheses with Acetonylacetone	i, 376
BERTRAND (GABRIEL). Oxidation of Erythritol by the Sorbose Bacterium: Production of Erythrulose, a new Sugar	i, 377
SULAIMAN BEY. Pentoses and Methylpentoses	i, 377
SMITH (ROBERT H.) and BERNHARD TOLLENS. Compounds of Fructose (Lævulose) with the Haloid salts of the Alkaline Earth. Oxidation of Fructose	i, 378
SMITH (ROBERT H.) and BERNHARD TOLLENS. Polarisation and Reducing Power of Sorbose	i, 378
SCHÖNROCK (OTTO). Variation in the Specific Rotation of Sucrose with the Temperature	i, 378
OECHSNER DE CONINCK (WILLIAM). Stability of Sucrose Solutions	i, 378
HILGER (ALBERT) and W. E. DREYFUS. Gum Tragacanth	i, 379
LENHER (VICTOR). Some new Tellurium compounds	i, 379
LACHMAN (ARTHUR). Bewad's Triethylamine Oxide	i, 380
LACHMAN (ARTHUR). Diethylhydroxylamine	i, 380
LACHMAN (ARTHUR). Quinquevalent Nitrogen	i, 380
MIOLATI (ARTURO). Ammonio-cobalt Thiocyanates	i, 381
ROSENHEIM (ARTHUR) and ROBERT COHN. Double Thiocyanates	i, 381

BÜLOW (KARL). Estimation of Absorbable Proteids in Foods	ii, 459
MANKIEWICZ. Sulphosalicylic acid as a Test for Albumin in Urine	ii, 459
JUCKENACK (ADOLF). Examination and Valuation of Commercial Pastry	ii, 460
BEHN (SIGISMUND). Examination of Commercial Pastry	ii, 460

INDEX OF AUTHORS' NAMES.

A.

Abderhalden, E., ii, 416.
 Abegg, R., and W. Herz, ii, 436.
 Albanese, M., ii, 424.
 Albert, R., and E. Buchner, i, 420.
 Amthor, C., ii, 453.
 André, G., ii, 428.
 Ausel, O. See H. von Pechmann.
 Aschan, O., i, 399.
 Aston, W. G. See J. T. Hewitt.
 Astre, C. See J. Ville.
 Atkinson, G. A. S. See E. P. Permann.
 Auwers, K., i, 418.

B.

Barcroft, J., ii, 417.
 Barnstein, F. See O. Kellner.
 Baud, E., i, 369.
 Baudran, G., i, 375.
 Bauer, P. See M. Busch.
 Baxter, G. P. See T. W. Richards.
 Bayley, T., i, 369.
 Beck, C., ii, 448.
 Becquerel, H., ii, 381.
 Beijerinck, M. W., i, 403 ; ii, 425.
 Bein, S., ii, 460.
 Benedict, F. G., ii, 439.
 Benoit, E., ii, 435.
 Berthelot, M., ii, 387.
 Bertiaux, L. See A. Hollard.
 Bertram, J., and J. Helle, i, 398.
 Bertrand, G., i, 377.
 Beythien, A., P. Borisch, and J. Deiter, ii, 455.
 Bignami, C., and G. Testoni, i, 400.
 Binz, A., and A. Hagenbach, ii, 384.
 Binz, A. See also L. Preuss.
 Bischoff, C. A., i, 392, 393, 394, 395, 396.
 Blackman, W. L. See K. J. P. Orton.
 Bock, J., ii, 424.
 Boeggild, O. B., ii, 413, 414.

Böttger, W., ii, 443.
 Bogert, M. T., and A. H. Gotthelf, i, 412.
 Bokorny, T., ii, 426.
 Borisch, P. See A. Beythien.
 Bornträger, H., ii, 439, 444.
 Borsch, W. See K. A. Hofmann.
 Borsche, W., i, 419.
 Bosca, Y Casanoves, E., ii, 415.
 Bouchard, C., and A. Desgrez, ii, 418.
 Bourcet. See A. Charrin.
 Bräutigam, W., ii, 427.
 Brearley, H., ii, 440.
 Brearley, H. See also F. Ibbotson.
 Buchner, E. See R. Albert.
 Bülow, K., ii, 459.
 Busch, M., and P. Bauer, i, 414.
 Busch, M., and E. Lingenbrink, i, 411, 413.
 Byers, H. G. See H. N. Morsa.

C.

Cajola, A., and A. Cappellini, ii, 394.
 Cameron, F. K. See W. H. Krug.

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
LXXXIV.—The Persulphuric Acids. By T. MARTIN LOWRY, D.Sc., and JOHN H. WEST (<i>Continued</i>)	961
LXXXV.—Dimethyldiacetylacetone, Tetramethylpyrone, and Orcinol Derivatives from Diacetylacetone. By J. N. COLLIE, F.R.S., and B. D. STEELE, B.Sc. (Melbourne), 1851 Exhibition Scholar	961
LXXXVI.—Dehydracetic Acid. By J. N. COLLIE, F.R.S.	971
LXXXVII.—Decomposition of Hydroxyamidodisulphates by Copper Sulphate. By EDWARD DIVERS and TAMEMASA HAGA	978
LXXXVIII.—Condensation of Phenols with Esters of the Acetylene Series. Part I. Action of Phenols on Ethyl Phenylpropionate. By SIEGFRIED RUHEMANN and FRED. BEDDOW, D.Sc., Ph.D.	984
LXXXIX.—Estimation of Furfuraldehyde. By WILLIAM CORMACK	990
Friedel Memorial Lecture. By J. M. CRAFTS, Professor	993
XC.—Diphenyl- and Dialphyl-ethylenediamines, and their Nitro-derivatives, Nitrates, and Mercurichlorides. By WILLIAM SLOAN MILLS, B.A., Demonstrator of Chemistry in the Queen's College, Galway	1020
XCI.—Researches on Morphine. Part I. By S. B. SCHRYVER and FREDERIC H. LEES	1024
XCII.—The Oxime of Mesoxamide and some Allied Compounds. By MARTHA ANNIE WHITELEY, B.Sc.	1040
XCIII.—Phenylacetylchloramine and its Analogues. By HENRY E. ARMSTRONG	1047
XCIV.—Derivatives of Cyanocamphor and of Homocamphoric Acid. By ARTHUR LAPWORTH	1053
XCV.—Asymmetric Optically Active Sulphur Compounds. <i>d</i> -Methylethylthetine Platinichloride. By WILLIAM JACKSON POPE and STANLEY JOHN PEACHEY	1072

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
PETRENKO-KRITSCHENKO (PAVEL IW.). Configuration of Saturated Fatty compounds	i, 421
SABATIER (PAUL) and JEAN B. SENDERENS. Hydrogenation of Acetylene in Presence of Copper	i, 421
WITTORF (NICOLAUS M.). Addition of Hypochlorous and Hypobromous acids to Acetylene and to its Monosubstituted derivatives	i, 421
LUBARSKY (EUGÈNE). Hydrocarbon, C_8H_{10} from Dimethylallylcarbinol	i, 422
WOLKOFF (ALESEI A.) and BORIS N. MENSCHUTKIN. Action of Zinc Dust on Trimethylene Bromide	i, 423
CHARON (ERNEST) and PAIX-SÉAILLES. Glycol Monoiodohydrin	i, 423
MAQUENNE (LÉON). Partial Synthesis of <i>l</i> -Erythritol	i, 423
BERTRAND (GABRIEL). Reduction of Erythrulose and Preparation of a New Erythritol; <i>d</i> -Erythritol	i, 424
ZEHENTER (JOSEF). Behaviour of Uranyl Acetate and some of its Double salts towards Water	i, 424
BIILMANN (EINAR) and ALFRED WÖHLK. Methods for the Preparation of Acrylic acid	i, 425
WÖHLK (ALFRED). Acrylic acid from Glycerol	i, 425
BIILMANN (EINAR). Preparation of Acrylic acid from Allyl alcohol	i, 425
LESPIEAU (ROBERT). γ -Chlorocrotonic acid	i, 425
KASANSKY (ALEXANDER). Action of Hydrogen Bromide on Ricinoleic acid and on its Acetyl derivatives	i, 426
FICHTER (FRITZ) and CAMILLE DREYFUS. Behaviour of Dibasic β -Hydroxy-acids on Boiling with Aqueous Sodium Hydroxide	i, 426
DERÔME (JUVÉNAL). Action of Cyanogen Chloride on Ethyl Acetonedicarboxylate	i, 426
THOMAS-MAMERT (RENÉ) and ST. WEIL. Action of Hydrocyanic acid on Ethyl Cetipate	i, 427
PINNER (ADOLF). Compounds of Bromal with Formaldehyde	i, 427
FRANKE (ADOLF). Action of Bromine on Polymeric Aldehydes. I.	i, 427
FRANKE (ADOLF). 2-Methyl-2-bromopropanal [α -Bromo <i>isob</i> utaldehyde]	i, 428
WESSELY (LEO). An Aldol from <i>iso</i> -Butaldehyde and Formaldehyde	i, 428
HENRICH (FERDINAND). The Negative Nature of Unsaturated Groups of Atoms	i, 429
BRAUN (JULIUS VON) and FRITZ STECHELE. Allylacetone	i, 429
LESER (GEORGES). Cyclic β -Diketones. I.	i, 430
WALDEN (PAUL). Double Thiocyanates and Cyanides	i, 430
BRAUN (JULIUS VON). Action of Cyanogen Bromide on Tertiary Amines	i, 430
STIEGLITZ (JULIUS) and RALPH H. MCKER. Methyl <i>isocarb</i> amide	i, 431
BIILMANN (EINAR). Action of Allyl Alcohol and of Ethylene on Mercuric salts	i, 431
WILLGERODT (CONRAD) and HEINRICH ROGGATZ. Iodoso-, Iodoxy-, and Iodonium compounds derived from Iodo- and Chloriodo-mesitylene	i, 432
JACKSON (CHARLES LORING) and F. H. GAZZOLO. Certain Coloured Substances derived from Nitro-compounds	i, 433
MARCKWALD (WILHELM). Alkylation of Indene	i, 434
BAMBERGER (EUGEN) and FRED. TSCHIRNER. Oxidation of Aniline	i, 435
BAMBERGER (EUGEN) and ERNST HOFF. Direct Introduction of Nitro-groups into the Side Chain of Aromatic Amines	i, 435

	PAGE
BAMBERGER (EUGEN) and ERNST HOFF. Dehydration of Amine Nitrates to Nitramines (Diazotic acids)	i, 435
SCHOLL (ROLAND) and WILHELM NÖRR. Action of Cyanogen Bromide on Dimethyl- and Diethyl-aniline	i, 435
WISLIZIENUS (WILHELM) and MAX GOLDSCHMIDT. Molecular Rearrangement of Imino-ethers by Heat	i, 435
SCHOLL (ROLAND) and WILHELM NÖRR. Action of Cyanogen Bromide on Phenol	i, 436
HENRICH (FERDINAND). Nitroso-orscinol	i, 436
GOLDSCHMIDT (CARL). Reactions of Formaldehyde	i, 436
GOLDSCHMIDT (CARL). Action of Formaldehyde on Methylaniline	i, 436
BAEYER (ADOLF VON) and VICTOR VILLIGER. Benzoyl Hydrogen Peroxide. Oxidation of Benzaldehyde in Air	i, 437
WALTHER (REINHOLD VON) and A. WETZLICH. Action of Aldehydes on Phenylacetic acid and Benzyl Cyanide and some of its derivatives with the Formation of Stilbene and Stilbene derivatives	i, 438
EINHORN (ALFRED) [and in part HUGO HÜTZ and BALTHASAR PFYL]. New Drugs [Aromatic Hydroxy-acids and Esters]	i, 439
BISCHOFF (CARL A.) [and in part FRÄNKEL, GOHS, and WENGEL]. Formation of Chains. L. The Three Sodium Nitrophenoxides	i, 442
BISCHOFF (CARL A.) [and in part HERR, JENTSCHMEN, and SBYROTSCHKIN]. Formation of Chains. LI. Chloro- and Bromo-phenols. Summary of Quantitative Results on the Condensation of Phenols	i, 443
LUDEWIG (H.). Catecholacetic acid	i, 443
SEVERIN (ÉMILE C.). Dichlorophthalic acids. Products of Condensation	i, 445
BISCHOFF (CARL ADAM). Formation of Chains. LII. Derivatives of Catechol	i, 445
BISCHOFF (CARL A.) [and in part ABRAMSON, AGROZKIN, and MINSKI]. Formation of Chains. LIII. Derivatives of Resorcinol and Orcinol	i, 446
BISCHOFF (CARL A.) [and in part BASSEWICZ, DUNIN-SULGUSTOWSKI, OLZEWSKI, and STIELMANN]. Formation of Chains. LIV. Derivatives of Quinol	i, 446
MEYER (HANS). Tetrabromophenolphthalein	i, 447
ORNDORFF (WILLIAM R.) and C. E. BREWER. Gallein and Cœrulein	i, 447
BLUMSTEIN (J.) and STANISLAUS VON KOSTANECKI. 6:8'-Dihydroxy-flavone	i, 448
KOSTANECKI (STANISLAUS VON). Oximes of some Flavanones	i, 449
KEHRMANN (FRIEDRICH) and H. WOLFF. 7-Acetylamino- β -naphthaquinone	i, 449
SEVERIN (ÉMILE C.). Preparation of Dialkylaminodichloroanthraquinones	i, 450
NIENTOWSKI (STEFAN VON). New Homologues of Alizarin, Hystazain, and Quinizarin	i, 450
LIEBERMANN (CARL) and C. N. RIIBER. Bromine derivatives of Quinizarin	i, 451
HALLER (ALBIN) and JULES MINGUIN. Action of Hydrogen Bromide on Dextrogyrate Benzylidenecamphor, Bromobenzylcamphor, and Dextrogyrate Benzylidenecampholic and Phenylhydroxyhomocampholic acids	i, 452
BOUVEAULT (LOUIS). Rhodinol and Citronellol	i, 452
BOUVEAULT (LOUIS). Transformation of Rhodinol into Menthone	i, 452
SEMMLER (FRIEDRICH WILHELM). Pseudo- and Ortho-series of Terpenes, Terpene-alcohols, and Terpene-ketones	i, 452
HESSE (ALBERT). Essential Oil of Jasmine Blossom. IV.	i, 454
PRÖSCHER (FR.). Precipitation of Dyes by Ammonium Persulphate	i, 454
COHN (GEORG). Leucomethylene-blue	i, 455
PRUD'HOMME (MAURICE). New Colouring Matters of acid function	i, 455
PRUD'HOMME (MAURICE). New blue Colouring Matters fast to alkalis of special constitution	i, 455
KOHNER (E.). Brilliant Fast Red G	i, 455
PINNER (ADOLF) and E. KOHLHAMMER. Pilocarpine	i, 456
MARCKWALD (WILHELM), W. KLEMM, and H. TRABERT. The Pyridine Series. II.	i, 456

	PAGE
WILLSTÄTTER (RICHARD) and FRITZ IGLAUER. Action of Hypochlorous acid on Tertiary Amines	i, 458
COHN (PAUL) and ARMIN FISCHER. 4-Chloro- <i>m</i> -phenylenediamine	i, 458
THOMAS-MAMEET (RENÉ) and St. WEIL. Condensation of Ethyl Cetipate with <i>o</i> -Diamines. I. Condensation with Ethylenediamine and the Naphthylene- <i>o</i> -diamines	i, 459
FISCHER (OTTO) and EDUARD HEPP [with FRIED. LINNEMANN, ALEXANDER GUTBIER, and WALTHER DILTHER]. Safranin and Rosinduline	i, 460
FISCHER (OTTO) and EDUARD HEPP. Constitution of the Rosinduline of the Aminoazobenzene Fusion	i, 462
KEHRMANN (FRIEDRICH) and H. WOLFF. The Tenth and Eleventh Isomerides of Rosinduline	i, 463
LÖB (WALTHER). Electrolytic preparation of Colouring Matters resembling Indulines	i, 464
SCHALL (CARL). Phenylhydrazone-carbo- and -dicarbo-diimine. The decomposition product of Wessel's Dicarbo-base	i, 464
SONNEBORN (H.). Electrolytic reduction of <i>p</i> -Nitraniline	i, 464
CAZENEUVE (PAUL). Metallic compounds of Diphenylcarbazon	i, 465
CAZENEUVE (PAUL). Cuprous and Mercurous derivatives of Diphenylcarbazon	i, 465
HOPKINS (F. GOWLAND). Preparation of a pure Albumin from White of Egg	i, 466
COHN (RUDOLF). Formation of Bases from Albumin	i, 466
HERLANT (LÉON). Nucleic acids from various sources	i, 466
KOSSEL (ALBRECHT) and FR. KUTSCHER. Proteids	i, 466
PAAL (CARL). Glutinspeptone, Hydrobromide, and Hydriodide	i, 467
STEUDEL (H.) and ALBRECHT KOSSEL. Thymine	i, 467
LAPICQUE (LOUIS) and H. GILARDONI. Amount of Iron present in the Hæmoglobin of the Horse	i, 467

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
XCV.—Asymmetric Optically Active Sulphur Compounds. <i>d</i> -Methylethylthetine Platinichloride. By WILLIAM JACK- SON POPE and STANLEY JOHN PEACHEY (<i>Continued</i>) . . .	1073
XCVI.—A New Method of Estimating Potassium. By RICHARD HALIBURTON ADIE and THOMAS BARLOW WOOD . . .	1076
XCVII.—Notes on the Chemistry of Chlorophyll. By LEON MARCHLEWSKI, Ph.D., and C. A. SCHUNCK . . .	1080
XCVIII.—Sulvanite, a New Mineral. By G. A. GOYDER . . .	1094
XCIX.—Acetyl and Phenacetyl Derivatives of Diethyl <i>d</i> -Tar- trate. By JOHN McCRAE and T. S. PATTERSON . . .	1096
C.—Estimation of Atmospheric Carbon Dioxide. By JAMES WALKER	1110
CI.—Periodides of Substituted Oxonium Derivatives. By J. N. COLLIE, F.R.S., and B. D. STEELE, B.Sc. (Melbourne), 1851 Exhibition Scholar	1114
CII.—Condensation of Phenols with Esters of the Acetylene Series. Part II. Action of Phenols on Ethyl Phenylpro- piolate and Ethyl Acetylenedicarboxylate. By SIEGFRIED RUHEMANN and FRED BEDDOW, D.Sc., Ph.D. . . .	1119
CIII.—Vapour Pressures, Specific Volumes, and Critical Constants of Diisopropyl and Diisobutyl. By SYDNEY YOUNG, D.Sc., F.R.S., and EMILY C. FORTY, B.Sc. . . .	1126
CIV.—Vapour Pressures, Specific Volumes, and Critical Con- stants of Normal Octane. By SYDNEY YOUNG, D.Sc., F.R.S.	1145

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
MARKOWNIKOFF (WLADIMIR B.). Quaternary Paraffins. II.	i, 469
SABATIER (PAUL) and JEAN B. SENDERENS. Hydrogenation of Ethylene in the presence of reduced Metals.	i, 469
CHAVASTELON (R.). Action of Acetylene on Cuprous Chloride dissolved in Potassium Chloride solution.	i, 470
CHAVASTELON (R.). Crystalline compounds of Acetylene with Cuprous and Potassium Chlorides	i, 470
CHAVASTELON (R.). Mode of formation of the compounds $C_2H_2(Cu_2Cl_2)_n$, KCl and $C_2H_2[(Cu_2Cl_2)_n, KCl]_n$	i, 470
SABATIER (PAUL) and JEAN B. SENDERENS. Hydrogenation of Acetylene in presence of reduced Iron and Cobalt	i, 470
SABATIER (PAUL) and JEAN B. SENDERENS. Hydrogenation of Acetylene and Ethylene in the presence of finely divided Platinum.	i, 471
SABATIER (PAUL) and JEAN B. SENDERENS. Action of reduced Nickel on Acetylene.	i, 471
FISCHER (ALOIS) and BERTHOLD WINTER. Action of Sulphuric Acid on Dimethylpropanediol	i, 472
CHARON (ERNEST) and C. PAIX-SEAILLES. A product of the decomposition of Glycerol Diiodohydrin	i, 472
MAQUENNE (LÉON). Partial synthesis of <i>l</i> -Erythritol	i, 472
TAVERNE (H. J.). Methyl Ester and Amide of <i>d</i> -Valeric acid (Methyl-2-butanolic acid), and the solubility of its Silver salt	i, 472
THOMS (HERMANN). Telfairia Oil	i, 473
BIILMANN (EINAR) [and in part BJERRUM]. Anhydrous Acrylic acid.	i, 473
DOEBNER (OSCAR [GUSTAV]). Glyoxylic acid	i, 473
BOUVEAULT (LOUIS). Ethyloxalic Anhydride	i, 474
BOUVEAULT (LOUIS). Synthesis of higher Homologues of Ethyl Acetoacetate and Acetylacetone	i, 474
BLAISE (EDMOND E.). $\alpha\beta$ -Dimethylglutolactonic acid	i, 474
MARKOWNIKOFF (WLADIMIR B.). Oxidation of Cyclic compounds: α -Methyladipic acid	i, 475
CONRAD (MAX). Synthesis of $\alpha\alpha$ -Dimethylglutaconic acid	i, 475
HALLER (ALBIN) and G. BLANC. Synthesis of Ethyl β -Cyano- $\alpha\alpha$ -dimethyltricarballoylate and $\alpha\alpha$ -Dimethyltricarballoylic acid	i, 475
GULEWITSCH (WLADIMIR VON). Interaction of Ammonium Cyanide with Acetone	i, 476
RUFF (OTTO) and GERHARD OLLENDORFF. Degradation of <i>d</i> -Galactose and of Lactose: <i>d</i> -Lyxose and Galactoarabinose	i, 476
RODEWALD (HERMANN) and A. KATTEIN. Specific heat of Wheat Starch as a function of Hydration and Temperature	i, 477
RODEWALD (HERMANN) and A. KATTEIN. Natural and Artificial Starch grains	i, 477
RODEWALD (HERMANN). "Swelling" (Quellung) and Wetting	i, 477
SCHULZ (FRIEDRICH N.) and FRITZ DITTHORN. Galactosamine, a new Amino-sugar as a decomposition product of the Glucoprotein of the Albuminous Gland of the Frog	i, 478
HORNEL (M.). Halogen derivatives of Hexamethylenetetramine	i, 478
FRERIOHS (GUSTAV) and HEINRICH BECKURTS. The Thiocyanosacetic acids	i, 478
MUTHMANN (WILHELM) and E. SCHRÖDER. Cyanoselenium compounds	i, 479
ANDREASCH (RUDOLF). Methylvioluric acid and Methylidilituric acid	i, 479

	PAGE
PARTHEIL (ALFRED) and E. MANNHEIM. Mercury Antimonide and Stibonium compounds	i, 479
KAUFFMANN (HUGO). Ring-system of Benzene	i, 480
HOLLEMAN (ARNOLD F.) and B. R. DE BRUYN. Nitration of Nitrobenzene	i, 481
BLANKSMA (J. J.). General method for preparing Sulphonic derivatives by means of Disulphides	i, 482
REY (HERMANN). The number of Isomeric Naphthalene derivatives	i, 482
CURTISS (RICHARD SYDNEY). Action of Nitrous acid on Ethyl Anilino-malonate	i, 482
DIECKMANN (WILHELM). Behaviour of Phenylcarbimide with Ethyl Acetoacetate	i, 482
JACKSON (C. LORING) and R. W. FULLER. Constitution of Di- <i>p</i> -bromobenzylcyanamide	i, 482
MEYER (WILHELM). Action of Cyanogen on Aromatic Amines	i, 483
FISCHER (EMIL) and ADOLF WINDAUS. Formation of Quaternary Ammonium compounds in the case of Brominated Homologues of Aniline	i, 484
VAUBEL (WILHELM). Quinquevalent Nitrogen	i, 485
SCHROETER (GEORG) and M. PESCHKE. New Hydroxylamine derivatives of Formic acid	i, 485
NIEZKI (RUDOLF) and WILHELM PETRI. Constitution of <i>iso</i> Purpuric acid	i, 485
COUSIN (H.). Action of Nitric acid on Trichloroguaiacol	i, 487
PSCHOER (ROBERT) and C. SUMULEANU. Synthesis of Dimethylmorphol and of <i>iso</i> Methylmorphol	i, 487
VONGERICHTEN (EDUARD). Identity of Dimethylmorphol and of 3:4-Dimethoxyphenanthrene	i, 488
PSCHOER (ROBERT) and BERNHARD JABOKEL. Synthesis of 4-Hydroxyphenanthrene	i, 488
PSCHOER (ROBERT) and WALTER BUCKOW. Synthesis of 2:3-Dimethoxyphenanthrene	i, 489
SODEN (HUGO VON) and WILHELM ROJAHN. An Aromatic Alcohol in German Oil of Roses	i, 489
LEBEDEFF (S.). <i>o</i> -Methoxyphenyltrichloromethylcarbinol	i, 490
DRBOGLAUF (A.). Synthesis of Styryltrichloromethylcarbinol, and the action of 5 per cent. Aqueous Potassium Hydroxide on it	i, 490
MONTAGNE (P. J.). Action of Anhydrous Nitric acid on the Isomeric Chlorobenzoic acids and their derivatives	i, 491
AUWERS (KARL). Intramolecular rearrangement	i, 492
WHEELER (HENRY L.). Sodium Salts of the Amides	i, 492
ERLENMEYER (EMIL, jun.). Action of Benzyl Cyanide on Ethyl Cinnamate	i, 493
EINHORN (ALFRED) and MAX OPPENHEIMER. New Drugs: Glyciny derivatives of the Esters of Aromatic Amino- and Hydroxyamino-acids	i, 493
TROEGER (JULIUS) and ERICH EWERS. Alkylthiosulphonated Ethyl Acetoacetate	i, 494
BOUGAULT (J.). Oxidation of Anethole and Analogues (<i>iso</i> Safrrole, <i>iso</i> Apiole, &c.) containing Propenyl side chains	i, 495
BOUGAULT (J.). Methoxyhydratropic acid obtained by oxidising Anethole. Identity of Phloretic and Hydroparacoumaric acids	i, 495
HALLER (ALBIN) and G. BLANC. Alkyl salts of α -Cyano- β -alkyloxy-, β -phenyl-, and β -benzyl-acrylic acids	i, 496
SIMONS (HUGO) and G. WENZEL. Tribromocoumarin and its derivatives. II.	i, 496
BRÜHL (JULIUS WILHELM). Tautomeric Changes in Solution	i, 497
KLOBB ([CONSTANT] TIMOTHÉE). Synthesis of <i>S</i> -Benzoyl- α -methylpropionic (Phenylmethylbutanonic) acid	i, 497
LIMPRICHT (HEINRICH) and OTTO WIEGAND. <i>p</i> -Toluoyl- <i>o</i> -benzoic acid	i, 498
HEFFTER (ARTHUR) and W. FEUERSTEIN. Embellie acid	i, 498
MASSOL (GUSTAVE). Thermochemistry of Gallic acid	i, 499
MASSOL (GUSTAVE). Thermochemistry of 2:3:4-Trihydroxybenzoic acid	i, 499
DOEBNER (OSCAR [GUSTAV]). Synthesis of Phthalidetricarboxylic and Phthalidedicarboxylic acids: a new passage from the Aliphatic to the Aromatic Series	i, 499

	PAGE
BAMBERGER (EUGEN). Oxidation of Benzaldoxime	i, 500
THIELE (JOHANNES) and ERNST WINTER. Oxidation in presence of Acetic Anhydride and Sulphuric acid	i, 500
THIELE (JOHANNES) and HEINRICH EICHWEDE. Action of Ethyl Nitrite on Trisubstituted Phenols	i, 501
BLOCH (M.) and STANISLAUS VON KOSTANECKI. 2-Methylchromone	i, 502
KRONBERG (H.) The Friedel-Crafts Reaction	i, 502
COHENNER DE CONINCK (WILLIAM) and DERRIEN. New derivatives of Benzophenone	i, 502
DINGLINGER (PAUL). Derivatives of <i>p</i> -Aminobenzophenone	i, 503
LAGUET (B.). Action of Ethyl Mercaptan on some Diatomic Ketones	i, 503
CZAJKOWSKI (J.), STANISLAUS VON KOSTANECKI, and JOSEF TAMBOR. Synthesis of 1 : 3 : 4'-Trihydroxyflavone	i, 504
HARRIES (CARL D.). Oxidation of the Oximes of Unsaturated compounds	i, 504
THIELE (JOHANNES) and ERNST WINTER. Action of Acetic Anhydride and Sulphuric acid on Quinones	i, 504
GRAEBE (CARL) and F. HÖNIGSBERGER. Oxidation Products of Chrysene	i, 505
PARTHEIL (ALFRED) and A. VAN HAAREN. Influence of the amount of Water on the Specific Rotation of Alcoholic Solutions of Camphor. Valuation of Spirit of Camphor	i, 507
MAHLA (FRIEDRICH) and FERDINAND TIEMANN. Decomposition Products of Campherimine	i, 507
BARBIER (PHILIPPE). Citral and its Isomeric Forms	i, 508
KONDAKOFF (IWAN L.) and IWAN SCHINDELMEISER. Syntheses in the Terpene Series	i, 508
BOUVEAULT (LOUIS). Action of Fuming Nitric acid on Camphene	i, 508
MOKIEWSKY (WLADIMIR). Isoprene	i, 509
WALBAUM (HEINRICH). Civet, Jasmine, and Oil of Roses	i, 509
JEANCARD (PAUL) and SATIE. Essential Oil of Jasmine	i, 510
CATHELINEAU and JEAN HAUSSEER. Empyreumatic Oil of Juniper	i, 510
JEANCARD (PAUL) and SATIE. Essential Oil of Lavender and the causes of the variations in the amount of Esters contained in it	i, 510
JEANCARD (PAUL) and SATIE. Essential Oils of Neroli and Petit Grain	i, 511
BOURQUELOT (ÉMILE) and HENRI HÉRISSEY. Preparation of Gentiopicroin, the Glucoside of fresh Gentian Root	i, 511
MEULEN (H. TER). Glucosides containing Thiocarbimides	i, 511

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
CIV.—Vapour Pressures, Specific Volumes, and Critical Constants of Normal Octane. By SYDNEY YOUNG, D.Sc., F.R.S. (<i>Continued</i>)	1149
CV.—Separation of Neobornylamine from Bornylamine. By MARTIN ONSLOW FORSTER and JAMES HART-SMITH, A.R.C.S.	1152
CVI.—Aminoamidines of the Naphthalene Series. (Third Communication on Anhydro-bases.) By RAPHAEL MELDOLA, F.R.S., and LEWIS EYNON, A.I.C.	1159
CVII.—Note on the Elimination of a Nitro-group during Diazotisation. By RAPHAEL MELDOLA and ELKAN WECHSLER	1172
CVIII.—A Contribution to the Stereochemistry of Sulphur: an Optically Active Sulphine Base. By SAMUEL SMILES, B.Sc.	1174
CIX.—Condensation of Phenols with Esters of the Acetylene Series. Part III. Synthesis of Benzo- γ -pyrone. By SIEGFRIED RUHEMANN and H. E. STAPLETON, Scholar of St. John's College, Oxford	1179
CX.—Contributions to the Chemistry of Hydrotetrazines and Triazoles. By OSWALD SILBERRAD, Ph.D.	1185
CXI.—Isomeric Dibenzyl Ketone Benzalanilines and Deoxybenzoin Benzalanilines. Part II. By FRANCIS E. FRANCIS, Ph.D., B.Sc., Lecturer in Chemistry, University College, Bristol	1192
CXII.—Condensation of Methyl Acetonedicarboxylate. Constitution of Orcinoltricarboxylic Esters. By F. W. DOOTSON, M.A.	1196
CXIII.—Contribution to the Chemistry of the Aromatic Metadamines. By GILBERT THOMAS MORGAN, D.Sc.	1202
CXIV.—Action of Aromatic Aldehydes on Derivatives of β -Naphthylamine. By GILBERT THOMAS MORGAN, D.Sc.	1210
CXV.—Action of Hydrogen Peroxide on Carbohydrates in the Presence of Ferrous Salts. II. By ROBERT SELBY MORRELL, M.A., Ph.D., and JAMES MURRAY CROFTS, M.A., B.Sc.	1219

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry.

	PAGE
MABERY (CHARLES F.) [and in part EDWARD J. HUDSON, S. TAKANO, and W. O. QUAYLE]. Composition of Petroleum	i, 533
SABATIER (PAUL) and JEAN B. SENDERENS. Action of Finely Divided Platinum, Cobalt and Iron on Acetylene and Ethylene	i, 534
BASCHIERI (A.). Behaviour of Acetylene on Oxidation	i, 534
CROSS (CHARLES F.), EDWARD J. BEVAN, and TH. HEIBERG. Action of Hydrogen Peroxide on Unsaturated Hydrocarbons	i, 534
BILTZ (HEINRICH) and ERICH KEDESZY. Nitrotri-iodoethylene and Dinitro-di-iodoethylene	i, 534
GUSTAVSON (GABRIEL). Influence of Hydrobromic Acid on the Rate of Action of Bromine on Trimethylene	i, 535
ECHSNER DE CONINCK (WILLIAM). Solutions of Ferric Chloride in Organic Solvents	i, 535
ZUNINO (V.). Action of Potassium Hydroxide on Epichlorhydrin in the Presence of Alcohols. II.	i, 535
WENZEL (G.). Action of Bromine and Carbon Disulphide on Sodium Methylene Compounds	i, 536
MELIKOFF (PETR. G.). Haloid Hydroxy-acids	i, 536
DOEBNER (OSCAR). Synthesis of Sorbic Acid	i, 536
SABBATANI (LUIGI). Oxidation of Citric Acid and Citrates with Potassium Permanganate or with Iron	i, 536
HENRY (LOUIS). Reactions of Paraformaldehyde	i, 537
HENRY (LOUIS). Methyl Ethyl Ketone	i, 537
HILL (HENRY B.), CHARLES A. SOOH, and GEORGE OENSLAGER. Condensation of Nitromalonic Aldehyde with Ketones and Ketonic Acids	i, 538
NEUBERG (CARL). An Optically Inactive Pentose in Urine	i, 539
FISCHER (EMIL) and OTTO RUFF. Conversion of Gulonic Acid into Xylose and Galactose	i, 539
NIEBEL (W.). Oxidation Product of Glycogen with Bromine	i, 540
FEIST (FRANZ). Sugar obtained by the Hydrolysis of Strophanthin. IV.	i, 540
NASTUKOFF (A.). Oxycelluloses and the Molecular Weight of Cellulose	i, 540
LUCK (A.) and CHARLES F. CROSS. Cellulose Nitrates	i, 541
PRIOR (EUGEN) and D. WIEGMANN. Preparation and Properties of Diastase-Achroodextrin III	i, 541
MASCETTI (E.). Ammonio-oxycobalt Thiocyanates	i, 541
LACHMAN (ARTHUR). Preparation of Zinc Ethyl	i, 542
LOISELEUR (H.). Pallado-oxalic Acid and Pallado-oxalates	i, 542
JÖRGENSEN (SOFUS M.). Constitution of Platinum Bases	i, 542
BIILMANN (EINAR). Action of Allyl alcohol on Potassium Platinochloride	i, 543
WINTREBERT (L.). Osmyloxalates	i, 543
LUNGE (GEORG) and J. AKUNOFF. Action of a Mixture of Benzene Vapour and Hydrogen on Platinum and Palladium Black	i, 543
KAUFFMANN (HUGO). The Number of Isomeric Naphthalene Derivatives	i, 544
BOERIS (GIOVANNI). Crystalline Form of Toluene	i, 544
TINGLE (ALFRED). Reactions of Aniline and of Hydroxylamine with Hydroxy- and Unsaturated Compounds	i, 544
VAUBEL (WILHELM). Removal or Substitution of Sulphonic Groups in Naphthalene Derivatives by Nascent Chlorine	i, 544
ZINCKE (THEODOR). Action of Nitrous Acid on Bromo- and Chloro-derivatives of Phenols	i, 545

	PAGE
KONTA (KARL). Derivatives of 2-Methyl-1:3:4:5-phenetrol . . .	i, 545
HERSIG (JOSEF) and F. AIGNER. Monoalkyl Ethers of Phloroglucinol . . .	i, 545
PESCI (LEONE). Organo-mercury Compounds of Benzoic Acid . . .	i, 546
GRAEBE (CARL). Commercial Dichlorophthalic Acid . . .	i, 546
GRAEBE (CARL) and S. GOUREVITZ. 3:6-Dichlorophthalic Acid . . .	i, 547
GRAEBE (CARL). Formation of Esters in the Phthalic Acid Group . . .	i, 547
COHN (GEORG). Salol . . .	i, 548
BOUGAULT (J.). Synthesis of <i>p</i> -Methoxyhydratropic Acid . . .	i, 548
ZAHN (OSKAR). <i>o</i> -Aminosalicylic Acid . . .	i, 549
ERLENMEYER (EMIL), jun. α -Amino-acids . . .	i, 549
MOORE (F. J.). Removal of a Sulpho-group by Reduction . . .	i, 550
PERATONER (ALBERTO) and G. LEONARDI. Pyrone Group. VI. Con- stitution of Meconic, Comenic, and Pyromeconic Acids . . .	i, 550
PERATONER (ALBERTO) and G. LEONARDI. Pyrone Group. VII. A Con- densation Product of Acetylcarbinol . . .	i, 551
OLIVERI-TORTORICI (RICCARDO). Ethyl Dimethylpyrnedicarboxylate . . .	i, 552
POMERANZ (CESAR). Velocity of the Reaction between Sodium Hydroxide and Benzaldehyde . . .	i, 552
BENTLEY (WILLIAM B.). Action of Nitric Acid on Vanillin . . .	i, 552
ANGELI (ANGELO). Nitroketones and Orthonitro-derivatives . . .	i, 552
OLIVERI-TORTORICI (RICCARDO). Action of Nitrogen Tetroxide on Quinonedioximes . . .	i, 553
MARFORI (PIO). Hydroxymethylanthraquinones . . .	i, 553
WAGNER (GEORG) and WAULAW BRYKNER. Bornylene, a New Terpene . . .	i, 554
RIMINI (ENRICO). Isocamphor . . .	i, 554
RIMINI (ENRICO). Researches in the Camphor Group . . .	i, 555

ERRATA.

VOL. LXXVIII. (ABSTR., 1900).

PART I.

Page	Line	
443	8*, 4*, 3*	} for "lactone" read "anhydride."
444	3, 2*	
535	15	
		,, "or Trimethylene" read "on Trimethylene."

PART II.

461	18	for "Methyl Acetate" read "Ethyl Ether."
461	28	,, "ethyl acetate" read "ethyl ether."
474	13	,, "60°" read "- 60°."
540	11*, 9*	,, "Hg ₂ K" read "Hg ₂ Na."
540	10*	,, "Hg ₂ K" ,, "Hg ₂ Na."

* From bottom.

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
CXV.—Action of Hydrogen Peroxide on Carbohydrates in the Presence of Ferrous Salts. II. By ROBERT SELBY MORRELL, M.A., Ph.D., and JAMES MURRAY CROFTS, M.A., B.Sc. (<i>Continued</i>)	1221
CXVI.—The Hydroxyphenoxy- and Phenylenedioxy-acetic Acids. By W. CARTER and W. TREVOR LAWRENCE, B.A., Ph.D.	1222
CXVII.—Specific Gravities of the Halogens at their Boiling Points, and of Oxygen and Nitrogen. By JULIEN DRUGMAN, Ph.D., and WILLIAM RAMSAY, F.R.S.	1228
CXVIII.—Hydroferrocyanic Acid. By KENDALL COLIN BROWNING, B.A.	1233
CXIX.—The Nature of Metal-ammonia Compounds in Aqueous Solution. Part I. By H. M. DAWSON and J. McCRAE	1239

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry

KRAFFT (FRIEDRICH). Configuration and Classification of Aliphatic Compounds	i, 577
MABEY (CHARLES F.) and D. M. BUCK. Hydrocarbons in Heavy Texas Petroleum	i, 577
STRÖM (KNUT T.). Norwegian Tar	i, 577
MOUNEYRAT (ANTOINE). General Method for the Preparation of Halogen Derivatives of Aliphatic Hydrocarbons	i, 577

	PAGE
DONV-HÉNAULT (OCTAVE). Electrolytic Syntheses of Organic Substances. II. (Iodoform)	i, 577
AUGER (VICTOR). New Method for the Preparation of Nitromethanes	i, 578
MARKOWNIKOFF (WLADIMIR B.) and WLADIMIR TSCHERDINTSEFF [and in part EFIMOFF]. Tertiary Derivatives of Heptanaphthene [Methylcyclohexane]	i, 578
MARKOWNIKOFF (WLADIMIR B.). Secondary Derivatives of Heptanaphthene [Methylcyclohexane]	i, 579
BAMBERGER (MAX) and ANTON LANDSIEDL. Erythritol in <i>Trentepohlia Jolithus</i>	i, 579
CAVALIERE (JACQUES) and EUGÈNE PROST. Some Phosphoric Esters	i, 579
BÉHAL (AUGUSTE). Mixed Anhydrides of Formic Acid	i, 580
FREUNDLICH (J.) and OTTO ROSAUER. Reduction of Oleic to Stearic Acid by the Aid of Nascent Hydrogen	i, 581
BLANC (G.). Campholytic and <i>iso</i> Lauronic Acids	i, 581
BOETTINGER (CARL). Glycollic and Glyoxylic Acids	i, 582
PERDRIX (LÉON). Oxidation of Dibasic Acids of the Aliphatic Series by Acid Potassium Permanganate	i, 582
WOLFF (LUDWIG). Substitution Products of Tetronic Acid	i, 582
WOLFF (LUDWIG) and A. LÜTTINGHAUS. Nitrotetronic Acid, Amino-tetronic Acid, and their Derivatives	i, 583
WOLFF (LUDWIG) and A. LÜTTINGHAUS. Phenylhydrazones of Diketobutyrolactone	i, 584
WOLFF (LUDWIG) and WILLY HEROLD. Behaviour of α -Methyltetronic Acid towards Diazobenzene Chloride	i, 585
WOLFF (LUDWIG) and EDUARD FERTIG. Iodotetronic Acid and Sulphotetronic Acid	i, 585
BLANC (G.). Action of Aluminium Chloride on Camphoric Anhydride	i, 586
MICHAILENKO (JAKOV I.) and W. P. JAVORSKY. Action of Zinc on a Mixture of Ethyl Bromoisobutyrate and Ethyl Formate. II. Action of Hydriodic, Hydrobromic, and Sulphuric Acids on β -Hydroxy- α -tetramethylglutaric Acid	i, 586
OLIVERI-TORTORICI (RICCARDO). Researches in the Pyrone Group. VIII. Diethyl Comenate	i, 587
TOWER (OLIN F.). [Tartrates of Nickel and Cobalt]	i, 587
PONZIO (GIACOMO). Conversion of Ketones into α -Diketones. V. <i>iso</i> Propyl <i>iso</i> Butyl Ketones	i, 588
PONZIO (GIACOMO). Acetyldioximes of α -Diketones	i, 588
KOENIGS (WILHELM) and EDUARD KNORR. Derivatives of Dextrose	i, 588
VIGNON (LÉO). Nitrocelluloses	i, 589
PETIT (PAUL). Dextrins of Saccharification	i, 589
LOOQUIN (R.). Action of Hexamethylenetetramine on the Esters of Chloroacetic and Bromoacetic Acids	i, 589
WALLACH (OTTO) [and in part L. OTTEMANN]. Terpenes and Ethereal Oils: Ring Disruption among Cyclic Ketones	i, 589
HIS (jun.) and PAUL. Behaviour and Reactions of Uric Acid and its Salts in Solutions	i, 591
HOFMANN (KARL A.). Pentacyano-iron Compounds	i, 591
ECHSNER DE CONINCK (WILLIAM). Isomerism in the Aromatic Series	i, 592
ORTOLEVA (GIOVANNI). Preparation of Iodoso- and Iodoxy-derivatives	i, 592
HABER (FRITZ). Electrolytic Reduction of Nitro-compounds	i, 592
ZALOZIECKI (ROMAN) and LUDWIG GANS. Hydrocarbons with High Melting Points from the Last Distillates of Petroleum	i, 593
FRIEDL (ARTHUR). Amino-derivatives of Methylphloroglucinol	i, 593
RICHARD (E.). Compounds of Bismuth with Phenols	i, 593
BORSCHKE (WALTER). Action of Benzenediazonium Chloride on Alkaline Solutions of Nitrosophenol	i, 594
AUGER (VICTOR). Diphenylmethyl Oxide	i, 594
HERZIG (JOSEF), JACQUES POLLAK, and KARL ROHM. Bromo-derivatives of the Homologous Phloroglucinols	i, 596

	PAGE
DELAGE (MARCEL). Pyrogallolsulphonic Acids	i, 595
WALBAUM (HEINRICH). Occurrence of Methyl Methylantranilate in Oil of Mandarins	i, 595
SCHULTZE (ALBERT). Benzoyl Derivatives of Amino-acids formed by the Fission of Proteids	i, 595
MASELLI (C.). Synthesis of Hydroxymethyl- <i>o</i> -benzoicsulphinide	i, 596
MAZZARA (GIROLAMO) and V. BERTOZZI. 2-Chloro-3-hydroxybenzoic and 2:6-Dichloro-3-hydroxybenzoic Acids	i, 596
WISLICIENUS (WILHELM). Isomerism of the Formylphenylacetic Esters	i, 597
GRIGOROWITSCH (P.). Synthesis of β - <i>p</i> -isoPropylphenyl- α -methylhydracrylic Acid	i, 597
SEVERIN (ÉMILE). Products of Condensation of Dichlorophthalic Anhydride with Diethylaniline	i, 598
LIMPRICHT (HEINRICH). <i>p</i> -Toluoyle- <i>p</i> -benzoic Acid and <i>pp</i> -Benzophenone-dicarboxylic Acid	i, 598
LIMPRICHT (HEINRICH). <i>o</i> -Xylophthaloylic Acid and Phthaloylphthalic Acid	i, 599
LIMPRICHT (HEINRICH). <i>p</i> -Toluoyle- β -propionic Acid	i, 600
MASSOL (GUSTAV). Thermal Study of Protocatechuic or 3:4-Dihydroxybenzoic Acid. Influence of Phenolic Hydroxyl	i, 600
RUSSIG (FRIEDRICH). Orthocarboxylic Acids and other Derivatives of 1:2- and 1:4-Dihydroxynaphthalene	i, 601
RAIKOW (P. N.). Double Compounds of Aromatic Aldehydes and Esters with Orthophosphoric Acid	i, 602
FROBENIUS (AUG. LUDWIG). Vanillin in Vinegar-essences	i, 603
DELAURE (MAURICE). Synthesis of Benzene by the Action of Zinc Ethyl on Acetophenone	i, 603
DELAURE (MAURICE). Gradual Synthesis of the Benzene Ring	i, 603
GESCHÉ (LOUIS). Action of Potassium Hydroxide on Dypnone	i, 604
KONDAKOFF (IWAN L.) and E. LUTSCHININ. Isomerism in the Menthol Series. III.	i, 604
SODEN (HUGO VON) and WILHELM ROFAHN. Sesquiterpene of Oil of Ginger	i, 605
BAMBERGER (MAX) and EMIL VISCHNER. Natural Resins [Ueberwallungsharze]. VI. Dry Distillation of Lariciresinol	i, 605
SKRAUP (ZDENKO HANNS) [and in part H. COPONY and G. MEDANICH]. Constitution of β -isoCinchonine	i, 605
SKRAUP (ZDENKO H.) and RUD. ZWERGER. α - and β -isoCinchonine	i, 606
WULFF (G. F.). Oxidation Products of Cotarnine	i, 607
RAUWERDA (A.). Cytisine and its Alkyl Derivatives	i, 607
SCHWANTKE (ARTHUR). Crystalline Form of Histidine Dichloride	i, 608
COHN (GEORG). Tetramethyldiaminodiphenylmethane and similar Substances	i, 608
BOGERT (MARSTON TAYLOR) and AUGUST HENRY GOTTHELF. Direct Synthesis of Ketodihydroquinazolines from Orthoamino-acids	i, 608
RÜGHEIMER (LEOPOLD). Constitution of Hippuroflavin	i, 609
RÜGHEIMER (LEOPOLD) and F. FEHLHABER. Homologues of Hippuroflavin	i, 609
WILLGERODT (CONRAD). Derivation and Rational Nomenclature of the Quinopyridines	i, 610
CHARDIN (D. A.). Formation of Safranines	i, 610
CURTIS (THEODOR) [and in part with E. HAAGER, E. HARDING, A. PROFFE, and G. SPRENGER]. Reduction of Aromatic Aldazines. Synthesis of Benzylhydrazine	i, 610
SEYEWETZ (ALPHONSE). Combination of Magenta with the Sulpho-conjugated Azo-colouring Matters	i, 614
VAUBEL (WILHELM). Isomeric Forms of Diazoaminobenzenedi- <i>p</i> -sulphonic Acid	i, 615
SPIRO (KARL). Influence of Nitrogenous Substances on the Heat-coagulation of Proteids	i, 615
MAGNUS-LEVY (ADOLF). Bence-Jones Albumin	i, 615

	PAGE
OSBORNE (THOMAS BURE) and GEORGE F. CAMPBELL. Proteids of the Egg Yolk	i, 616
FERNBACH (AUG.) and L. HUBERT. Influence of Phosphates and other Inorganic Compounds on the Proteolytic Diastase of Malt	i, 616

PART II.

General and Physical Chemistry.

RUNGE (CARL). Spectrum of Radium	ii, 641
STREINTZ (FRANZ). Electrical Conductivity of Compressed Powders	ii, 641
NEERNST (WALTHER) and F. DOLEZALEK. Gaseous Polarisation in the Lead Accumulator	ii, 641
STRASSER and GAHL. Gaseous Polarisation in the Lead Accumulator	ii, 642
IMMERWAHR (CL.). Potentials of Copper Electrodes in Solutions. Copper Precipitates of importance in Analysis	ii, 642
CEOTOGINO (F.). Oxidation Potentials	ii, 642
MÜLLER (ERICH). The Discharge Potential of Chlorine Ions	ii, 643
KENDRICK (ARTHUR). Migration Constant of Sulphuric Acid	ii, 643
MÜLLER (ERICH). Apparatus for Illustrating the Migration and Separation of Ions	ii, 643
DONY-HÉNAULT (OCTAVE). Electro-synthesis of Organic Substances	ii, 644
QUINCKE (FRIEDRICH). Electrolysis of Fused Salts	ii, 644
LORENZ (RICHARD). Electrolysis of Fused Salts	ii, 644
FOERSTER (FRITZ) and H. SONNEBORN. Evolution of Oxygen at the Anode in the Electrolysis of Solutions of Alkali Chlorides	ii, 645
FRANKLIN (EDWARD C.) and CHARLES A. KRAUS. Conductivity Temperature Coefficient of some Liquid Ammonia Solutions	ii, 645

CONTENTS.

PAPERS READ BEFORE THE CHEMICAL SOCIETY.

	PAGE
CXIX.—The Nature of Metal-ammonia Compounds in Aqueous Solution. Part I. By H. M. DAWSON and J. MCCRAE (Continued)	1261
CXX.—Action of Alkalis on the Nitro-compounds of the Paraffin Series. Part II. Reactions and Constitution of Methazonic Acid and the Mode of Formation of Isoxazoles. By WYNDHAM R. DUNSTAN, F.R.S., and ERNEST GOULDING, B.Sc.	1262
CXXI.—Amount of Chlorine in Rain Water collected at Cirencester. By EDWARD KINCH, Royal Agricultural College, Cirencester	1271
CXXII.—Hexachlorides of Benzonitrile, Benzamide, and Benzoic Acid. By FRANCIS EDWARD MATTHEWS	1273
Nilson Memorial Lecture. By OTTO PETTERSSON, Professor of Chemistry in the University of Stockholm	1277
CXXIII.—Degradation of Glycollic Aldehyde. By HENRY J. HORSTMAN FENTON, M.A., F.R.S.	1294
CXXIV.—Researches on the Alkyl-substituted Succinic Acids. Part III. Dissociation Constants. By WILLIAM A. BONE and CHARLES H. G. SPRANKLING	1298
CXXV.—Genistein. Part II. By ARTHUR GEORGE PERKIN, F.R.S.E., and LOUIS HUBERT HORSFALL	1310
CXXVI.—Luteolin. Part III. By ARTHUR GEORGE PERKIN, F.R.S.E., and LOUIS HUBERT HORSFALL	1314
CXXVII.—Contributions to the Knowledge of Fluorescent Compounds. Part I. The Nitro-derivatives of Fluorescein. By JOHN THEODORE HEWITT and BRYAN W. PERKINS	1324

ABSTRACTS OF PAPERS PUBLISHED IN OTHER JOURNALS:—

PART I.

Organic Chemistry

	PAGE
PONI (PETRU). Composition of Roumanian Petroleum	i, 617
RAEMER (GUSTAV) and ADOLF SPILKER. Decomposition of Viscous Substances (Lubricating Oils) by Distillation under Pressure	i, 617
MIXTER (WILLIAM G.). Products of the Explosion of Acetylene and of Mixtures of Acetylene and Nitrogen	i, 618
HANTZSCH (ARTHUR). History of the Isonitro-compounds 	i, 618
HOFMANN (KARL A.) and JULIUS SAND. Compounds of Ethylene and Allyl Alcohol with Mercuric Salts	i, 618
ALBERDA VAN EKENSTEIN (WILLIAM) and CORNELIS A. LOBBY DE BRUYN. Some New Derivatives belonging to the Sugar Group	i, 619
ULLMANN (FRITZ) and P. WENNER. Dimethyl Sulphate as an Alkylating Agent	i, 619
BERTHELOT (MARCELLIN P. E.). Decomposition of Alkyl Nitrates and Nitroglycerol by Alkalis, and the Relative Stability of Explosives	i, 620
KISSEL (J.). Reaction of Nitrous Esters with Alcohols and Ketones in Presence of Excess of Hydrogen Chloride [in Alcoholic Solutions]	i, 620
BERGELL (PETER). Preparation of Lecithin	i, 621
THOMS (HERMANN). Constituents of Cascarilla Oil, and Undecenoic Acid	i, 622
NOYES (WILLIAM A.) and EDWARD F. PHILLIPS. Camphoric Acid. IX. Structure and Configuration of <i>cis-trans</i> -Campholytic Acid	i, 622
DIECKMANN (WILHELM). Condensations with Ethyl Acetoacetate and their Reversal	i, 623
SIMON (L. J.). New Product of the Destructive Distillation of Tartaric Acid	i, 624
SIMON (L. J.). <i>iso</i> Pyrotritaric Acid; a New Pyrogenic Product from Tartaric Acid	i, 624
TIERMANN (FERDINAND) [and MAX KERSCHBAUM]. Pinolic Acid	i, 625
SCHMALZHOFFER (F. X.). Condensation of Acetaldehyde with Propaldehyde	i, 626
CHRISTENSEN (JOSEPH C.). Boiling Points of Mixtures of Chloral and Water	i, 626
BAEYER (ADOLF VON) and VICTOR VILLIGER. Nomenclature of the Peroxides: Aldehydic Peroxides	i, 626
WOHL (ALFRED) and W. EMMERICH. Semi-aldehyde of Malonic Acid	i, 627
SALKOWSKI (ERNST L.). Fermentation of Pentoses	i, 628
ADRIANI (J. H.). Nature of Inactive Sorbose	i, 628
WEISBERG (JULIUS). Solubility of Lime in Saccharine Solutions	i, 628
SCHUKOFF (IWAN). Trehalose	i, 628
VIGNON (LÉO). Oxycelluloses of Cotton, Flax, Hemp, and Rhea	i, 628
VIGNON (LÉO) and F. GERIN. Acetyl Derivatives of Cellulose and Oxy-cellulose	i, 629
VIGNON (LÉO). Reduction of Nitrocelluloses	i, 629
KIJNER (NIC. M.). Action of Silver Oxide on Bromoamines with Tertiary Amino-Groups	i, 629
BEWAD (IWAN I.). Action of Zinc Alkyls on Nitrous Esters and Nitro-paraffins	i, 629

	PAGE
BALBIANO (LUIGI) and D. TRASCIATTI. New Derivative of Glycine . . .	i, 632
WHEELER (HENRY L.) and TREAT B. JOHNSON. Behaviour of Acylthion-carbamic Esters with Alkyl Iodides and Amines; Benzoyliminothio-carbamic Esters, Acyclic Benzoylpseudocarbamides and Benzoylcarb-amides . . .	i, 632
TUNNICLIFFE (FRANÇOIS W.) and OTTO ROSENHEIM. Salts of Uric Acid . .	i, 636
ARMSTRONG (E. FRANKLAND). 3-Ethyluric Acid . . .	i, 636
GEUNS (J. W. VAN). Explosiveness of a Mixture of Potassium Cyanide and Nitrite . . .	i, 636
NIEMCZYCKI (ST.). Three Normal Butyltoluenes [Methyl- <i>n</i> -butylbenzenes]	i, 636
SWARTS (FRÉDÉRIC). Fluorine Derivatives of Toluene . . .	i, 637
HOLLEMAN (ARNOLD F.) and B. R. DE BRUYN. Simultaneous Formation of Isomeric Substitution Products of Benzene . . .	i, 638
REVERDIN (FRÉDÉRIC) and PIERRE CRÉPIEUX. Nitration of <i>m</i> -Chloro-toluene . . .	i, 638
KUNCKELL (FRANZ) and F. GOTSCH. $\alpha\beta$ -Dichlorostyrenes and some Acetylenes . . .	i, 638
BAUR-THURGAU (ALBERT). Derivatives of Butylxylene [1:3-Dimethyl-5-butylbenzene] . . .	i, 639
BOUGAULT (J.). Action of Iodine and Mercuric Oxide on Styrene and Saffrole . . .	i, 641
HAUSER (O.) and LUDWIG VANINO. Double Salts of Bismuth Chloride with some Organic Bases . . .	i, 641
TINGLE (ALFRED). New Synthesis of Secondary Amines . . .	i, 641
BRAUN (JULIUS VON). Action of Cyanogen Bromide on Tertiary Amines. II. . .	i, 641
BRAUN (JULIUS VON). Preparation of Phenylated Guanidines from Diphenylcyanamide . . .	i, 642
MEYER (RICHARD E.) and G. VON LUTZAU. Formation and Stability of Acid Amides . . .	i, 643
CHATTAWAY (FREDERICK D.) and KENNEDY J. P. ORTON. Anilines and Anilides . . .	i, 643
MOUNEYRAT (ANTOINE). Conversion of α -Amino-acids into Phenyl-hydantoins . . .	i, 644
BRAUN (JULIUS VON). Convenient Method for the Preparation of Aromatic Thiocarbamides . . .	i, 644
VORLÄNDER (DANIEL) and A. T. DE MOUILPIED. Action of Sodium Ethoxide on Ethyl Anilinoacetate . . .	i, 644
REVERDIN (FRÉDÉRIC) and PIERRE CRÉPIEUX. Chlorination of Aceto- <i>m</i> -toluidide . . .	i, 644
BORSOHE (WALTHER). Constitution of Metapurpuric Acid . . .	i, 645
FRAPS (G. S.). Purification of Phloroglucinol . . .	i, 645
WALBRAUM (HEINRICH). Occurrence of Phenylethyl Alcohol in Rose Blossoms . . .	i, 645
SEYEWETZ (ALPHONSE). Compounds of Magenta with Acid Colouring Matters having a Basic Chromophore . . .	i, 645
FISCHER (EMIL). Resolution of Racemic Amino-acids into Optically Active Components. III. . .	i, 646
FISCHER (EMIL) and ANTOINE MOUNEYRAT. Resolution of Racemic Amino-acids into Optically Active Components. IV. . .	i, 647
PIEPES-PORATYNSKI (JAN). Polymerisation of <i>p</i> -Toluenitrile . . .	i, 648
LIEBERMANN (CARL) and C. N. RIEBER. Boiling and Subliming Points of some Allo-acids . . .	i, 648
SIMONIS (HUGO) and G. WENZEL. Bromocoumarins and their Derivatives. III. . .	i, 648
ERLENMEYER, (EMIL, jun.). Action of Phenylhydrazine and of Hydroxyl-amine on Ethyl Phenylcyanopyruvate . . .	i, 649
VORLÄNDER (DANIEL) and C. KOETTNITZ. Formation of Indigotin from Ethyl Anthranilate . . .	i, 649
BEIJERINCK (MARTINUS W.). Formation of Indigotin from Woad . . .	i, 649

STOERMER (RICHARD) [and in part HANS BAUER, BOES, VON FINCKH, GRÄFENHAN, K. P. GRÄLERT, GROSS, M. HELBIG, HERMES, KISSEL, O. RICHTER, PAUL SCHROCKENBERGER, and A. TEUDELLOFF. Synthesis and Degradation in the Coumarone Series	i, 650
KRAEMER (GUSTAV) and ADOLF SPILKER. Indene, and Coumarone Resins	i, 656
WEGSCHEIDER (RUDOLF). Esterification of Unsymmetrical Polybasic Acids. I. Esterification of Nitroterephthalic Acid	i, 657
WEGSCHEIDER (RUDOLF) and KARL BITTNER. Esterification of Unsymmetrical Polybasic Acids. II. Esterification of Bromo- and Hydroxy-terephthalic Acids	i, 658
MOSES (NATHAN). <i>p</i> -Cyanobenzyl Chloride	i, 658
STOBBE (HANS). Transformation of Coloured Unsaturated Dicarboxylic Acids into Colourless Stereoisomerides	i, 659
MEYER (RICHARD E.). Coloured Sulphur Compounds of the Diphenyl- and Triphenyl-methane Series	i, 660
MEYER (RICHARD E.) and J. SZANECKI. Coloured Sulphur Compounds of the Diphenyl- and Triphenyl-methane Series. II.	i, 660
LANDAU (JOSEF). Mixed Esters of Cochinilic Acid	i, 661
LANDAU (JOSEF). Diketohydrindene Derivatives of Cochinilic Acid	i, 661
PATERNÒ (EMANUELE). Constitution of Usmic Acid	i, 662
BILTZ (HEINRICH). Oxidation with Atmospheric Oxygen	i, 662
KUNCKELL (FRANZ) [and in part G. HECKER and G. TREUTLER]. Halogenised Aromatic Amino-ketones	i, 663
KUNCKELL (FRANZ). New Method of Preparing Aromatic Amino-ketones	i, 664
WEDEKIND (EDGAR). New Synthesis of Ketones	i, 665
SCHLOSSBERG (S.). 3-Bromo-1-indone and its Derivatives	i, 665
LANSER (THEODOR) and FRITZ WIEDERMANN. Halogen-substituted Indone Derivatives of β -Diketones	i, 666
LIEBERMANN (CARL) and L. FLATOW. Action of Iodine on Ethyl Sodio-diketohydrindenecarboxylate	i, 667
LANDAU (JOSEF). Trisdihydroxybenzoylenebenzene	i, 667
KOSTANECKI (STANISLAUS VON) and A. SEIFART. 2:2'-Dihydroxyflavone	i, 668
CRIVELLI (C.) and STANISLAUS VON KOSTANECKI. β -Methyl-2-hydroxy-chromone	i, 668
GROSSMANN (S.) and STANISLAUS VON KOSTANECKI. 4'-Hydroxyflavone	i, 669
MICHEL (FR.). 2:3-Dichloro- α -naphthaquinolyl Derivatives of β -Diketones	i, 669
HIRSCH (H.). Halogen-substituted β -Naphthaquinolyl Derivatives of β -Diketones	i, 670
DUDEN (PAUL) and W. TREFF [in part with D. HEYNSIUS]. Synthetical Bases of the Series of Terpenes and Camphors: Pyrrole Derivatives of the Camphor Group	i, 671
DUDEN (PAUL) and ALFRED E. MACINTYRE [and in part J. ROBERTSON]. Synthetical Bases of the Series of Terpenes and Camphors: Camphenamine and β - <i>iso</i> Camphor	i, 674
ANGELICO (FRANCESCO). Camphordioximes	i, 675
CZERNY (HANS). Fenchone	i, 675
SEMMLER (FRIEDRICH W.). Carvotanacetone, Tanacetone, and Terpenone, $C_{10}H_{18}O$ (from Tetrahydrocarvone)	i, 676
TYLER (CHAS. T.) and ALFRED WERTHEIMER. Oil of Turpentine	i, 676
DOWZARD (EDWIN). Viscosity of Essential Oils	i, 676
KLASON (PETER). Ethereal Oil of Fir Wood (<i>Pinus abies</i> , L.)	i, 676
ROMBURGH (PIETER VAN). Crystallised Constituent of the Essential Oil of <i>Kaempferia galanga</i> , L.	i, 677
WALBAUM (HEINRICH) and KARL STEPHAN. German Rose Oil	i, 677
SODEN (HUGO VON). Constituents of East Indian Sandalwood Oil	i, 677
MÜLLER (FRIEDRICH). East Indian Sandalwood Oil	i, 677
TSCHIRCH (ALEXANDER) and ED. BRÜNING. The Balsam of <i>Abies canadensis</i> (Canada Balsam)	i, 676
TSCHIRCH (ALEXANDER) and G. WEIGEL. The Balsam of <i>Abies pectinata</i> (Strasburg Turpentine)	i, 679

	PAGE
TSCHIRSCH (ALEXANDER) and G. WEIGEL. The Balsam of <i>Larix decidua</i> (Larch Turpentine)	i, 680
FRANCHIMONT (ANTOINE P. N.). Plumieride and its Identity with Agoniadin	i, 680
VONGERICHTEN (EDUARD). Luteolin Methyl Ether as a Product of the Hydrolysis of a Glucoside from Parsley	i, 681
TSCHIRSCH (ALEXANDER) and R. POLACCO. The Fruits of <i>Rhamnus cathartica</i>	i, 681
TSCHIRSCH (ALEXANDER) and E. HIEPE. Senna	i, 681
HILGER (ALBERT). Colouring Matter of Saffron	i, 682
CROSS (CHARLES F.), EDWARD J. BEVAN, and JOHN F. BRIGGS. Interaction of Furfuraldehyde and Caro's Reagent	i, 682
SHEEDEN (FRANK). Composition of Berberine Phosphate	i, 683
GORDIN (HARRY M.). The Alkaloids of <i>Ceanothus americanus</i>	i, 683
DECKER (HERMAN). Some Ammonium Compounds. VI. Formula of Cotarnine	i, 683
GREIMER (KARL). Poisonous Boragineæ Alkaloids	i, 683
RAUWERDA (A.). Cytisine and some of its Alkyl Derivatives	i, 684
POMMERENNE (HERBERT). Damascenine, a Constituent of the Seeds of <i>Nigella Damascena</i> , L.	i, 684
PICTET (AMÉ) and B. ATHANASESCU. Laudanosine	i, 685
PICTET (AMÉ) and A. ROTSOHY. Inactive Nicotine	i, 685
PICTET (AMÉ). Reduction of Nicotyrine to Inactive Nicotine	i, 685
PINNER (ADOLF) and ERICH KOHLHAMMER. Pilocarpine	i, 685
JOWETT (HOOPER A. D.). Constitution of Pilocarpine	i, 686
MURRILL (PAUL) and J. O. SCHLOTTERBECK. The Alkaloids of <i>Bocconia (Macleaya) cordata</i>	i, 686
HILDEBRANDT (HERMANN). Syntheses in the Animal Organism. I. Piperidine Derivatives	i, 686
SCHMIDT (ERNST) and H. HARTONG VAN ARK. Action of Bromoacetophenone on Piperidine	i, 686
BRAUN (JULIUS VON). Action of Cyanogen Bromide on Tertiary Amines. III.	i, 687
SAULMANN (FRITZ). Thiazolines and Oxazolines	i, 687

ERRATA.

VOL. LXXVII (TRANS., 1900).

Page	Line	
982	20	} for "litmus" read "lacmoid paper."
983	11	
982	5*	after "then" insert " , after neutralisation."

* From bottom.

in their nomenclature, *Nitrochinon-Phenylhydrazon*) gives neither hydrate nor hydrochloride. The existence of the sulphate shows, however, that the azophenol is capable of forming salts with strong acids.

Solutions of the azophenol in fixed alkalis and ammonia are of a distinct red shade, in fact, the difference of colour between the free phenol and its alkaline salts strongly recalls the relationship in colour between *o*-nitrophenol and its alkali salts. The sodium salt separates in red needles on concentration, and in neutral solution gives, with solutions of metallic salts, the following precipitates.

Silver Nitrate.—Light orange precipitate, practically insoluble, even in boiling water.

Magnesium Chloride.—Orange precipitate, dissolves somewhat in boiling water, and separates in groups of small needles on cooling.

Zinc Sulphate.—Bright yellow precipitate, becoming crystalline on warming, slightly soluble in boiling water.

Cadmium Sulphate.—Orange precipitate, very slightly soluble.

Mercuric Chloride.—Yellow precipitate, appreciably soluble in boiling water.

Calcium Chloride.—Orange red precipitate, very slightly soluble in boiling water.

Strontium Chloride.—Similar precipitate to that with calcium chloride, but somewhat redder in shade.

Barium Chloride.—Scarlet precipitate, very sparingly soluble in boiling water, from which it separates in very slender, long needles.

Lead Acetate.—Orange precipitate, insoluble.

Copper Sulphate.—Dirty orange precipitate, insoluble.

Cobalt Nitrate or *Nickel Chloride*.—Reddish-brown precipitate.

Manganese Sulphate.—Orange precipitate, somewhat soluble in boiling water.

Stannous Chloride.—Bright sulphur-yellow precipitate.

Ferrous Sulphate.—Dark brown precipitate, soon turning green.

Ferric Chloride.—Bright sulphur-yellow precipitate.

Aluminium Sulphate.—Bright yellow precipitate.

Chrome Alum.—Yellow precipitate, not quite so clear in shade as that with aluminium.

It is somewhat striking that the colours of the precipitates should vary so much. The very slight solubility of the barium salt contrasts strongly with that of the barium salts of benzeneazophenols containing the substituents in the benzene nucleus, which may be recrystallised easily from boiling water and are obtained as orange needles containing $4\text{H}_2\text{O}$.

The *acetyl* derivative, $\text{C}_6\text{H}_5\cdot\text{N}:\text{N}\cdot\text{C}_6\text{H}_3(\text{NO}_2)\cdot\text{O}\cdot\text{CO}\cdot\text{CH}_3$, is easily

obtained by warming 2 parts of the azophenol, 2 parts of fused powdered sodium acetate, and 5 parts of acetic anhydride for 1 hour on the water-bath. It separates in a flocculent state on pouring into water, and may be obtained as yellowish-brown prisms by recrystallisation from glacial acetic acid or benzene. It melts at 120.5° .

0.1237 gave 0.2644 CO_2 and 0.0428 H_2O . $\text{C} = 58.29$; $\text{H} = 3.85$.

0.1103 „ 14.5 c.c. moist nitrogen at 21° and 756 mm. $\text{N} = 14.89$.

$\text{C}_{14}\text{H}_{11}\text{O}_4\text{N}_3$ requires $\text{C} = 58.90$; $\text{H} = 3.89$; $\text{N} = 14.77$ per cent.

The acetyl derivative is easily soluble in acetone, ethyl acetate, or pyridine, less so in chloroform or benzene; methylated spirit dissolves it sparingly in the cold, but fairly readily on warming, as does amyl alcohol. It is sparingly soluble in ether and insoluble in light petroleum.

The *benzoyl* derivative, $\text{C}_6\text{H}_5\cdot\text{N}:\text{N}\cdot\text{C}_6\text{H}_5(\text{NO}_2)\cdot\text{O}\cdot\text{CO}\cdot\text{C}_6\text{H}_5$, is obtained when equal weights of the azophenol and benzoyl chloride are boiled gently for 1 hour. After pouring the product into water and leaving it until it has solidified, it is powdered, warmed with a little alcohol, and washed with repeated small quantities of cold alcohol on the pump. It separates from benzene in small, yellow crystals, melts at 132° , is easily soluble in hot benzene, acetone, or chloroform, sparingly so in alcohol or light petroleum, and is only dissolved in very small quantities by ether.

0.1127 gave 12.4 c.c. moist nitrogen at 13° and 764 mm. $\text{N} = 13.07$.

$\text{C}_{19}\text{H}_{13}\text{O}_4\text{N}_3$ requires $\text{N} = 12.72$ per cent.

The difference in the behaviour of benzeneazophenol on nitration, when the operation is effected with dilute acid or in concentrated sulphuric acid solution, might be explained if benzeneazophenol had the constitution, $\text{C}_6\text{H}_5\cdot\text{N}:\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{OH}$, usually assigned to it.

Phenols undergo substitution much more readily than benzene derivatives, in which no hydroxyl or amino-groups are present, and hence nitration might be expected to occur in the phenol nucleus. On the other hand, when nitration takes place in a sulphonic acid solution, a salt of the azophenol with a mineral acid is being nitrated, and if to these salts a formula is assigned, such as that which Hantzsch (*Ber.*, 1899, 32, 3091) gives to the hydrochloride,

the result is also easily explicable. Quinones are substituted with comparative difficulty, amines, on the contrary, with ease, an ortho- or a para-derivative being produced. Hantzsch, however, assigns a similar

quinonoid structure to the free azophenols, and this seems to be hardly reconcilable with the experiments just described. It may be pointed out that the colour of the free azophenols much more closely corresponds to that of their ethers and esters, which undoubtedly possess the azo-structure, than to that of their salts with mineral acids for which the structure of quinone-hydrazone derivatives is probable.

The author desires to thank Messrs. Clacher and Likiernik for help afforded in this work.

EAST LONDON TECHNICAL COLLEGE.

hard glass tube. A mixture of water and an insoluble oil was thus obtained, and the latter was separated, dried over sodium, and distilled ; it boiled practically constantly at $174\text{--}176^\circ$. On analysis :

0.2035 gave 0.6676 CO_2 and 0.1831 H_2O . C = 89.5 ; H = 9.9.

C_9H_{12} requires C = 90.0 ; H = 10.0 per cent.

The hydrocarbon was violently attacked by cold dry bromine, and after removing the excess of the latter by evaporation, a solid product was obtained which crystallised from alcohol in beautiful, glistening needles melting at $242\text{--}243^\circ$. The bromo-derivative gave the following result on analysis :

0.1575 gave 0.2510 AgBr. Br = 67.9.

Calculated for $\text{C}_9\text{H}_9\text{Br}_3$, Br = 67.3 per cent.

The properties of the hydrocarbon and its bromo-derivative indicated that it was hemimellitene or 1 : 2 : 3-trimethylbenzene. Jacobson (*Ber.*, 1886, 19, 2517) gives the boiling point of hemimellitene as $174\text{--}175.5^\circ$, and the melting point of the tribromo-derivative as 245° . In order to make the identification complete, the hydrocarbon was warmed with sulphuric acid, in which it dissolved readily, and after getting rid of the sulphuric acid by means of barium carbonate in the usual way, the barium salt of the sulphonic acid was converted into the sodium salt, and this, by treatment with phosphorus pentachloride and ammonia, was transformed into the sulphonamide. The latter is very characteristic, and crystallises in small, compact forms which aggregate together, producing long columns resembling prisms ; it melted sharply at 194° . Jacobson (*loc. cit.*) gives the melting point of hemimellitene sulphonamide as 196° .

The constitution of the hydrocarbon having thus been ascertained, no difficulty was found in identifying the acid from which it was obtained as prehnitylic acid or 2 : 3 : 4-trimethylbenzoic acid, as it agrees closely in melting point and general properties with the acid obtained by Jacobson from 1 : 2 : 3 : 4-tetramethylbenzene (*Ber.*, 1886, 19, 1214).

Our thanks are due to the Research Fund Committee of the Chemical Society for a grant defraying the cost of the material used in this work.

CHEMICAL DEPARTMENT, SCHOOL OF PHARMACY,
17, BLOOMSBURY SQUARE, LONDON, W.C.

potassium hydrosulphide is formed on passage of hydrogen sulphide through a *hot* solution of K_4S_6 , and that the liberated sulphur, at the moment of its separation, is taken up by unaltered K_4S_6 , forming the higher compound K_4S_{10} .

(3) It is to be noted that in all cases the polysulphide obtained is *richer* in sulphur than that for which the sulphur added was sufficient. This requires elucidation and two suggestions are made :

(a) All the sulphur added unites selectively with a *portion* only of the potassium hydrosulphide, forming a higher polysulphide than was designed in the experiment, and leaving potassium hydrosulphide in solution unaltered.

(b) That the formation of the higher polysulphide is due to the action of the current of hydrogen sulphide on the polysulphide first formed (see paragraph 2).

(4) It is evident on considering the results of experiments *a, e, f, g* (Series I), that it is not possible to discriminate between (a) the first product obtained on dissolving sulphur in potassium hydrosulphide, and (b) the condensing effect of the current of hydrogen sulphide on the polysulphide first formed.

(5) Attention may now be directed to the experiments of Series II, (see β, γ, δ), in which no current of hydrogen sulphide was employed. Turning to the experiment marked δ in the Table, the intention was to produce K_4S_6 , for which the sulphur added was sufficient. As a matter of fact, *the product obtained was K_4S_8 , and 50 per cent. of the hydrosulphide was found unaltered* after solution of the sulphur had been effected. The following equations represent (i) the action expected, (ii) the change which actually took place.

The validity of the latter equation seems to be established, for the proportion KHS/S on the left hand side was that existing in the experiment δ (see Table) ; and, of the three items on the right hand side, two were definitely established, the existence of K_4S_8 , and the survival unaltered of 50 per cent. of the original hydrosulphide. It would follow then, from the fact that this proportion remains unaltered, that, by natural selection, under the given experimental conditions, the relation of the reacting materials is not that of the latter equation, but the simpler one : $4KHS + S_6 = K_4S_8 + 2H_2S$.

(6) As the result of treatment of crystals of K_4S_6 and K_4S_8 , with carbon disulphide, a lower polysulphide, $K_4S_6 \cdot 10H_2O$, has been obtained, which resists further removal of sulphur by this solvent.

Furthermore, K_4S_6 is a stable polysulphide, mustard-yellow in colour, easily and completely soluble in water, and in it the following relation

exists, $K_4S_2 \cdot S_8$, that is, of the five sulphur atoms, three are in the polysulphide position. There seems, then, good reason for suggesting that the *prime product*, in the case of potassium polysulphides, is *tetrapotassium pentasulphide*, K_4S_5 , and that the other crystalline polysulphides obtained are solid solutions of sulphur in this substance.

(7) Regard must also be paid to the fact that the polysulphides of ammonium and sodium are of the same degree of complexity, which seems to indicate that the source of this complexity is in the *sulphur molecule itself*. Now, it has long been held as a fact that sulphur, at temperatures above its boiling point, possesses a vapour density corresponding to a molecular formula of S_8 , and that only as the temperature rises to 860—1040°, does it conform to the type S_2 .* During the past few years also, certain papers have appeared dealing with the molecular weight of sulphur in solution (compare Paternò and Nasini, *Ber.*, 1888, 21, 2153; Beckmann, *Zeit. physikal. Chem.*, 1890, 5, 76; Hertz, *ibid.*, 1890, 6, 358; Guglielmo, *Real. Accad. Linc.*, 1892, ii, 210; Orndorff and Terrasse, *Amer. Chem. J.*, 1895, 18, 173), and as a result of this work, the molecule of sulphur is stated to exist in solution as S_8 , S_8 , or S_8 .

Now the simplest expressions that can be written involving the action of such molecular groupings, and limited by the observed experimental behaviour of potassium hydrosulphide, are as follows:

Of these reactions, (2) and (3) have been already obtained, but for (1) and (4) the experimental conditions are not yet known.

A small portion of this work was carried out at the Royal Naval College, Greenwich, with the aid of Dr. W. J. McKerrow, and the remainder in the Davy-Faraday Research Laboratory of the Royal Institution. The author's thanks are given to the Managers of the Royal Institution for this privilege, and to Dr. A. Scott for kindly criticism and advice received during the course of the investigation.

THE DAVY-FARADAY RESEARCH LABORATORY
OF THE ROYAL INSTITUTION.

* Biltz (*Ber.*, 1888, 21, 2013) does not, however, consider that the existence of gaseous molecules S_8 can be established. He finds the vapour density varies *gradually* with the temperature.

as Caro has stated that he is engaged in completing his discovery, we have not thought it right to extend our experiments in this direction. We may mention, however, that solutions containing a very large proportion of the peroxidised acids may be obtained, not only by electrolysing solutions of sulphuric acid, but also by mixing sulphuric acid with hydrogen peroxide, and then concentrating by freezing out the hydrate $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$.

If our conclusion be accepted, it will follow that the account given by Berthelot, and, in fact, by all who have studied the acid, applies to 'pertetrasulphuric acid' rather than to 'perdisulphuric acid,' which appears under all conditions to be by far the minor product and the less stable, although its salts are more stable than those of 'pertetrasulphuric acid.' The production of 'perdisulphates' on electrolysing solutions of acid sulphates, whilst solutions of sulphuric acid yield chiefly 'pertetrasulphates,' is of interest as an indication that the electrolysis proceeds on very different lines in the two cases.

Attention may also be directed to the fact that, inasmuch as the persulphuric acids are formed by the interaction of sulphuric acid and hydrogen peroxide, it is clear that the affinity of hydrogen peroxide must be greater than that of water for sulphuric anhydride.

In conclusion, the authors desire to express their thanks to Dr. Armstrong, at whose suggestion the research was carried out, and to whom they are indebted for much valuable help during the whole course of the work.

CHEMICAL DEPARTMENT,
CENTRAL TECHNICAL COLLEGE,
EXHIBITION ROAD, LONDON, S. W

[It is proposed to extend the method here described to the study of the peroxides of other acids. H. E. A.]

0.1109 gave 0.2002 CO₂ and 0.0724 H₂O. C = 49.24; H = 7.25.

C₁₅H₂₆O₆S₂ requires C = 49.18; H = 7.10 per cent.

0.4296 gram made up to 25.1 c.c. with water, gave $\alpha_D + 0.49^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 14.3^\circ$ and $[M]_D + 52.4^\circ$.

0.3843 gram made up to 25.2 c.c. with water, gave $\alpha_D + 0.43^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 14.1^\circ$ and $[M]_D + 51.6^\circ$.

Since we have previously shown (Trans., 1899, 75, 1086) that the *d*-camphorsulphonic ion has $[M]_D + 51.7^\circ$ in aqueous solution, the conclusion that we were here dealing with a pure salt and that no resolution of the base had occurred seemed justified. In order, however, to obtain further evidence, the investigation of this and the salt next described was continued as stated in our preliminary note in February (*loc. cit.*), and the more so in that our work on tin published in May (Proc., 1900, 16, 116) seemed to bear upon the points at issue. During these intervening months, larger quantities of the salt have been prepared and subjected to prolonged fractional crystallisation, with the result that a resolution has been effected. On fractionally crystallising the salt some 40 or 50 times from a mixture of absolute alcohol and ether, a sparingly soluble fraction was obtained which melted at 118–120°, and gave the following results on analysis, &c., after drying at 100°:

0.1275 gave 0.2304 CO₂ and 0.0839 H₂O. C = 49.27; H = 7.31.

C₁₅H₂₆O₆S₂ requires C = 49.18; H = 7.10 per cent.

0.7224 gram made up to 25.1 c.c. with water, gave $\alpha_D + 1.07^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 18.6^\circ$ and $[M]_D + 68.0^\circ$.

This material hence seems to be *d*-methylethylthetine *d*-camphorsulphonate, in which the anion has the molecular rotatory power $[M]_D + 16.3^\circ$.

d-Methylethylthetine *d*-Bromocamphorsulphonate,

On treating methylethylthetine bromide with silver *d*-bromocamphorsulphonate (Trans., 1899, 75, 1131) in place of the camphorsulphonate, but adopting otherwise the same procedure, an oily residue ultimately remains which readily solidifies in a vacuum desiccator. This, after several crystallisations from slightly moist acetone, is obtained as a mass of colourless, silky needles melting at 166–168°, and from analysis and rotatory power determinations appears to be a uniform product.

1.7103 lost 0.0571 at 100°. H₂O = 3.34.

0.2455 gave 0.3478 CO₂ and 0.1157 H₂O. C = 38.64; H = 5.22.

C₁₅H₂₆O₆BrS₂·H₂O requires H₂O = 3.88; C = 38.87; H = 5.83 per cent.

0.3533 gram made up to 25.0 c.c. with water, gave $\alpha_D + 1.68^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 59.5^\circ$ and $[M]_D + 275^\circ$.

Since the molecular rotatory power of the *d*-bromocamphorsulphonic ion is about $[M]_D + 270$ (Walden, *Zeit. physikal. Chem.*, 1894, 15, 196), it seemed that no resolution of the thetine had taken place. Prolonged fractional crystallisation of larger preparations of the salt from moist acetone resulted, however, in the separation of a sparingly soluble fraction having a molecular rotatory power slightly different from the above, although its composition is the same; about 30 crystallisations were undertaken in obtaining this product.

1.8654 lost 0.0666 at 100°. $H_2O = 3.57$; $1H_2O = 3.88$ per cent.

0.2385, dried at 100°, gave 0.3513 CO_2 and 0.1243 H_2O . $C = 40.17$; $H = 5.79$.

0.2293, dried at 100°, gave 0.3372 CO_2 and 0.1172 H_2O . $C = 40.10$; $H = 5.67$.

$C_{15}H_{25}O_6BrS_2$ requires $C = 40.44$; $H = 5.61$ per cent.

0.6172 gram air-dried salt, made up to 25.1 c.c. with water, gave $\alpha_D + 3.05^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 62.0^\circ$ and $[M]_D + 287^\circ$.

0.6594 gram air-dried salt, made up to 25.1 c.c. with water, gave $\alpha_D + 3.29^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 62.7^\circ$ and $[M]_D + 290.5^\circ$.

Since ammonium *d*-bromocamphorsulphonate has $[M]_D + 275^\circ$ in aqueous solutions of about the same molecular concentration as is here used, the examination of the thetine bromocamphorsulphonate, as well as the camphorsulphonate, affords very strong evidence that both contain an optically active thetine of which the ion has about $[M]_D + 15^\circ$.

On dissolving *d*-methylethylthetine *d*-camphorsulphonate of $[M]_D + 68^\circ$ or *d*-bromocamphorsulphonate of $[M]_D + 287^\circ$ to $+290^\circ$ in absolute alcohol, adding a little concentrated hydrochloric acid and then slowly stirring in an alcoholic solution of the requisite weight of platinic chloride, a yellow, crystalline platinichloride is deposited, which, after exhaustive washing with absolute alcohol, melts with profound decomposition at $177-180^\circ$. The salt is very soluble in water, but insoluble in absolute alcohol, and may be crystallised from dilute alcohol; its racemic isomeride is described by Carrara (*loc. cit.*) as melting at 167° .

0.2469 gave 0.1619 CO_2 and 0.0802 H_2O . $C = 17.89$; $H = 3.61$.

0.1104 „ 0.1391 $AgCl$. $Cl = 31.19$.

0.3558 „ 0.1015 Pt . $Pt = 28.53$.

$C_{10}H_{22}S_2O_4PtCl_6$ requires $C = 17.73$; $H = 3.25$; $Cl = 31.42$; $Pt = 28.71$ per cent.

0.2005 gram of salt from camphorsulphonate, made up to 15 c.c. with water, gave $\alpha_D + 0.14^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 4.6^\circ$ and $[M]_D + 30.8^\circ$.

0.3710 gram of salt from bromocamphorsulphonate, made up to 15 c.c. with water, gave $\alpha_D + 0.22^\circ$ in a 200 mm. tube. Whence $[\alpha]_D + 4.5^\circ$ and $[M]_D + 30.2^\circ$.

The molecular rotatory power $[M]_D + 30.5^\circ$ of the platinichloride is, as would be expected, just about twice that of the thetine ion, $[M]_D + 15^\circ$, deduced from its salts with optically active acids; in spite, however, of this close numerical agreement, we can as yet offer no guarantee that these optically active materials are free from their stereochemical isomerides.

We have thus proved that the asymmetric quadrivalent sulphur atom acts as a centre of optical activity just as does the carbon atom. Since we have previously demonstrated that the same is true of the asymmetric nitrogen (Trans., 1899, 75, 1127) and tin (Proc., 1900, 16, 42 and 116) atoms, we are now justified in concluding that the quadrivalent elements, C, Si, Ti, Zr, Ce, Th, Ge, Sn, Pb, O, S, Se, Te, Cr, Mo, W, and U of groups IV and VI, and the quinquivalent elements N, P, V, Nb, As, Sb, and Bi of group V of the periodic table are in their compounds with four or five groups of atoms, surrounded by groups arranged in tridimensional space, and can thus act as centres of optical activity.

During the present work we have had occasion to examine the conflicting records concerning isomerism possibly occurring in methyl-diethylsulphonium compounds. Krüger (*J. pr. Chem.*, 1876, [ii], 14, 205) and Nasini and Scala (*Gazzetta*, 1888, 18, 67) obtained two sulphonium iodides according as they treated diethyl sulphide with methyl iodide, or methyl ethyl sulphide with ethyl iodide. Klinger and Maassen (*Annalen*, 1888, 243, 193) consider that trimethyl- and triethyl-sulphonium iodides are produced during the latter reaction, and that the platinichlorides of these form a double salt which is naturally not identical with methyl-diethylsulphonium platinichloride. We hope shortly to publish details confirming Klinger and Maassen's conclusions, having isolated the same platinichloride from the product obtained by heating methyl ethyl sulphide with ethyl iodide and water, as by crystallising together trimethyl- and triethyl-sulphonium platinichlorides. Any objection to the tetrahedral nature of asymmetric sulphur compounds which might be based on the work of Krüger or of Nasini and Scala can therefore be set aside.

The rather large differences between the smoothed and observed volumes of both liquid and of saturated vapour at the highest temperature are due to the alteration of the temperature scale in accordance with Biot's formula for vapour pressures. It is also to be noticed that between 280° and the critical temperature, 296.2° , only one determination of volume was made. The curves above 280° are therefore of little value, especially as the alteration of form is so rapid near the critical point. The vapour pressure curve, however, shows no such change of form near the critical point, and the number of observations in that case is sufficient. Again the critical volume, being calculated from the critical density which is ascertained by the method of Cailletet and Mathias, is not rendered doubtful by the small number of observations near the critical point.

In calculating the critical density the slight curvature of the "diameter" was taken into account. The densities of liquid and of saturated vapour, the mean densities, and those calculated from the formula

$$D_t = 0.3592 - 0.0003986t - 0.000000096t^2,*$$

are given in the table on p. 1150.

The densities of saturated vapour at and below 120° were calculated from the vapour pressures on the assumption that the vapour densities are normal.

The density at the critical point, calculated from the above formula, is 0.2327 ; from the simpler formula

$$D_t = 0.3634 - 0.00044t$$

it would be 0.2331 . The difference, 0.0004 , is small, but at the lowest temperatures it would be considerable, amounting to 0.0042 at 0° .

Critical Constants.

The critical constants are as follows :

Temperature	296.2°
Pressure	18730 mm.
Density	0.2327
Volume of a gram.....	4.297 c.c.
Molecular volume	488.9 c.c.

* These constants differ slightly from those given in a paper on the law of Cailletet and Mathias recently read before the Physical Society. The agreement between the calculated and observed mean densities is somewhat better with the new constants.

Theoretical Conclusions.

The absolute temperatures and the molecular volumes of liquid and saturated vapour were read from the curves at the usual series of "reduced pressures"; from these data, the ratios of the temperatures and volumes to the critical constants were calculated, also the ratios of the actual to the theoretical densities of saturated vapour (see table on p. 1151).

A comparison of these ratios with those of normal pentane, hexane, and heptane confirms the conclusions previously reached that, for the members of a homologous series of paraffins, the ratios of the absolute temperatures at any series of corresponding pressures to the absolute critical temperatures, also the ratios of the actual to the theoretical densities at the critical points, increase slightly with rise of molecular

weight, whilst the ratios of the volumes of liquid at corresponding pressures to the critical volumes diminish slightly. The ratios of the volumes of saturated vapour to the critical volume differ very slightly from the corresponding ratios for normal heptane, and are on the whole very slightly lower; they are, however, higher than for normal hexane or pentane. It would appear then that, as a rule, these ratios increase with rise of molecular weight, but that the actual changes are too small, relatively to the experimental errors, to allow of a definite statement being made.

It is hoped that it may be possible to add a fifth member, butane, to the series of normal paraffins.

In conclusion, I wish to express my thanks to the Government Grant Committee of the Royal Society for a grant by means of which the cost of the material employed in this research was defrayed.

UNIVERSITY COLLEGE,
BRISTOL.

molecular weight of cane sugar is used. Basic lead acetate is added, the liquid filtered, the lead removed exactly by dilute sulphuric acid, and the glucosazone precipitated by phenylhydrazine at the ordinary temperature. The filtrate on warming to 50° gave a further quantity of glucosazone. The yield is about 30 per cent. of the weight of the cane sugar taken.

The substance after recrystallising twice from absolute alcohol melted at 205° with decomposition and, after drying at 105° , gave on analysis the following numbers :

0.1892 gave 0.417 CO_2 and 0.107 H_2O . $\text{C} = 60.1$; $\text{H} = 6.2$.

0.18 ,, 24 c.c. moist nitrogen at 14.5° and 752 mm. $\text{N} = 15.5$.

$\text{C}_{18}\text{H}_{22}\text{O}_4\text{N}_4$ requires $\text{C} = 60.3$; $\text{H} = 6.1$; $\text{N} = 15.6$ per cent.

Action of Potassium Persulphate on Glucose.

A 10 per cent. aqueous solution of glucose containing 0.8 per cent. of ferrous sulphate is treated with a quantity of solid potassium persulphate sufficient to provide one atom of active oxygen per gram-molecule of sugar. The solution is warmed at 40° until the ferric iron formed begins to be reduced to the ferrous state ; it is then allowed to stand at the ordinary temperature for some hours and afterwards treated with basic lead acetate, filtered, the lead removed from the filtrate by sulphuric acid, and the glucosazone precipitated at the ordinary temperature on addition of phenylhydrazine acetate. The yield of the osazone is 6 grams from 25 grams of glucose.

On recrystallisation from alcohol, the melting point was found to be 205° , and a nitrogen determination in a specimen dried at 100° gave the following numbers :

0.1725 gave 23 c.c. moist nitrogen at 15° and 760 mm. $\text{N} = 15.35$.

$\text{C}_{18}\text{H}_{22}\text{O}_4\text{N}_4$ requires $\text{N} = 15.6$ per cent.

The authors wish to state that this research was carried out with the aid of a grant from the Chemical Society Research Fund and that they are indebted to Mr. F. M. Oldham for assistance in the experimental work.

GONVILLE AND CAIUS COLLEGE LABORATORY,
CAMBRIDGE.

minations of the partial pressure of ammonia over ammoniacal salt solutions.

All the above experiments were carried out at 20°; we have also investigated the influence of temperature on the dissociation equilibrium in ammoniacal salt solutions.

Experiments have been made at 25° and at 30° with *zinc sulphate solutions*, and the results are tabulated below :

At 25°, $k = 24.9$ (see page 1243) :

Total NH ₃ in original solution. Gram-mol. per litre.	Concentration of NH ₃ in CHCl ₃ . Gram per litre.	Concentration of NH ₃ in aqueous part. Grams per litre.	Coefficient. k .
With 0.1 normal :			
0.466	0.1878	7.761	41.2
0.657	0.3090	10.910	35.3
With 0.05 normal :			
0.468	0.2499	7.744	31.0
0.562	0.3061	9.294	29.7
0.655	0.3715	10.800	29.1
With 0.025 normal :			
0.280	0.1518	4.629	30.5
0.375	0.2138	6.181	28.9
0.469	0.2754	7.728	28.0
0.566	0.3450	9.309	26.9
0.652	0.4071	10.723	26.4
0.653	0.4046	10.746	26.6

At 30°, $k = 23.2$ (see page 1243) :

Total NH ₃ in original solution. Gram-mol. per litre.	Concentration of NH ₃ in CHCl ₃ . Gram per litre.	Concentration of NH ₃ in aqueous part. Grams per litre.	Coefficient. k .
With 0.1 normal :			
0.573	0.2738	9.512	34.7
0.669	0.3375	11.088	32.8
0.765	0.4096	12.648	30.9
With 0.05 normal :			
0.384	0.2033	6.342	31.2
0.480	0.2703	7.925	29.3
0.573	0.3366	9.442	28.1
With 0.025 normal :			
0.193	0.1006	3.183	31.6
0.333	0.2339	6.309	27.0
0.575	0.3652	9.445	25.9

A comparison of the numbers obtained at these higher temperatures with those for 20° shows that the nature of the equilibrium in solution has undergone no change. The calculation of the quantity of fixed ammonia from the above experimental data shows that for 1 molecule of salt there are from 3 to 4 molecules of ammonia combined. As at 20° , also, increasing concentration of ammonia tends to make this molecular ratio approximate gradually to the limiting value of 4.

At corresponding concentrations of salt and ammonia, increase of temperature is accompanied by a decrease of the distribution-coefficient, as was also found to be the case for pure water. The variation is, moreover, of the same relative order of magnitude in the two cases, in consequence of which the question as to the influence of temperature on the dissociation of the molecular complexes in solution cannot be deduced with certainty from the experiments. We hope, however, as the result of further investigations, to be able to ascertain this influence of temperature.

LIBRARY.

The attention of Fellows is called to the times during which the Library is open for consultation.

The Library is open for consultation and for the issue of books from 10 A.M. to 6 P.M. on week days (Saturdays 10 A.M. to 4 P.M.) and on the evenings of meetings from 7 P.M. to 9 P.M.

COLLECTIVE INDEX.

Fellows can obtain from the Assistant Secretary the Collective Index for 1873-82 at the price of 10*s.*, or 11*s.* including carriage, and for 1883-92 at the price of 15*s.*, or 16*s.* including carriage. Non-members may obtain copies from Messrs. Gurney and Jackson, 1, Paternoster Row, E.C., at the respective prices of 15*s.* and £1, excluding carriage.

PROCEEDINGS OF THE CHEMICAL SOCIETY.

The attention of Subscribers to the publications of the Chemical Society is directed to the fact that a number of the papers read at the bi-monthly meetings and abstracts of the remainder, together with the discussions thereon, are now published by the Society, being usually issued to Fellows about a week after the meeting in the form of "Proceedings." The Proceedings are purchasable at a price of seven shillings and sixpence per annum, post free. Intending subscribers are requested to apply to Messrs. Gurney and Jackson, 1, Paternoster Row, E.C.

ISSUE OF JOURNAL TO SUBSCRIBERS.

The Journal—which comprises the Transactions of the Chemical Society and Abstracts of all chemical papers published elsewhere—is regularly despatched, post free, by the Publishers (Messrs. Gurney and Jackson, 1, Paternoster Row, E.C.) to subscribers—English and Foreign, within the Postal Union—who have paid to them in advance the annual subscription of 40*s.*

CASES FOR BINDING THE JOURNAL.

Cloth cases for binding the yearly volumes of the Journal can be had from the Publishers, Messrs. Gurney and Jackson, 1, Paternoster Row, E.C.

JUBILEE OF THE SOCIETY, 1891.

Copies of the Jubilee volume may be obtained from Messrs. Gurney and Jackson, 1, Paternoster Row, E.C., at the price of 6*s.*

Officers and Council.

Elected March 29, 1900.

PRESIDENT.

T. E. THORPE, C.B., D.Sc., LL.D., F.R.S.

VICE-PRESIDENTS.

WHO HAVE FILLED THE OFFICE OF PRESIDENT.

IMPORTANT NOTICES.

NOTICES TO AUTHORS OF PAPERS.

All communications for the Journal of the Society should be addressed to "The Secretaries, Chemical Society, Burlington House, W."

The attention of authors is directed to the following resolution of the Council.

"No communication shall be included in the list of titles of papers to be brought before a Meeting of the Society, unless the paper and an abstract of it are in the hands of the Secretaries at least three days before the date of the Meeting; and no announcement of titles can be made in the Proceedings until the papers have been received by the Secretaries."

In all cases, an abstract of each paper should be supplied for insertion in the Proceedings.

Authors are requested to write on their papers the address to which they wish proofs to be sent, also to send their corrected proofs without delay to the Editor, 9, Selwood Place, South Kensington, S.W., *and not to the Printers*. If authors require more than the 50 copies allowed by the Society, they should inform the Editor at the time they send in their corrected proofs, when the extra copies will be supplied at cost price.

All papers communicated to the Society, with their illustrative drawings, become the property of the Society, unless stipulation is made to the contrary. In the case of papers which are not accepted for publication in the Transactions, the Council have decided that in order to meet any claim for priority such papers shall be deposited in the Society's Archives. Authors are therefore advised to retain copies of their papers.

It has been resolved by the Council that communications made to the Society which have already appeared in any Foreign Journal shall not be published in the Society's Transactions, unless this course is specially recommended by the Publication Committee, and this recommendation approved by the Council.

ILLUSTRATIONS, AND PLATES OF CURVES.

As the Illustrations for the Journal (including curves) are, as far as possible, executed in photographic "process" work, the drawings, &c., accompanying the papers must be carefully done on a large scale on smooth white Bristol board in Indian ink, so as to admit of the blocks being prepared directly from the drawings.

Where it is necessary to employ Plates, these have to be of certain dimensions. It is desirable, therefore, that Authors who wish to illustrate their experimental results by curves, such as cannot be reproduced by "process," should arrange them so that they may be lithographed without reduction.

Information as to Illustrations and the dimensions of Plates can be obtained on application to the Editor.

Abstractors are requested to send their MSS. and corrected proofs to the Sub-editor, 39, Frognal, Hampstead, N.W., and to communicate change of address to the Printers (Messrs. Richard Clay and Sons, Limited, 8, Bread Street Hill, E.C.), as well as to the Editors.
